FRENCH MUTUAL PROVIDENT SAVINGS AND LOAN SOCIETY.

TWENTY-NINTH SEMI-ANNUAL DIVIDEND.—A dividend of nine per cent. per annum, net (0 per cent.), upon the operations of the French Savings and Loan Society for the six months ending June 30th, 1874, has, in conformity with the report of the Committee of Verification appointed by the members of the Society, been declared by the Board of Administration, at the semi-annual meeting held on the 15th instant. This dividend will be payable on and after the 17th instant, at the office of the Society, 411 Bush street. GUSTAVE MAHE,

ag15-1t Director of French Savings Bank.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 22, 1874.

VOLUME XXIX Number 8.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciencee was held on Monday evening last, President Davideon in the chair.

The following described objects were received for the Museum of the Academy:

A gigantic speciman of burrowing mollusca, of the genus *Zirfea*, probably *Zirfea crispata*, found in the northern Pacific waters, presented by Professor Herbst.

A small fish, position undetermined, from the north Pacific, contained in the same jar with the *Zirfea*.

An eel-shaped fish, known as *ophisurus Californiensis*, described and figured in the proceedings of the Academy in September, 1863, by Andrew Garrett. The specimen then noticed was said to have been captured at Margarita bay.

Specimens of a snake, not common, sometimes known as the double-headed snake, the tail being similar to the head in size only. It is perfectly harmless. Collected by Rev. S. V. Blakeslee, in the Sierras, and labeled *Winona plumbea*. There is some doubt as to the species, however, as the latter is described as lead color, while the specimen is red.

A small collection of plants from the Island of Strick, one of the Japanese group, collected by John O. Werner, and presented by W. G. Harford.

Piece of camphor-wood from the wreck of a Japanese junk on the island of Strick, received from same source

Specimen of kelp, a sea-weed used for food by the Japanese fishermen on the island of Strick. The plants of this order are usually of gigantic size. The nereocrystes of the northwest coast is said, when fully grown, to have a stem measuring 300 feet in length, which bears at its summit a huge air vessel six or seven feet long, shaped like a great cask, and ending in a tuft of upwards of fifty forked leaves, each of which is from forty to fifty feet in length.

A spherical mass of hard sandstone, found at Saucelito, by F. P. McLean. It was broken under the expectation that it might contain crystals. There was found in the center a hard, wedge shaped body, around which the concretion seemed to have been made.

A monstrous chicken, with four legs and four wings, presented by Mr. Meinecke.

Two specimens of *Estheria Californica*, a very curious entomostracous crustacean, from Alameda county, presented by James Behrens.

A day-flying moth, *Ctenucha multiforia*, presented by Dr. Blake.

Specimen of the *Torregia Californica*, belonging to the cone-bearing order *coniferæ*. This is popularly known as the California nutmeg; but, like the so-called coffee, has no affinity, either in its structure, scientific position or qualities. Presented by Mr. Yale.

Specimen of gigantic fern, *Woodwardia radicans*, presented by J. W. A. Wright.

Specimens of Chinese water-nut, from R. E. C. Stearns, with descriptive paper, suggesting the propriety of cultivating the species in this State. It is a favorite article of food with the Chinese and other Asiatic races.

A wild plant quite common in various parts of the State, having recently been brought to public attention, on the supposition that it was a species of the coffee plant, a specimen was submitted for the determination of the Academy. The herb was familiar to different members, all of whom denied its affinity, in any form, with the coffee family. It was described by Mr. Bloomer, Curator of the Museum, as the *Frangula Californica*, belonging to the order *Rhamnacea*, mostly trees and shrubs, with simple alternate leaves. The coffee plant, *Coffea Arabica*, belongs to the order *Cinchonacea*, having opposite leaves, and a well-marked and large family. It contains a very considerable number of important species. Many are among the most valuable of all remedial agents, acting as tonics, febrifuges, emetics or purgatives. Others, on the contrary, having their secretions in a state of great condensation, prove to be formidable poisons. A few only produce eatable fruit, and the *Coffea Arabica* is celebrated over all others for the agreeably stimulating properties of its berries.

Dr. Blake read a paper on "Sonorous Sand from the Island of Kausi;" referred to more at length in another column.

Professor Thomas Gnerin, an eminent hydraulic engineer, who has recently come to this Coast, read a paper "On the Construction of Canals depending upon tidal water for their supply.

Professor George Davidson, of the United States Coast Survey, read an elaborate paper "On the Transit of Venus," which was accompanied with numerous diagrams and mathematical demonstrations. The subject was treated very fully, and a complete description of the methods by which the transit would be observed, was given.

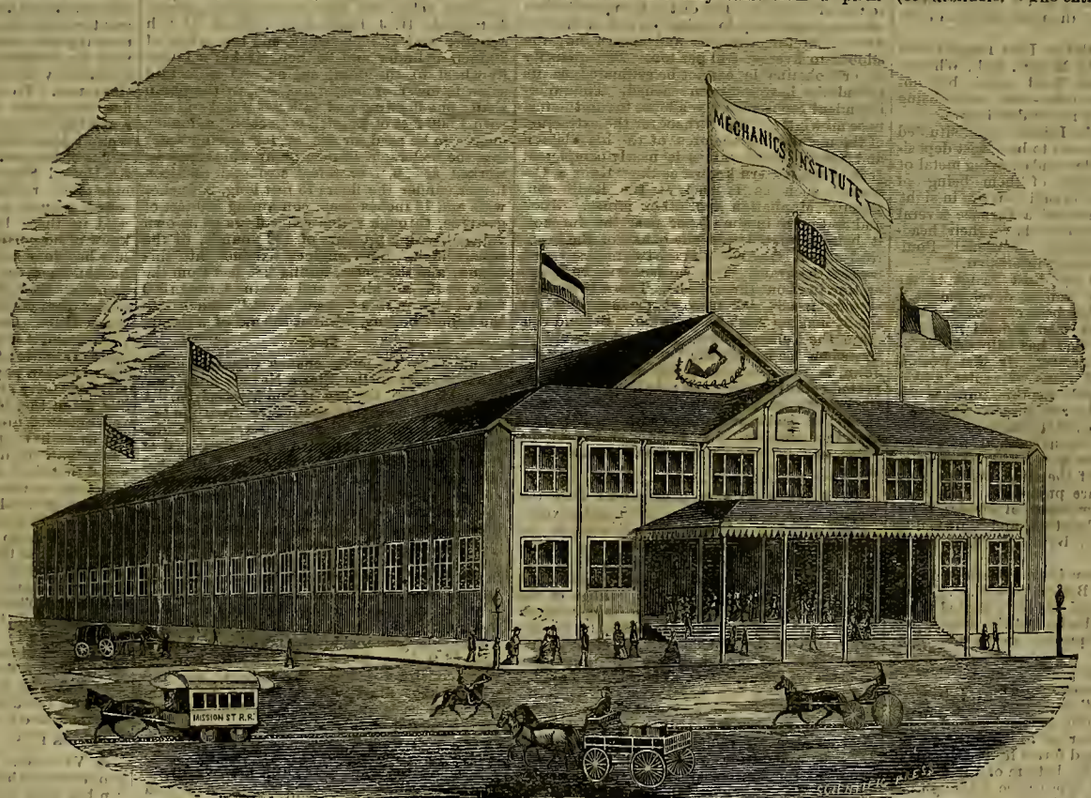
The Corresponding Secretary read communications from the Academy of Sciences of Belfast and London, requesting copies of the proceedings of the California Academy of Sciences.

Also a memorial announcing the death of Dr. Ferdinand Stoliczka, of Calcutta, an eminent palæontologist and naturalist. Also a communication from the proprietor of the property on which the shell mounds of Saucelito are situated, expressing his willingness to permit the mounds to be opened in the interest of science.

Water Nuts.

Many of our readers have probably seen the Chinese nuts, which resemble very much a pair of horns. They are very peculiar in appearance, but are not uncommon in this city, where we sometimes see a bushel in a single lot. They are the fruit or nut of an aquatic plant which grows in lakes and streams and the species *Trapa bicornis* is cultivated by the Chinese and has an extensive sale in their country, being highly esteemed. Several of these nuts were presented to the Academy of Sciences at its last meeting, and Mr. Stearns remarked that they came from a plant (of which there are several species) known to botanists as *Trapa*, belonging to the natural order *Onagraceae*.

The specimens shown were the fruit of the *Trapa bicornis* (or two-horned), the propriety of the name being manifest. The nut is sometimes called the water chestnut. The Chinese call them *Long* or *Links*. Another species, *trapa natans*, grows in middle and southern Europe, middle Asia, and northern and central Africa, and the fruit or nut has four spines. *Trapa Bispinosa* is found in Asia and parts of Africa, and it is said also to be cultivated in Japan. In some of these countries this latter species is an important staple in the way of food to the population. The nuts are held in high esteem by the Hindoos, and are sold in all the shops in India. Mr. Stearns thinks it is quite likely that some one of the species might thrive well in this country, and it would be well for some of our enterprising Californians to experiment with the Chinese species, which are easily obtainable in this city. The nut is well known among us from the peculiarity in shape. Some of the nut-growers in the southern part of the State might try the cultivation of these nuts at small expense, and see what can be made of them. There would be a good market for the nuts in this city and State among the Chinese population.



MECHANICS' FAIR PAVILION—1874.

The Industrial Fair Building.

The Ninth Industrial Fair of the Mechanics' Institute, of this city, was formally opened this week. The building in which the exhibition is held is a spacious one, as the accompanying engraving shows. The outside appearance, however, is not very elegant; but as the building is only a temporary structure, this was not to be expected. The Institute has a lease of the property for five years, with the privilege of retaining possession of it the sixth year, if desirable. The entrance for visitors is on Mission street, the building running from Mission to Market on Eighth street. A portion has been constructed from the front of the pavilion jutting out over the sidewalk, forming a covered way by which visitors can enter from cars or carriages, without exposure to the weather.

The contract for its construction was awarded on the 7th of May; and only about three months ago much of the lumber of which the Pavilion is constructed was growing in the forests of Oregon. Many of the timbers were cut to order, to suit the vast dimensions of the building. Some of these timbers measure 80 feet in length, 12x12 in., without a knot or flaw. The materials of which the structure is composed are as follows: 1,703,000 feet of lumber, exclusive of shingle, which were 1,398,000 in number; 190,000 bricks for foundation; 4,000 lbs. of iron bolts; 306 kegs of spikes and nails. The building contains 6,287,000 cubic feet, covering about 4½ acres of ground. The hight of the great exhibition building, from the floor to the arched ceiling, is about 90 feet. The first floor does not cover the whole area of the building, a wide space on the east side being appropriated to the display of horticulture.

The exhibition rooms of the upper floor or galleries extend the full length of the building; the west side being reserved for the art gallery. A promenade 16 feet wide extends around the front portion of the gallery, by which the entire circuit of the building can be made. This is kept exclusively for promenading, and offers the most favorable point for forming a general conception of the size of the building and of the grand display on the main floor below.

Visitors to the Pavilion for the first time are naturally amazed at its immense size. The building is 545 feet in length by 200 in width. To the average mind, the simple statement that when two people separate in the Pavilion they have as much chance of meeting again as if in the streets of a strange town, will convey a better conception than the figures. The arrangement is admirable. A regiment of troops could easily march and counter-march on the open area of either of the galleries.

Mr. J. A. Lytle writes from Cinnabar, Trinity county, that he is now extracting 100 pounds of quicksilver a day, by means of retorts, and has struck ore enough to run a 30-ton mill.

About 600 flasks of quicksilver have already been produced from the Cerro Benito mines at Panoche, San Benito county, notwithstanding the trouble had with the furnaces.

The miners' strike, at Nanaimo, British Columbia, has come to an end.

Quicksilver in Sonoma and Napa.

We condense the following description of the new quicksilver district from the Calistoga *Press:*

Approaching the Geyser and Healdsburg stage road from the west, the first mine is the Kentuck, now being worked under lease by the "Land and Contract Company," of San Francisco. There has been a large quantity of ore extracted, and several thousand dollars' worth retorted. The ore is taken from a great depth, and seems to be of a permanent character. Four long tunnels have been run, and reduction works on a large scale are soon to be erected, providing the tedious lawsuit which hangs over the title is settled.

Easterly from the Kentuck lie the Pocket Star and Wehfoot. These claims will not be worked to any extent until the aforementioned suit is settled.

Adjoining this easterly lies the Geyser mine, one of the oldest and best prospects in the district. It is owned by Edgar Mills and G. W. Gilbert, of Sacramento; Dr. Mott, of Marysville; Mr. Hossack, of Sonoma county; M. Friedburg, of San Francisco, and others.

Easterly and adjoining is the Lost Ledge, now being worked under lease, with the privilege of purchase, by the Oakland mining company, of San Francisco, Messrs. Reynolds, Roberts and Robertson being largely interested. The metal at this mine is the richest in the district, and is in place, and as the result of one week's extraction, with three very small retorts—holding but 200 pounds at a charge each—they have shipped this week a week's run of 25 flasks. This is a better result than has yet been obtained with reduction works of so limited a character. The lessees are erecting more retorts, and expect to more than double their present production. They have the ledge in their tunnel, and it carries cinnabar in richer quantities than any other mine in the county.

Almost parallel with the Lost Ledge is the Emma mine, owned by Messrs. Ball, Whitton and others. It shows good metal, but not much work has been done—the mine being involved in the lawsuit referred to before.

Southwesterly lies the Illinois mine, situated in the ravine, which seems to be a vast depository of very rich boulders and carrying metal of superior richness, some of them being of immense size. There is sufficient ore in sight to pay for the erection of a furnace several times over. This company have their headquarters at San Francisco. Verdeaal, Poulterer and others are largely interested.

To the eastward of the Lost Ledge is the Missouri mine, upon whose development a large sum of money has been expended. This mine is well supplied with reduction works, engine, crusher, etc., and has shipped a large amount of metal to market. It was worked during the snows and rains of winter, and to the developments made at this mine, is the reputation of the district largely indebted This mine has employed between 30 and 40 men, but the same tedious lawsuit affects its progress. The retorts at present are paying double the expenses of the mine, and the prospects for the future are promising. The mine is under the superintendency of Messrs. Comfort and Winters, of Calistoga, and is owned by Messrs. Stuart, Elder, Bowen, Kellogg, Litten and others.

Adjoining the Missouri is the Peerless, owned by Frank Adams, of Boston, and W. P. Litten, of Calistoga. A tunnel has been started to tap the ledge at a great depth, but the owners propose awaiting developments on its neighbor, the Missouri.

Following the trail passing the Peerless we come to the Rattlesnake. This is what is known as a "native" quicksilver mine. The metal is not in the form usually termed cinnabar, but is found adhering to the walls of the tunnels and shafts, and forms in little pools in the dirt or earth at the bottom of the tunnels. It presents the same appearance as though one had carried the metal into the tunnels and scattered it broadcast on the sides and roof. Mr. De Noon is superintendent. He has built more roads and made more improvements since last winter than all the other mines combined. He has the brick burned and is commencing the erection of a Luckhardt and Riotte furnace, which will have a capacity of 30 tons. This mine is in splendid condition. It has hundreds of tons of "sdohes" ready for the furnace, and is sure to prove remunerative to its owners, Parrott, Lightner, Burling and others, of San Francisco.

The Thompson mine, owned by Thompson Brothers, Pine Flat, is known to be rich, but little work has been done on it. The Sonoma is owned by General Dodge and others, of San Francisco, it having been purchased from Thompson Brothers some six months since for a good round sum. A large furnace has been erected and the shipments of quicksilver will average about 40 flasks a month at present. As soon as the ledge is tapped, if it is as rich as its surface covering would indicate, the result will be five times as great with the same works.

The next claim of importance is the Annie Belcher, superintended by Matt D. Carr. This claim is very promising, and shows very fine metals. Mr. Carr has displayed great energy in building roads to his mine, and in the general development of the district.

The Central is owned by Stuart, Pike & Litten, has a fine prospect, but not fully developed. Work is being pushed forward rapidly. A fine body of timber and plenty of water are included in the location.

Now the belt seems to divide, one portion running in an easterly direction, bringing to notice the American, owned by Wright and others, and the Great Western, the most promising mine on the coast, producing from $40,000 to $50,000 per month, which amount the superintendent soon expects to increase to $75,000. Shares of stock in this mine are held at $25 each, making the market value of the mine $1,250,000.

Taking the other direction, from Pine Flat southerly, we follow the other arm of the belt until we arrive at the Oak Grove, owned in part and worked by Nathaniel Morrison, lately from the East. They have cinnabar in the ledge.

The next claim attracting attention is the Yosemite, owned and worked by Everett E. Stacy, W. S. Burnham and others. The owners are sparing neither expense nor labor to follow the inducements which present themselves in their tunnels.

The Little Beauty, owned by James F. Stuart, of San Francisco, and the Norton claim, adjoining it, are both in good position, but not opened sufficiently to rank as mines.

Next we enter the lines of the Knight's Valley ranch, owned by San Francisco parties. This is a Spanish grant, patented, and the titles to the mines thereon are beyond any dispute. Just inside the borders of the grant we find the Ida Clayton, which is but four miles from the Great Western, the ledge running in that direction. Some twenty men are at work. Two hundred and fifty tons of ore are ready for the furnace. The ore is known as "black ore," and is very rich. The mine is fully established, and Mr. Cross, of long experience in the Redington mine, is the Superintendent.

The Yellow Jacket is owned by William A. Stuart and others, and has been prospected for a long while, and large quantities of very rich dirt await transportation to the furnace, now in course of erection. The dirt is being made into adobes preparatory to being burned in the furnace. Careful estimates and assays show the adobes to average $40 per ton. The quantity of ore obtainable cannot be estimated, as its boundaries have not been reached. The superintendent reports enough adobes to run the furnace all winter. The furnace for the extraction of the metal from the ores of the Ida Clayton and Yellow Jacket mines is nearly completed. It is of the pattern known as the "Knox & Osborn," such as is used at the Redington, Phenix, Manhattan and other mines. Wood and water are in abundance near the furnace, it being situated upon the banks of the beautiful stream lying between the two mines, which crosses the grant. The furnace will be in operation in about three weeks. These two mines employ nearly 100 men at present building roads, making brick and mining. Beyond this mine, the Yellow Jacket, no metal is found on the same lead, until the Vallejo mine, the St. John, is reached—a long distance of unprospected country. One can ride horseback along the belt we have described, commencing with the Yellow Jacket and ending with the Kentuck, and the peculiar color and formation of the ledge matter attracts attention the entire distance.

MINT ITEMS.—Under instructions from the Department at Washington, to bring the expenses for wages of workmen and adjusters at the United States Branch Mint in this city within the appropriation of Congress for that purpose, a number of employés were discharged on the 11th inst. By the old rulings of the department the employés of the mint were allowed extra pay for work performed after the expiration of the official day of eight hours. Work thus performed, during the imperative demand for trade-dollars, exhausted the appropriation for the late fiscal year in April, instead of June, and necessitated the passage by Congress of a deficiency bill for $60,000. The appropriation by Congress for the present fiscal year, amounting to $140,000, is $40,000 in excess of the appropriation for the year 1873-74, and will doubtless suffice to satisfy all demands for wages. The mint building, at the corner of Fifth and Mission streets, is steadily progressing toward completion, and will be ready for occupancy in a few months. It is a large and imposing structure, covering a superficial area of 225x160 feet, and contains a mass of superior machinery perfectly bewildering to the uninitiated spectator. The coining machinery commands the admiration of all mechanics who have been permitted to pay it a visit of inspection. The room it occupies is about 30 feet square, and located in the southeast corner of the building. The principal die weighs about 15 tons, and is the largest ever made in the United States, and the only one ever made of the pattern. It will be used for coining $20-pieces and the trade-dollar. The other two new dies will be used for touching up the $10 pieces, and for one-half and quarter dollars, while the two dies now in use at the mint will be brought over for the dimes and half-dimes.

A NEW Pioneers' society is being organized in Virginia city. All men who were residents of the Territory of Nevada prior to January 1st, 1863, are eligible to membership. The names of nearly 200 members have already been enrolled, and a meeting for permanent organization and election of officers will soon be held.

A RICH strike was last week made in the Exchequer mine, Alpine county. Some of the ore assayed as high as $1,000 per ton.

A COMPANY from El Dorado is fluming the North fork of the Yuba river, at New York Flat.

The Sierra Nevada Hoisting Works.

We had the pleasure, yesterday afternoon, says the *Independent*, of being present at the starting up of the new and powerful hoisting works at the Sierra Nevada mine. The new shaft is in three compartments—two hoisting shafts 5x4½ feet, and a pumping shaft, 6x5 feet in the clear; is 1,500 feet northeasterly from the old works, 1,000 feet east of a north and south line from the old works, and is further east than the shafts of any of the principal mines on the Comstock. John Lambert, the superintendent of the Sierra Nevada mine, conceived the idea of sinking this shaft, and suggested the architecture and construction of the new works. I. F. Thompson, the well-known architect, drew the plans, and W. I. Salkeld, who is both architect and practical builder, constructed the buildings, gallows frame, tanks, etc. William M. Candler, one of the most skillful machinists and engineers on the Comstock, or the coast, superintended the placing of the machinery. Charles M. Bonnemort, for some years foreman of the Savage mine, is foreman of the new mine, and struck the first pick in the new shaft. The shaft is now 425 feet deep, and contains 225 feet of water, which is being hoisted up to and run out through a drain tunnel, which intersects the shaft 155 feet below the surface.

The Main Building

Over the shaft and hoisting works is a most substantial structure, 105x40 feet; carpenter shop, 60x35 feet; boiler room, 52x40 feet, and blacksmith shop, 40x30 feet in size—all connected and bracing each other against the strong winds which sweep across the elevated plateau upon which they are situated, with terrible force.

The New Machinery

Consists of eight 50-inch boilers (in two independent sets); two slide-valve engines, manufactured by H. J. Booth & Co., one of 22-inch cylinder and 48-inch stroke, and the other of 20-inch cylinder and 36-inch stroke; a 14-ton fly-wheel to the pump engine, and a reel to same to lower or hoist pipe, etc., in the pump shaft; one hoisting reel with 2,000 feet and one with 1,500 feet of English wire cable; a donkey engine to be used for fire or for forcing water into the boilers; a 10-inch pump which may be worked at 5, 6, 7 or 8-feet stroke; a cast-iron heater (under the floor) 15 feet long, 26 inches wide and 16 inches deep, containing 500 feet of gas-pipe, through which water flows of its own volition, with a pressure of 132 pounds. to the square inch. Both engines exhaust into this heater, and the water, falling 285 feet from the tank on the hill above, and passing through 500 feet of pipe in this "steam chest," rushes into the boilers boiling, without the aid of a pump.

Fire

Would have no more chance to spread about the new shaft of the Sierra Nevada mine than it would upon the bed of the Mississippi. A 7-inch pipe conducts the water from the two large tanks 285 feet above, on the side of Cedar hill, and reaching the yard a few steps west of the hoisting works, the water is distributed about the premises by means of three 4-inch and several smaller pipes. The works stand in the center of a triangle of hydrants fed by these 4-inch pipes, and as a means of extinguishing fire either one of these hydrants is more than a match for all the steam fire engines in the city. In fact, when a full head is turned on, the hose will throw three or four of the heaviest men about as though they were feathers. Then there are four hydrants and a donkey engine inside the building. A water tank 18 ft. long, 10 ft. wide and 8 ft. deep has been constructed near the boilers, and this will be kept filled with water for use in the boilers in case anything should happen to cut off the regular supply.

Appurtenances.

The gallows frame over the shaft is one of the most substantial and ingeniously constructed ones on the lode, and was built by Mr. Salkeld.

Another very ingenious piece of work is a new kind of safety cage, constructed on the spot by Dan. Kelly, head blacksmith for the new works. The clamps (cast-iron wheels with sharp cogs) are thrown out by strong steel springs, constructed on the same principle of those in a gun-lock, instead of the old wire spring or wrapper.

Two dial plates, each six feet in diameter, are to be placed directly in front of the engineer and brakemen, and between them and the pulleys on the gallows frame, to indicate at all times the exact position of the cages in the shafts. These have not yet been put in place, but all the machinery for attaching them to the shafts of the reels is on hand.

The main building will be ceiled over the machinery, and is surmounted by an observatory or ventilator, consisting of a series of glass windows, so that the dust and snow can be kept out by closing the windward side, and at the same time the building can be ventilated by opening the windows on the opposite side.

All the machinery and the building itself is so arranged that two additional shafts may be sunk on the south side of the present one without interfering with the work now going on.

THE mill at Eagan will soon be started on ores from the mines of the San José Co., and other custom rock. General Rosecrans, the President of the company, has made many important improvements and changes in the whole machinery of the institution, and a sure guarantee is given of a successful run.

The Black Hills.

A *Tribune* correspondent with the Black Hills expedition writes from within two miles of the south fork of Cheyenne river, August 3d, giving the following summary of Custer's official report to date from July 16th:

Starting from Prospect valley, Dakota, the expedition moved in a southwesterly direction until it reached the valley of the Little Missouri, up which we moved 200 miles. The valley is almost destitute of grass. From the Little Missouri to the valley of Belle Fourche the country was generally barren and uninviting. Belle Fourche was reached on the 18th of July, and good grass, water and wood were abundant. From this point, just west of the line separating Dakota from Wyoming, was begun a skirmish through the outlying ranges of hills. The country is a very superior one, covered with excellent grass and having an abundance of timber, principally pine, oak and poplar. On the 22d we halted and encamped within forty miles of a prominent peak in Wyoming, called "Inejan Years," 6,600 feet high, which peak we ascended, lying over here one day. The expedition then turned due east, and attempted a passage of the Black Hills. After a short march we came into the most beautiful valley. "Its equal," said General Custer, "I have never seen." Such too, was the testimony of all those who beheld the panorama spread out before us. Every step of our march that day was amidst flowers of the most exquisite color and perfume, some belonging to new or unclassified species. The water in the stream stood at 44 degrees. This beautiful vale was christened "Floral valley." We followed this valley to the top of the western ridge of the Black Hills, winding our way through a little park of great natural beauty. On the 30th we camped within four miles of the western base of Harney's Peak, which the next day General Custer ascended with engineers and a small escort. The peak was the highest point in the Black Hills. This morning two companies under Colonel Hart were dispatched to extend our explorations in a southerly direction to the south Fork of the Cheyenne. To-morrow, General Custer, with five companies of cavalry, will endeavor to reach the same stream in a southwesterly direction from Harney's Peak.

The correspondent adds: In no portion of the United States, not excepting the famous blue-grass region of Kentucky, have I ever found grazing superior to that which grows wild in these hitherto unknown regions. I know of no portion of our country where nature has done so much to prepare homes for husbandmen, and left so little for them to do, as here. Everything indicates an abundance of moisture within the space occupied by the Black Hills. Gold has been found in several places, and it is the opinion of those who are giving attention to the subject, that it will be discovered in paying quantities. I have upon my table forty or fifty particles of pure gold, in size about that of a small pin-head. Most of it was obtained to-day from a single pan of earth; but as we have not remained longer at any camp than one day, it will be readily understood that there is no opportunity to make satisfactory examinations in regard to deposits or valuable minerals until further investigations are had. Regarding the richness of the deposits of gold, no opinion should be formed. Veins of what the geologists call gold-bearing quartz crop out on every hillside. All existing geological maps of this region have been found incorrect. The northward march begins in a few days, and General Custer expects to reach Fort Lincoln by the 31st of August. Small parties of Indians met by the expedition generally fled. "Sioux," one of their chiefs, was captured. He recently returned from a hostile camp on Powder river, and says the Indians lost ten killed in the fight with the Bozeman exploring party.

A VALUABLE COAL MINE.—George Emmet, proprietor of the Gold Hill Foundry, yesterday ran his large establishment with coal from the Black Diamond coal mine, situated eleven miles from this city, or seventeen miles distant by way of Dayton. The foundry will also be run to-day on coal from this mine. The coal makes steam more rapidly than Rooky Mountain coal or wood. Compared with the Scotch and New Zealand article the Nevada coal looks to be superior. The coal seam of the Black Diamond was only one inch in thickness at the surface, but at a depth of 150 feet, by incline, or, say 60 feet vertically, the vein has widened out to fully three feet. The walls of the vein are smooth, hard and strongly marked. At present four men are engaged in sinking on the incline, and steam hoisting works are to be put up immediately. There is an excellent natural wagon road from Dayton to the mine, and the Black Diamond coal mine bids fair to be of greater value than the Belcher or Crown Point silver mines.—*Virginia Independent.*

MINING AT SAN JUAN.—The hydraulic mining at San Juan is being continued without cessation. Water is to be had in abundance, so they are enabled to run full handed. At Montezuma hill the mine has ceased work for a short time. We were unable to learn the cause, but understand that operations will be resumed at an early day. The American mine, at Sebastopol, is running its tunnel with rapidity, averaging about 50 feet a month. Washing continues through the upper tunnel, so that while the lower one is being driven at an immense cost, the upper is producing the specie—a very happy combination. The other mines there are prosecuting operations as usual. —*Grass Valley Union.*

SCIENTIFIC PROGRESS.

Vivisection.

The question of the propriety of vivisection has ever and anon cropped up for the last two centuries, and learned and unlearned persons have not been found unwanting to condemn the practice. Amongst the latter the term vivisection has been taken to mean the dissecting of animals alive, with no other motive than curiosity or a malignant desire to be cruel to animals.

This arises from the utter and entire ignorance, on the part of the great mass of the republic, of the scope and nature of physiology or the laws of life. If the elements of this noble and useful science were taught in our schools as they should be, the unmeaning outcry against the practice of "dissecting live animals," as it is called, would not be heard. People would then know that the wonderful knowledge now possessed by man of the functions of his body has mainly been acquired by experiments on living animals, and that by the practice of vivisection is not meant the dissection of living animals, but the performance of experiments by which the nature of the functions of living beings may be ascertained.

The question still arises whether experiments that resulted in discoveries should be repeated for the instruction of a class, or be regarded as final? Many physiologists think that the renewal of the experiments in the form of a demonstration before a class is not necessary. This position, however, can not be maintained, if regard is had to the good of mankind. He would be a poor chemist who did not re-perform the experiments of those who had gone before him; and the natural philosopher could not make progress in his science if forbidden to repeat the observations of his predecessors. It is not only necessary to make good practitioners of medicine and surgery that these experiments should be repeated, but it is necessary for the advancement of the science of physiology.

Of course all these experiments should be performed with the greatest attention to diminishing pain to the utmost extent. Happily, by the use of anæsthetics, we can now do this so that an animal does not suffer more than it would in passing out of existence in any other way.—*Nature.*

During the change of water into steam, a remarkable phenomenon has been discovered, being nothing less than the apparent disappearance of large amounts of heat, which appear to be consumed in order to overcome the cohesion of the water particles, and change it into a repulsion, which is the cause of the expansive elasticity of the steam, and results in the useful application of its pressure. The heat which thus disappears is called the latent heat of steam, and it reappears again as soon as the gaseous steam returns to the condition of liquid water. The amount of this heat is about 1,000 units; that means, in order to convert 1 pound of water of 212° into steam of the same temperature, 1,000 units of heat will disappear, or as much heat as would suffice to heat 1,000 pounds of water 1°, 100 pounds 10°, or 10 pounds 100°; consequently as 1 pound of anthracite coal gives 14,220 units of heat, it will convert 14.2 pounds of water, and bituminous coal 13.5 pounds of water into steam. The amount of expansion which the water undergoes during this change is an increase in bulk of about 1,700 times; and as 1 cubic foot contains 1,728 cubic inches, the usual statement that every cubic inch of water becomes a cubic foot of steam is nearly correct for practical purposes.—*Manufacturer and Builder.*

Heat-Conducting Power of Rocks.—Prof. Herschel and Mr. Lebour have been experimenting on this subject. Twenty-eight specimens of rocks were reduced to uniform circles of five inches diameter and one-half inch thickness, carefully gauged. Out of six specimens that had been tried, slate plates, cut parallel to the plane of cleavage, transmitted the heat faster than any of the others. Where the flow of heat had become uniform, the water was raised 1° Fah. in 32 seconds. With marble, sandstone, granite and serpentine, about 39 seconds were required to raise it by the same amount. The greatest resistance to the passage of heat was offered by two specimens of shale, gray and black, from the coal measures in the neighborhood of Newcastle, which occupied 48 or 50 seconds in raising the water 1°, or half as long again as the time taken by the plate of slate.

The Chronograph.—This is a clock which carries a large cylinder upon which is wound a band of paper. A pen is arranged so that it traces a continuous line upon this paper, in the form of the thread of a screw; but every second this pen is pulled a little to one side by an electro-magnet, connected with the observatory clock, and thus keeps a perfect record of the time. But this electro-magnet is also connected with a key near the observer, by depressing which he can also draw the pen to one side. At the instant he sees a star cross the spider-line in his telescope, he presses the key, the pen is drawn aside, and thus the observation is recorded. He has only to note the time within a minute, and then on examining the paper the exact second is found, and from this determinations of longitude or of time can be made.

By the aid of reservoirs containing mixtures of oxygen and nitrogen, in which the former gas was in the proportions of 40 and 70 per cent. of the whole, MM. Croce-Spinelli and Sivel succeeded in reaching by means of a balloon an altitude of nearly five miles without inconvenience. The inhalation of the strongly oxygenated mixture immediately relieved all symptoms indicating that the aeronauts had passed into an atmosphere too attenuated for comfortable respiration. M. Lissajous has just communicated to one of the French societies a short account of the observations made by MM. Croce-Spinelli and Sivel in their aerial voyage. The temperature decreased regularly, except during their passage through the clouds. Above the clouds the thermometer marked 9.6 deg. Fah. At an elevation of 4,500 metres (nearly three miles) crystals were seen sparkling in the sun below the car of the balloon. At the upper limit of the ascent the rays of the spectrum indicating aqueous vapor disappeared, showing that this vapor does not belong to the surface of the sun. M. Croce-Spinelli found that the dark color of the sky observed at great elevations is due to an illusion produced by fatigue, as the blue color of the sky reappeared immediately after he inhaled the oxygenated mixture.

The Aerophore.—Some interesting experiments were lately made at one of the large English collieries with an apparatus called the aerophore. This invention, it is claimed, will enable a miner to penetrate at once, and to a great distance, into a pit filled with choke-damp, to remain there several hours, to carry his lamp with him without danger, and without depriving him of the free use of his arms. The principle of this invention is to support combustion within the lamp, not by means of the surrounding air, but through the agency of pure air passing through a regulator carried by the miner on his back. A small hut was filled with noxious gases, with a mixture perhaps best described as one of sulphurous and carbonic acid. A cat was placed in the hut, and a man, armed with his apparatus, entered and began the construction of a box. In 22 minutes he returned with his box completed, and certainly none the worse for his venture, and with a respectably constructed box, which he said had been marred by the fact that the excessive amount of sulphur had spoilt his hammer. The cat was brought out immediately afterward. It was then living, but death quickly followed. Other experiments were made, all of which were pronounced entirely satisfactory.

At a meeting of the British Academy, Dr. Gladstone called attention to some photographs of fluorescent substances. Fluorescent substances, such as bisulphate of quinine or uranium glass, have the power of altering the refrangibility of the violet or chemical rays of light; hence, although paper painted over with bisulphate of quinine will look nearly white, it will appear in a photograph as if it were nearly black. Dr. Gladstone exhibited some photographs of ornamental design traced on white paper with bisulphate of quinine; although the designs were nearly invisible to the eye, in the photographs they were boldly visible. A colorless solution of bisulphate of quinine was placed in one glass, and some ink in another glass; when both glasses were photographed, they came out equally black. Dr. Gladstone said that once, at the seaside, he painted a pattern with bisulphate of quinine upon paper, and took the paper to a photographer to be photographed; he objected, because there was nothing on the paper, but on trying the experiment he found out his error. It was stated that some kinds of varnish possess a similar power of affecting the refrangibility of light.

When a ray of sunlight crosses a shaded room, an immense number of fine particles will be noted, apparently in suspension therein. M. Tissandier has recently made some investigations into the quantity of this dust contained in 35.3 cubic feet of air, by causing that quantity of air to pass through a tube packed with gun cotton, which filtered out the particles. He afterwards dissolved the gun cotton in ether, and thus was enabled to obtain the particles in a separated condition. After a heavy rain, M. Tissandier has collected .09 grains of dust in the above mentioned quantity of air, but during dry weather this proportion rose to .3 of a grain. With regard to the nature of the material, he found that about one-third was organic, another silicious, and the rest composed of various substances and sulphate and oxide of iron.

Recovery of Silver from Cyanide Baths.—Dr. Grieger states that there are many methods of accomplishing this object, but none have been so easily carried out or have obtained enough of the silver as to be satisfactory. The process recently described by Ney, in which the silver was precipitated as a chloride by the addition of muriatic acid, had both these faults. The silver was not all precipitated, the subsequent treatment of the precipitate was not a simple one; and beside, the operation was attended with a strong evolution of prussic acid, which is extremely unpleasant to many persons, not to say dangerous to life. Dr. Grieger reduces the cyanide by green vitrol, and then precipitates the silver by grape sugar.

Safranin.—If mixed with strong sulphuric acid, this dye-stuff develops a fine blue tint, becoming emerald green by addition of a little water. By suitable additions of water and acid, nearly all the prismatic colors can be produced. —*Scientific Amer.*

MECHANICAL PROGRESS.

Coining.

The operations conducted at the private mint at Birmingham, Eng., as we learn from an interesting report in *Iron*, are as follows: The raw material consists of immense quantities of copper in ingots for bronze coinage, and "cakes" of the same metal for copper coinage. The metal used for the bronze coins is composed of 95 parts of copper, four parts of tin, and one part of spelter or zinc. The metal is first taken to the casting shop, and there melted and run into molds of the required length. The processes of casting being almost the same for all purposes, there is no need of giving a minute or detailed description of the operation.

The strips of metal when cast are taken to the rolling mills. The slabs of metal are first passed through the heavy revolving cylinders, and the pressure is so great to which they are subjected, that they are rolled into much longer, and, of course, thinner strips. They are next submitted to the ordeal of fire, and annealed. They are submitted to this process of rolling until the requisite thickness, or rather thinness, is obtained. A slab, which is at first only some 15 inches long, is rolled out to six feet in length. It is then placed once more in the annealing oven, "pickled" by being passed through acid, then cleaned and scoured. Each slip has to be gauged with the utmost nicety after it has undergone these processes, to ascertain whether it is of equal thickness throughout.

After being approved, the strips are taken to the cutting-out room, where they are passed under a press, and bits of circular metal of the size required are cut out and drop into receptacles beneath. These bits of plain metal are appropriately called "blanks," and are cut with almost incredible rapidity. One press produces 750 a minute, and in the mint the number of presses employed are capable of producing over 3,000,000 of blanks a day. After being cut, the blanks are tested by being passed through a machine, which is so nicely adjusted that any irregularity or imperfection is detected, and the tares are separated from the wheat. The blanks which pass successfully through the trial have also to be annealed. For this purpose they are "put into small iron pots, the lids of which are carefully adjusted, and the junctions stopped with clay, and placed in the oven, where they remain generally about three-quarters of an hour. They are then allowed to cool gradually, passed through a solution of acid, and in their wet condition are placed in a revolving wooden drum, together with quantity of rough saw-dust. The motion of the drum causes the saw-dust to escape through small apertures provided for the purpose, and by the time the blanks are dry—usually in 20 minutes—all discolorations have been removed, and a uniform bright color attained. They are then ready to receive the finishing stroke—the impression which shall cause them to be universally recognized as tokens of value." After the blanks have been cut out of the strips of metal the "scrap" is recast, and the material re-used.

Two dies are required for each coin; the one for the obverse, the other for the reverse. These are engraved on the best steel, but the original dies are not used in making the impressions on the coins. For this purpose a punch is made, and from this punch the moulds by which the coins are made are taken by pressure. The pressure required for this purpose is at least 40 tons. The moulds are made on the surface of pieces of steel, the diameter of which is a little larger than the coin to be made. So great is the pressure of the striking hammer, that the slightest flaw in the steel used is fatal to the working die, for it comes from under the machine exhibiting a large rent wherever the flaw may be. The importance of this power of multiplying dies will at once be manifest. Sometimes they are destroyed in a few minutes, lasting, we learned, on an average not more than two days; but the original die, which represents a fortnight's skilled work, remains perfect, for the production of other punches to be used in making working dies.

The coining is a very simple process, and is now rendered almost noiseless by improved machinery. In each press is a movable steel slide, in the center of which is a circular hole the size of the die, called a collar. The blanks to be impressed are placed in a long brass tube, called a feeder or hopper. From this feeder one blank drops into the collar with each movement of the slide. It is between the top and bottom, and as the blow is struck, both sides are impressed at once.

Lubricating Packing.—In manufacturing this improved packing the inventor employs a mandril of any required diameter. Upon this mandril he winds a cord of twisted cotton, which has previously been saturated or covered with a solution of a compound of india-rubber. After the cord has thus been coiled upon the mandril, he coils or winds over the same cotton, yarn, or other suitable twisted or untwisted fiber, which is also saturated or covered with the aforesaid india-rubber solution; the packing thus made may be cut into portions or sections of any required length.

Iron fortifications are being erected at large expense in Germany and Great Britain.

The Invention of Screw Propulsion.

Much discussion has recently been agitated as to the conflicting claims of various inventors and nations to the honor of having first introduced the screw propeller. The English claim that Sir Francis Pettit Smith was the real inventor, while in this country it has been held that Ericsson was first to put the idea in successful practice. The two were independently at work, and to each belongs the credit. It may even, says Bourne, be probable that the exertions of either would have sufficed to introduce the screw into practical operation, but their simultaneous prosecution of the same object was not nevertheless a waste of power. The progress of each, therefore, was stimulated by that of the other, and their united force acted more powerfully upon the public, and procured for the screw a readier and wider introduction than could otherwise have been expected. Neither invented the screw, but both revived it.

The *Scientific American* says: It is certain that for many years previous to the date of either Smith's or Ericsson's patents (1836), experiments had been made proving that vessels could be propelled through the water by means of a screw. But the inventors were either deficient in persistency of effort, or they found that, as is very often the case, the times were not ripe for the introduction of so radical an innovation. It is, therefore, a fact that, when Smith and Ericsson took up the subject, no vessel of the kind was in actual employment; and so far as past experiments extended, the simple fact of their abandonment, or rather non-continuation, held out a prospect for future inventors far from encouraging.

Ericsson's patent was obtained about a month and a half subsequently to that of Smith, but while the first trial of Smith's boat was made in May, 1836, immediately on the granting of protection, Ericsson's experiment did not take place until April 30th, 1837. The Ogden, built by Ericsson in the latter year, was undoubtedly successful, but Smith's first vessel was equally so, for she made a voyage of 400 miles, and averaged a speed of 8 knots per hour. Hence, while both ships proved the value of the invention, Smith's was undoubtedly first in so doing, in point of time.

English Railway Signals.—The plan of Messrs. Smaillie and Vance consists of a combination of self-acting interlocking signals. Spring-catch levers are fixed on the inner side of and flush with the rails at given points of the line; these levers are connected with self-acting interlocking arm signals in the case of ordinary distance signal stations, or with an electric gong at junctions of shunting sidings. When a train passes one of these levers, the flange of the wheels of the engine and carriages presses the lever down, setting the signal immediately behind the train at danger. The protection thus afforded the train in motion is continued till the next signal station is reached, when an ingenious arrangement of levers and cranks simultaneously sets the new signal at danger and the last one free. The train being thus protected from the rear the telegraph comes into play to obviate danger from the front. At a distance, say, of two miles from a junction, a catch spring-lever, also laid with the rails, is connected with a powerful galvanic battery from which a wire is laid to the junction, and there attached to a gong. On a train passing over the catch lever the electric current is completed and the gong is rung, thus warning the officials at the junction that a train is approaching. The gong continues to ring until the train has passed the junction, where another lever is fixed to the rails, and only on acting upon this lever is the electric circuit broken, when the gong ceases to ring. It would seem from this that a device which has long been in use on Eastern roads is just coming into notice abroad.

Simple Leveling Instrument.—M. Goulier proposes for the above a pendulum hung by a double point, which carries, rigidly attached, a collimator formed of a small tube hermetically closed at one extremity by a piece of ground glass. At the other end is a converging lens. At the principal focus is a diaphragm pierced with a hole 0.05 inch in diameter, across which is a thread of black cotton. By suitable construction, the pendulum being at rest, the plane passing through the thread and the optical center of the lens is horizontal. On looking through the lens, the observer sees the thread as a horizontal line, which marks on the field the intersection of horizontal plane through the instrument. By placing the eye in proper position, the thread and exterior objects may be seen at the same time, and the mark on a leveling rod may be adjusted to coincide with the thread, so obtaining a level.

Instead of using hinged doors as heretofore, English inventors propose to apply to strong rooms or safes sliding doors of great strength, and to move these doors by means of hydraulic pressure, which pressure may be maintained until access is required by an accredited person to the interior of the same. The doors they propose to make of such size and thickness that the mechanical appliances to which burglars resort will be powerless to move such masses.

Great saving of time and labor in casting metals is effected by using an endless chain of moulds, which are filled, chilled and emptied as they revolve in an endless chain, and then by the same means brought back again under the flow, the operation being continued without interruption.

Mining Stocks.

The mining share market is e little better this week tbsn last, and there have been a few spasmodic attempts at a rise. Stocks look a little more buoyaut, however, and if a good strike occnrs on any of the Comstocks, it will probably raise np the whole lot. The *Enterprise* of Saturday, in its weekly review of the mines on the Comstock lode, contains the annexed: The indications and developments along the Comstock are of a very favorable and cheering character. The lower levels of our leading ore-producing mines are allowed to be all right, and less doubt is expressed in regard to the value and permanence. The mines that have been so long water-logged, as the Sierra Nevada, Dayton, Utah, and some others, are now fast being drained, and in some of them we may expect to hear of good developments being made at no distant day. Those that have been so long engaged in drifting along the walls of the vein in their mines cannot continue thus to drift forever. There must one of these days come a time for cross-cutting and a general showing up. When this shall be done it is shrewdly suspected that we shall hear of much good ore being brought to light in not a few mines of which little is now heard, except that drifts are now being pushed in this or that direction in their various levels. That our people are expecting something to happen before long is shown in their general alertness when the slightest rise occurs, and in the activity with which they search for, and the avidity with which they seize upon any information which is in any way obtainable in regard to mines of which they have a favorable opinion. From the Utah on the north to the farthest chain within the Comstock range on the south, each claim is scrutinized, and its condition and prospects commented upon. In the work of prospecting there is no relaxation, and on claims along the line, both great and small, astonishing activity prevails.

The mining dividends for the month of August were four in number, and aggregated $657,000. The assessments delinquent were 29 in number, and aggregated $497,400. These were as follows: Andes, 50 cts. per share, $25,000; Adams Hill, 15 cts., $7,500; Belmont, $1, $50,000; Best & Belcher, 50 cts., $11,200; Buckeye, 50 cts., $8,000; Chief East Exten., 10 cts., $3,600; Caledonia, $3, $60,000; Condor, 25 cts., $6,250; Emma Hill Cons., 10 cts., $5,000; Europa, 25 cts., $5,000; Eureka M. and Smelting, 25 cts., $7,500; Golden Chariot, $3, $90,000; Hartford, 20 cts., $6,000; Heckendorn, 25 cts., $7,500; Ida Ellmore, $1, $30,000; Indus Gold, 10 cts., $3,000; Lady Washington, 50 cts., $18,000; Mabogany, $2., $50,000; Mammoth, 10 cts., $3,600; Mint, 10 cts., $5,000; Oneida, 75 cts, $7,500; Pioneer Cons., 10 cts., $5,000; Rye Patch Cons., 25 cts., $7,500; Rock Island, $1, $24,000; Stanislaus River, 15 cts., $4,500; St. Patrick, 50 cts., $10,000; Wash. and Creole, $1, $30,000; Wonder, 10 cts., $3,000; Wyoming, 25 cts., $3,750.

The dividends and assessments for the first eight months of the year were as follows:

	—Assessments.— No.	Amount.	—Dividends.— No.	Amount.
January	23	$748,000	3	$327,500
February	11	266,700	4	832,500
March	25	748,250.	4	844,000
April	22	459,016	4	944,000
May	15	356,300	5	1,279,000
June	16	321,400	5	1,203,000
July	27	632,600	6	1,223,000
August	29	497,400	4	657,000
Totals	168	$4,029,666	35	$7,810,000
Same time in 1873	206	4,677,810	48	10,087,000

The assessment of the Raymond & Ely mine mentioned in our "Shareholders' Directory" is the first one levied in that well-known mine. The mine has paid 23 dividends of 13,075,000, equal to $102.50 per share. The first dividend was paid in March, 1871, at the rate of $1 per share. During the year 1872, there were eight consecutive monthly dividends of $7 per share. The last dividend of $3 per share was paid in September, 1873.

The Ophir case has been decided and the *Enterprise* furnishes the following summary: The Board of Trustees of the company consists of seven members. One of them resigned. The six remaining trustees voted to fill the vacancy. The vote resulted in a tie, whereupon the President of the Board, who was one of the trustees, claimed and exercised the right, under the by-laws of the company, to a casting vote. This gave him two votes, and a trustee was elected. The trustees then proceeded to elect a new Superintendent. Against this three of the trustees protested, on the ground that they did not consider the election valid. The decision of the court is that the President, no matter what may be inferred from the by-laws of the company, had no right to two votes, as such a privilege is not authorized by law. Hence, as the new trustee was not legally elected by the casting vote of the President, the election of a Superintendent, secured through the vote of the new trustee, was also illegal. The decision holds that the new trustee was not even a trustee *de facto*, inasmuch as he was not recognized as such by a majority of the Board.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

CALIFORNIA COCOANUT PULVERIZING CO.—August 10. Object: To carry on the business of pulverizing cocoanut and manufacturing the same for commercial and domestic purposes; also to extract the oil for toilet and other purposes. Directors: A. P. Ashbourne, Jesse Slaughter, Thomas L. Williams, C. H. Harris and Robt. Fletcher, of Sacramento; James Phillips and Wm. M. Smith, of San Francisco.

MARTIN WHITE M. Co.—Aug. 16. Location: Ward Mining District, Nye county, Nevada. Directors: Martin White, E. D. Sawyer, R. P. Clement, George F. Baker and Lyttleton Price. Capital stock, $10,000,000.

SUNRISE SILVER MINING CO.—Aug. 18. Trustees: J. S. Nieswander, H. C. Rollins, N. A. Bechdel, William M. Donnell and T. B. Wingard. Capital stock, $5,000,000.

ANNIE BELCHER QUICKSILVER M. Co.—Aug. 19. Location: Sonoma county. Directors: William Faulkner, Charles P. Faulkner, Matthew D. Carr, James Howarth and John Goldthrop. Capital stock, $3,000,000.

The following companies have filed certificates of incorporation in the office of the Secretary of State, at Sacramento:

ST. HELENA WATER CO.—Principal place of business, Napa City. Capital stock, $20,000, in shares of $40 each.

OCEANIC QUICKSILVER MINING CO.—Capital stock, $6,000,000, in shares of $100 each.

BLUE JACKET MINING CO.—Capital stock, $4,500,000, in shares of $100 each.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

Alpine *Chronicle*, August 8: Very rich ore was this week struck in the upper tunnel of the Exchequer mine. It is thought to be worth $1,000 to the ton. The mine gives promise of being the richest mine on this coast.

ALL READY.—The amalgamators and feeders for the Exchequer mill arrived on last night's stage, and everything being ready, active operations will commence on next Monday morning.

CALAVERAS COUNTY.

DEVELOPMENT OF THE IRON INTEREST.—Calaveras *Chronicle*, August 15: Wednesday last we visited the scene of operations of the Hepburn Iron Mining Company, near Doak's ranch, in this county. The work done so far is preliminary, more for the purpose of determining the size and exact location of the ledge than with a view to permanent development. The ore appears to be of a fair quality, and the showing is fully as good as could be expected from the labor performed. We understand it to be the intention of the company to push forward work as rapidly as possible, until the extent, permanency and richness of the deposit are definitely settled. A successful issue of the enterprise is most earnestly to be hoped for. The establishment of iron works would give employment to a large number of hands, necessitate the outlay of capital, and stimulate further development of the latent resources of the county.

GRAVEL MINES.—There is "no let up" to the gravel mines in this vicinity. The utmost activity prevails from one end of Tunnel ridge to the other, a distance of about six miles. There is still an abundance of water, and no indications of a failure of supply. We hope to be able to visit the different mines shortly, and give our readers a detailed account of operations.

EXTENDING FLUME.—Emerson, the Happy valley hydraulicist, is extending his flume, for the purpose of getting more "dump." And he will get it. By laying down a few more boxes he can "tail" into Buckeye gulch, leading to the Mokelumne, that will give him "dump" enough to hold half of the Sierras.

COLUSA COUNTY.

QUICKSILVER.—Colusa *Sun*, Aug. 15: The "Varuna," on Thursday, brought up the last of the castings for a furnace at the Abbott mine. Work will be commenced on the furnace next

Monday, and it will be completed in three weeks thereafter. The "Varuna" also brought up the fire-brick for the Buckeye furnace, and we suppose the castings will follow up immediately. Both these mines have ont a large lot of rich ore. The latter is, however, retorting and shipping about 1,300 pounds per week.

EL DORADO COUNTY.

SALE.—*Republican*, Aug. 15: J. H. Bradley, of this city, has finally disposed of a large interest in his mining property near Brownsville, and has the coin to finish opening and working it. The claim consists of 140 acres of gravel, with plenty of free water, and it is generally believed that an expenditure of $6,000 will put it in a good paying condition. Mr. Bradley considers the claim worth $100,000.

INYO COUNTY.

THE LIDA MILLING PROPERTY.—*Independent*, August 8: This property was this week formally, as it was previously in fact, sold to Gen. Page, the price paid being $10,000. A new boiler is being put in, which will require but a few days, when the mill will start up and things move again at Lida.

LAKE COUNTY.

AMERICAN QUICKSILVER MINE.—*Bee*, August 15: The American quicksilver mine is on Pine Mountain, 7 miles from Middleton, and 3 from Pine Flat. The company have started their new works, and have four bonches of retorts. They are crushing the work with a 10-stamp mill, grinding it as fine as powder, in accordance with a new process. The prospects are good. George Wright is Superintendent, and has 75 men employed.

GREAT WESTERN MINE.—The Gt. Western quicksilver mine has 125 men employed. This mine is extensive, and has an established reputation for richness. A new furnace of 40 tons capacity is about to be started.

LOS ANGELES COUNTY.

MINING EXCITEMENT.—*Express*, August 13: A quiet mining excitement is now going on here in relation to a very valuable ledge which has been opened here in the San Gabriel cañon by Dr. Winston and others. The ore is a soft, rotten quartz, and the ledge is monstrously large in some places. Capable parties in this city are taking a lively interest in this mine, and crushing machinery will probably soon be put up.

NAPA COUNTY.

FLAGSTAFF MINE.—Napa *Register*, Aug. 15: This mine, situated on the Geyser road, is rapidly developing into one of the most wonderfully rich mines in that region. Last week globules of quicksilver were found scattered so thickly in the loose dirt as to attract the immediate attention of the miners at work in the tunnel. A blast was put in immediately after this discovery, and when the smoke had cleared away, quicksilver was found pouring out of the rock in a stream as large as a straw. A dipper was held under the stream until half filled with the precious liquid. On further examination a pocket was also found near by, which contained something like a teacupful of quicksilver.

THE mines are looking well, and work is being pushed in every direction. The Kentuck is taking out splendid ore. The Lost Ledge is being rapidly developed. They have just completed the erection of a bench of three new retorts, and will have them in operation in a few days. Thirty-five men are employed at this mine, which is being worked by the Oakland Quicksilver Mining Co. They are taking out on an average three flasks a day.

AT the Missouri mine everything is running smoothly. They are turning out their usual six to eight flasks per week with their two small retorts. Hopkins, the original discoverer of the Missouri, is now engaged there prospecting, and within the past few days has struck a very rich chimney of ore about 500 feet east of where the mine is being worked.

AT the Rattlesnake they are putting up a Riotte & Luckhardt 20-ton furnace. The 150,000 adobes already made, and are still making them at the rate of 8,000 per day.

THE Sonoma is running on adobes. The last clean-up is 23 flasks in 16 days' run.

AT the Central the main tunnel is in 200 ft., with a good showing of ore for a distance of 30 ft.

CALISTOGA SILVER MINE.—*Bulletin*, Aug. 16: Another rich strike was made in the Calistoga silver mine on Saturday, and of a remarkable nature. Workmen engaged in stripping the out-croppings of the ledge exposed a wall of projecting quartz 6 ft. thick by 300 ft. long, that assays well. The mill, having been enlarged, will not be in running order for 10 or 15 days.

NEVADA COUNTY.

NEW YORK HILL MINE.—*Union*, Aug. 15: We saw at Delano's yesterday a nice dab of gold that had been cleaned up after a crushing of rock from the New York Hill mine. The gold was valued at $2,100 and came out of 38 loads of rock. The rock crushed was taken out of the tunnel and none of it was stoped out.

OMAHA MINE.—A new wheel is being put up so that the hoisting and pumping will be done separately. Water power is used. The rock in the present level is rich, being in the red ocher quartz, which always pays. A crushing is ready and awaits its turn at the mill.

MAGENTA.—Pay ore is coming out from different levels and accumulating on both sides of the works, and teams are hauling from one of these piles to mill. The fourth level of this promising mine is soon to be opened.

GOLD RUN MINE.—*Transcript*, Aug. 14: This mine is located on Gold Flat, about one mile from town. The ledge was formerly worked, and was very rich. It was then called the Mohawk. Last spring a party from San Francisco purchased the mine and erected hoisting works upon it. Since the erection of the works the company have been engaged in sinking a shaft and are still going down. The ledge is from six to 14 inches thick, and looks well. The prospects are flattering for the ledge to develop into a good paying mine.

BLUE TENT CONSOLIDATED GOLD MINING COMPANY.—The company above mentioned are engaged in building a ditch from a point on the South Yuba river, a little below where the South Yuba Canal Co.'s ditch commences, for the purpose of running water to their mine, situated at Blue Tent. They have 75 men employed on the works. They have completed about three miles of flume, which is of the most substantial character. The ditch will have a capacity of running about 700 inches of water. It is expected the work will be completed as far as Diamond creek this fall.

PLACER COUNTY.

IOWA HILL.—Placer *Argus*, Aug. 15: The Snicker Flat company has run a bed-rock tunnel into the main divide 500 ft., and have raised up, and are at present pushing for gravel. Nearly every square foot of mining ground is taken up within 10 miles of town. Speculators still continue to buy, feeling confident that they are making profitable investments.

GOLD RUN.—The Old Cedar and Sherman claims were sold to an English company, in Feb., 1872, and are now known as the Gold Run Hydraulic Mining company (limited) of London, England. After changing hands, the ground was worked one season, and netted the company a handsome profit. In May, 1872, they commenced sinking the shaft, and discontinued work on the 2d July for the want of water to run their "hurdy-gurdy" wheel, with 10 inches of water being used to do the hoisting. In April, 1874, work was resumed, and after many difficulties bed rock was reached at a depth of 181 feet. As nearly 200 feet has already been washed from this claim, the bottom of the shaft is not far from 400 feet below the original surface. There is yet 165 ft. of splendid hydraulic gravel, and then 16 ft. of blue cement, for milling. Two dollars and a half to the pan, from dirt not selected, was the prospect got; and though well satisfied before that the ground was rich, it has a tendency to stiffen up the whole mining community, as it proves this gravel deposit to be one of the richest and most extensive in the world. The stock of this company is principally held in London.

SAN LUIS OBISPO COUNTY.

OCEANIC.—*Tribune*, Aug. 15: A 60-foot drift has been run in the Oceanic quicksilver mine, showing from 5 to 28 per cent. ore throughout its length.

SAN MATEO COUNTY.

A COAL MINE DISCOVERED.—*Times*, Aug. 15: Quite an excitement has taken place in the vicinity of San Mateo and Half Moon bay owing to the discovery of a coal vein on Michael Cassey's farm, which adjoins Byrnes' on the road to Half Moon bay. A specimen of the croppings has been shown us and so far as we can judge San Mateo county is the possessor of a veritable coal mine. A large sample of it was taken to town yesterday, and we have been informed that experts pronounced it to be a fine specimen of coal.

SANTA CLARA COUNTY.

VENTURE.—*Signal*, Aug: Parties are leaving Los Angelos for the gold mines at the head of the Santa Clara river. The existence of gold in that locality has long been known, and the present excitement is caused by the digging of a ditch from Elizabeth lake, which will bring water on the plains.

SONOMA COUNTY.

QUICKSILVER ITEMS.—Russian River *Flag*, August 14: The owners of the quicksilver mine southwest of Healdsburg, heretofore known as the "Great Western," have changed its name to "Mount Jackson," to avoid the confounding of this with the "Great Western" of Lake Co. Williams and others, claimants to the Grant Eastern mine under alleged locations of ancient date, went to work on the mine this week. On Tuesday, W. S. Canan, W. B. Reynolds, R. E. Lewis, C. E. Jones and R. Powell, representing the late locators, went down to the mines in the panoply of war to dispossess the alleged trespassers, but no force became necessary, as the Williams army retired in good order, and left the Healdsburg forces in possession of the field. Bud Smith brought down 25 flasks from the Oakland mine during the week ending last Saturday.

MIDDLETOWN ITEMS.—*Democrat*, August 15: The American mine has struck 80 per cent. ore. The Young America has struck cinnabar in abundance at 15 ft. The Kearsarge company are building three more retorts on their mine. The Big Indian prospects equal to any of them.

SUTTER COUNTY.

FOREST CITY.—*Banner*, August 15: From Messrs. Kimball and Smith, who have lately returned from Forest city, Sierra county, we learn the following in regard to the mines in that locality: The Bald Mountain claim, which is operated by the Bald Mountain Mining Company, is turning out big pay. The company commenced running a tunnel four years ago, and worked for two years with good prospects, when they finally struck pay, and from their first washing in 1872 they got enough to pay all expenses, and their money has paid largely, and since January 1st they have divided $100,000 among the stockholders, and the prospects of the claim are as good if not better than heretofore. The main tunnel is 3,000 ft., and there are 292,200 superficial ft. worked in the mine. The company has spared no expense in develop this claim, which is evident from their extensive and costly outfit. There is 1¼ mile of flume for washing purposes, and 2¼ miles of creek below the flume owned by the company. Recently a 60-oz. nugget was found near the lower end of the flume. Total amount of gold taken out in two years, $333,640. This is the only claim that is paying at present, although two others are being extensively prospected.

SIERRA COUNTY.

GOOD PAY.—*Mountain Messenger*, Aug. 15: Kruse & Co. are taking out fine rock at their mine on the east fork two miles above town. They have a large amount of ore in the dump and will probably erect a mill this summer.

DITCH.—A ditch will be constructed this summer, for the purpose of bringing water from Rock creek to the Green Mountain gravel claim, owned by Wm. Manson and others of this place. The ground is known to be rich.

THE Yellow Jacket gravel diggings, Forest City, formerly known as Webb's old claims, one mile below town, north side of Oregon creek, now owned by Phillips, Raymond & Co., has a tunnel about fifty feet in new ground, and breasts are now being opened out. The gravel prospected thus far is as rich as Bald mountain. Last fall a ditch was brought in from Lucky Dog creek, which furnishes an abundance of water. This is an entirely new lead, and the gold is coarse.

A COMPANY from El Dorado is fluming the north fork of the Yuba river, at New York Flat.

WORK will be commenced in Cornish's claim, below Forest City, in a few days.

CHANNEL.—The channel has been tapped by the tunnel run in the claim of Gunzberger & Co., at St. Charles hill. This is a promising claim.

TUOLUMNE COUNTY.

PLUMBAGO LODE.—*Independent*, August 15: The lode of plumbago discovered by Mr. Geo. Morgan, about two years ago, promises to become the most valuable in the State. It is situated about two and a-half miles from Columbia, and is being rapidly developed by the proprietor. In the 90-ft. incline Mr. Morgan finds the main lode (for there are several) 2 feet 8 inches thick, almost pure carbon, having but little iron, and apparently no foreign matter mixed with the mineral. There are several plumbago mines in the county; but, from present appearances, the one noticed above gives the best promise of immediate profit to the owner.

MINING AT COLUMBIA.—The mines at Columbia are paying well, and the yield, for the number of miners now at work, is even better than former years. Last week, Mr. Sevening, the express agent there, purchased and sent below $12,000 in dust, which was above the average. In July, Mr. S. purchased $25,000. The Haynes claim is one of the most extensive worked at the present time.

Nevada.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Aug. 13: The new hoisting works were started into full operation day before yesterday, everything working with the utmost precision and perfection, not even the slightest vibration or jar of the bed-plates of the machinery being perceptible. As soon as everything was in working order the water tanks were put at work, to drain the water from the shaft, and this morning the water had been lowered a distance of 89 feet, showing conclusively that the flow was not so strong but that se eon the pump could be got at work the trouble on that account would be over. The shaft is 425 feet deep and at the commencement contained 225 feet of water. The first pump will be put in at the 400 ft. station, and will have a lift of 250 feet to reach the drain tunnel. The hydraulic works are progressing steadily, doing good execution. The mill is kept steadily running on ore from the mine.

CONSOLIDATED VIRGINIA.—Daily yield 300 tons of ore from the 1,200, 1,300 and 1,400 ft. levels. The ore breasts on all of which levels are looking well and yielding splendidly. It will take about 15 days yet to secure the necessary ventilation on the 1,500-ft. level. Two months ago ground was broken for commencing grading for the company's new mill, and by the 1st of November it is expected to be in operation. The engine is one of the largest on the coast, and is a combination of high and low pressure. One of the cylinders is 48 inches in diameter and the other 24 inches. The foundation for the engine will be 33 feet long, 23 feet wide and 16 feet high, built of heavy granite laid in cement. From present indications, the mill, when completed, will be one of the largest and most substantial in this State.

SUTRO.—The main west tunnel is making excellent progress, the rock on the face blocking out splendidly; in fact, better than at any time since the tunnel was started.

OPHIR.—No work is yet being done on the 1,700-ft. level, as it is desirable that the blowers shall be put in operation before the crosscutting of the ledge on that level is commenced. The breasts from which the ore is being extracted on the 1,465-ft. level are showing a decided improvement in the quality of the ore extracted. The ore breaste on the 1,300-ft. level also show an improvement. The ore taken to the mill is yielding better than heretofore.

BELCHER.—Daily yield, 450 tons of ore. The mine is looking splendidly throughout, showing little or no change from the descriptions given in our former reports. The mills are all kept steadily running, crushing ore from the mine, and the prospects are good for the payment of the regular $5 dividend next month. Ore worked for July, 12,289 tons; bullion, $694,000; average per ton, $56.48; expenses, $316,000.

OVERMAN.—Sinking the main shaft is making slow headway, the rock in the bottom working hard. The belt of rock through which the shaft is now being sunk, is one of the hardest on the line of the Comstock, and although the progress in sinking is necessarily slow, it will make a splendid working shaft when it is done, and one that is not at all likely to soon need much repairs.

GOULD & CURRY.—Sinking the double incline winze below the 1,800-ft. level is being steadily prosecuted. The cross-cuts at the fourth station, or 650-ft. level, have developed a large and continuous body of barren quartz, but no ore that will pay for extraction.

UTAH.—The water in the shaft shows undoubted signs of abatement, as the hoisting tanks and pumps are able not only to hold the water in check, but, when under a full head of steam, to steadily, though slowly, reduce the head.

CROWN POINT.—Daily yield of ore, 500 tons, which is being extracted from the 1,000, 1,200, 1,400 and 1,500-ft. levels. The ore-breaste are looking well and yielding finely. A winze has been started in the body of ore known as the east development of the 1,500-ft. level, which is now down 20 ft., and still in very rich ore. This winze is 140 ft. north of the Belcher line.

HALE & NORCROSS.—The main incline is down 80 ft. below the 2,000-ft. level, the bottom still in hard blasting rock. Daily yield, 40 tons of ore, from the old upper workings.

GLOBE CONSOLIDATED.—The face of the main west drift on the 400-ft. level is in a solid body of clay, which is believed to be the west wall of the ledge. The winze, 95 ft. from the head of the incline, has been sunk 75 ft. below where the west drift was started. At this point another drift has been run along the ledge until it connected with the up-raise, showing the ledge to be fully as good as it was on the level above.

CHOLLAR-POTOSI.—The Belvidere air shaft is completed, giving a much better circulation of air in that portion of the mine. Daily yield, 75 tons of ore, the assay value of which is $39 per ton.

MINT.—The hoisting machinery is all in excellent order, and the work is being pushed with all the vigor possible.

LEO.—The hard rock in the face of the main tunnel is slowly but steadily giving out as further progress ahead is made, and the ledge matter improves in character as it grows softer. The seams of quartz are enlarging and give better assays.

DANEY.—The main west drift on the 400-ft. level is still driven vigorously ahead, and face in a clay quartz and porphyry.

JULIA.—Enlarging the shaft is making rapid progress, three shifts of men being employed at three different points in the shaft. The work on the foundation for the new machinery is also making good headway.

DAYTON.—The water is reduced and held below the second station level, and preparations are being made to resume work on that level. The putting in of the new pumps is making rapid headway.

OCCIDENTAL.—Cross-cutting the ledge below the tunnel level is still vigorously prosecuted, showing a large body of low grade ore, and some that will pay well for milling.

DARDANELLES.—New shaft down 84 ft. today. It is being substantially timbered throughout, and the work is being pushed ahead with energy and in a workman-like manner.

PICTOU.—Main tunnel still actively progressing toward the ledge, it being now in nearly 500 ft. The rock being softer, better progress is being made.

NEVADA.—Still driving the new tunnel into the hill to open the new level. Face of tunnel in ledge matter, with occasional streaks of ore.

CROWN POINT RAVINE.—Driving the south drift on the 300-ft. level is making good progress, the ore in the face being spotted, but of good quality.

CALIFORNIA.—Both the north drifts on the 1,400 and 1,500-ft. levels are making excellent progress. Nothing new.

GENESSEE, No. 2.—Sinking is actively resumed at the bottom of the new shaft, and good progress is being made.

KOSSUTH.—The new machinery is all in place, everything working with the utmost perfection.

WOODVILLE.—The mine is looking well throughout. The mill is kept steadily running.

YELLOW JACKET.—Driving the main east drift on the 1,740-ft. level is making steady progress, the rock in the face still blasting quite hard.

JUSTICE.—Sinking the main incline is making good progress, the bottom in a mixture of clay, quartz and porphyry. Sinking the Waller shaft is also making good headway, the bottom being in solid quartz and low grade ore.

KNICKERBOCKER.—Sinking the main shaft is making good headway. It is now down 40 ft. below the 600-ft. level.

SUCCOR.—The Grant shaft is cleaned out and repaired to a depth of 250 ft. from the surface, and the work is making good progress. Three hundred and twenty tons of ore were crushed last month, which yielded $6,700.

TYLER.—Everything is now in good working

[Continued on Page 124.]

Reclamation of Tule Land.

EDITORS PRESS:—In relation to the report of General Sherman Day and myself, on the investigation and survey in view of the reclamation of swamp land, District No. 107, and the improved method recommeoded by us to reclaim the same, permit me to submit the following:

The investigations we were directed to make, were commenced at a dam thrown ocross the mouth of Rooky slough, near the shore of Old river, and extended along the bank of the river to Indian slough, thence along Indian slough to the uplond. We instituted a series of boriogs, at intervals, along the whole route, some taken iuland, but mostly at the bank of the river.

As the borings progressed, soundings with a lead were taken at distances of 20 to 50 feet from the shore, to determine the depth of the river and ascertain the character and quantity of material that could be obtained from that source for levee pnrposes.

The details of these examinations, illustroted with diagrams ond cross sections, together with explanatory field notes, accompany our report, but are omitted here.

The brown, peaty and spongy surface, peculiar to low tnle londs, was found to average along the bank of the river about seven feet in thickness, forming a teoaceone, elastic crust, composed of tough tnle roots and interloced fibrous matter, with o slight sdmixtnre of sediment and vegetsble mould, grodually softening downward nutil it becomes almost semi-fluid at the bottom. Where the peaty crust ends, an under stratum of the consistency of an ordinary mud bor begins. This formation, extending from the river bed inland, gradually hardens downword until tough blne cloy, restiog on hard pan (so-called) is reached, tbe depth vorying from 15 to 24 feet from the surface of tbe land. The compositioo of this formotion is priucipally clay and very fine sand, with a slight admixture of mica and sulphuret of iron, the proportions slightly varying at eacb boring. This material hos not the solid consistency necessary to make a levee of, but combined with the tough, peaty surface, is considered admirably adopted to the purpose.

The examinations made by inspection and boring satisfied us that the general character of tnle lands bordering on the San Joaqnin river and its branches, as here described, were identical. Tbie peculiar formation, marvelously fertile, commencing at nothing at the upland, was fonnd to attain the greatest depth, some 30 feet to hard pan, along the banks of the main river.

We did not chain the distance from point to point where the borings were made, but we selected those placse which indicated soft formation and treacherous foundations for building a levee upon, and which had caused the greatest trouble and expense from breoke and keeping the levee in repair, and there made the tests with the greatest care.

This we did to eatisfy ourselves with regard to the practicability of building a substantial and permanent levee upou tbe worst places, and at a reasonable cost, with the material at hand. Of this, there is in our minds no question, st a cost not to exceed $3,500 per mile (there being 26¼ miles extent of levee), nor more than $10 per acre (there being about 17,126 aores) assessment on the land witbin the district, to cover cost of canol from Point of Timber to Dutch elough, as well as catcb-water to collect and carry off the rain fall from the uplands, flood gates, repairs, ditches, draio and all.

The sedimentary deposit or mud bars, which will be used in part as material to build tbe levee of the plan proposed and heretofore explained, will be found along the shore.

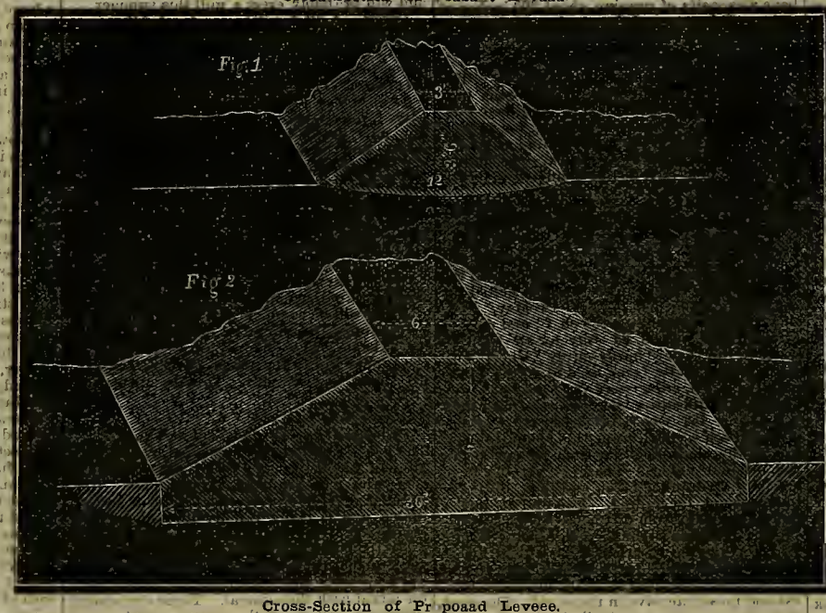
The brown, spongy, light and peaty materiel, of which the present line is built, is found unsuitable to the purposo. It shrinks to that degree, when dry, as to leave fissures or cracks in the top of the levee from two to two and a half inches wide per lineal yard, which not only pass wster, during high tide, from the river to the land, but destroy cohesion and lateral stability of the structure, as well as its power of resistance to hydrostatio pressure, and permanence.

To thie oause all the breaks, inundations of the land, destruotion of crops, and pecuniary loss to owners, so lately experienced aud severely felt, are attributable.

From these investigatious, oarefully made by the surveying party, consisting of General Sherman Day, the undersigned, Captain J. A. Welch, J. C. Stump and others, it was apperent to all, that the present levee is not only badly built, but is improperly located some 90 feet from the river shore, on soft and yielding ground. It was found by the borings that tbe peaty formation, overlying the clayey material end hard pan (so called), was greater inland than neor the river hank, the only place where a levee, on tule land, oan he safely located. As to the method of building a levee properly located and constructed, which we believe can be done, we would recommend this. In all cases the work shsll be preoeded by ooreful horing, to ascertain the depth of the peaty formiotion, ond whether any snbterraneous possages which do sometimes occur, underlie the surface, forming a crust of varying thickness, called float land, of snfficient streogth to support cattle, and even the levees. In front of Csptain Lockhart's ranch, the sounding rod, while boring, dropped five feet from the bottom of the float land to tbe top of the soft earth stratum beneath.

The next step ehould be to stake off the base lines of the levee 30 feet aport, and 25 feet from the outside line to the brow of the river bank. Tracing out these base lines, an incisio'n with a sharp tule knife some four feet long, through the tough surface, down to the less tenacions and soft material below, ought to be made, to completely detsch this continuous belt from the adjacent surfece of land, as a foundation upon which the levee will be built. The work of buildiog this levee will be commenced by coatiog the surface of this belt with plastic material, token from the river bed witb a dredge, and deposited in place, tbus forming a ed, as it were, of mortar. Upon this bed of

Cross-Section of Prasa t L vaaa.



Cross-Section of Pr poaad Leveee.

ortor a course of peaty material, taken from the odjoining drain and the present levee (by utilizing which a great obstacle and an ugly feature will be removed from the land), will be laid and well grouted with tbe semi-fluid substsnce, dredged from the river so that every crock or interstice shall be filled. The mauuer of doing the work, will be similar to the construction of a wall of rubble masonry, built up iu courses with full beds of mortar, grouted in every course. As the levee or wall, composed of impervious earth and peaty materiel, is carried up, ou this continuous detached belt, described above, tbe levee from the superiucumbent weight or load, will slide downward in the groove, made in the land by the siuking of the detached belt, lubricated by water, until the whole moes settles and rests permanently on the sub-stratum below. The flexibility of the levee, from its composition of peaty substance and plastio material, will adapt itself to tbe undulations of the earthy substratum, and thus form, when io place, a perfectly impervious barrier to tbe iogress of water, from tbe river and tides, whether obove, or below the surface of the land. And we hold that the woter wall stondiug alone, iudepeudeut and detachod as it will be, will stop land-cracks, that often occur, to the full depth of the peaty formation, varying from seven to 25 feet, as for iostance in Twitchell Island, where a crack opeued a wide channel to tbe river, letting in the water, and flooding the land.

The foundation of this levee will differ from the one built in the usual way, inasmuch as the base of tbe latter rests on the surface of the ground, on which, when tbe tide is high, the hydrostatic pressure is great; by virtue of the force exerted against it, and the seepage and currenté of wáter under it, which first lifts and lubricates, then slides, and breaks the levee and floods the land. Whereas the former (the levee proposed) will have its base two feet below the surface of the land, and is thus supported by a shoulder or prop of earth behind it, which prevents sliding, aod gives the levee statical rosistence that will render it solid and immovable.

It will be necessary during the progress of the work, ond from time to time after the levee completed, to keep the top at a true level.

Fig. 3 in the accompanying diagram shows a plan of the foundation belt, wbich is cut, as described in the accompanying "Report," 25 feet from the river shore.

Fig. 4 shows a cross-section of levee for closing sub-passage, in coonectiou with a section

Plan of Foundation Belt.

Fig 4.

of the bank. Referriug to figure, *b* represents the bank of the river, *c* the peaty material, *d* the sub-stratum, *e* the sedimentary matter, *f* tbe sub-passage closed against the iogress of water.

The dimensions of the finished levee at the base will be the full width of the peaty 30-foot belt, six feet wide at the top and six feet high from the ground surface, with slopes two horizontal to one perpeodicular. It is assumed from what is known of other levees, as for instance that of Sherman Island, the best example on peaty land, Graud Island beiog the best found on sedimentory land, that the levee under consideration will settle on an average two feet, the point ot which the levee slopee will begin; this will give 12 squore yards area of cross section above the surface, and 6.66 square yards below the surface, or 32,841 cubic yards per mile. What number of cubic yards will settle below the surface, in very soft ground, or at subterraneons places, which bear a small proportion to the whole, can only be determined by practical experience. The same may be said of the dredging from the river, and depositing the plastic or gronting material on the levee. Enough, however, is ascertained from estimates made by reliable parties, willing to contract for the doing and completing the work in accordance with the plan described, to judge with s great degree of certainty, that the cost of labor and dredging will not exceed 10 cents per cubic yard.

The pertinent query will naturally arise in the minds of many, why the material from the river alone, raised by the dredge and deposited on the foundation belt, without the admixtore of peaty substance, would not answer as well or better than the method proposed? The answer is:

First—That the peaty material in a levee will not be cut by the passage of water over it, while clayey material cuts rapidly. The two combined however, we think, will answer a better purpose than either aloue.

Second—That the material found in the bed of Old river, which will be used for levee building, is, for many feet io depth—in fact, to the thin stratum of bluo clay overlying the so called hard pan—of such a pasty and semi-fluid consistency tbat, when dropped by the dredge into place, would flow or run like mortar. If time could be taken, which would be considerable, and doubtful as to the extent, to dry the material, with the daily action of the tides upon it, the thiog might with great difficulty and at heavy expense be done; but when done, it would probobly be little if any better than o levee made by the plan here recommended. Besides, it will hardly be claimed that the portion of the clayey levee which settles under the tide-level and land-surface, while beiug built,—to say nothing of its situation in soft, low, wet ground, or in subterraneous passages, where the work would be subject to constont saturation aod hydrostatic pressore—would dry or solidify sufficiently to resist that pressure, or exclude the water from the land for any definito period, if at all.

T. R. SCOWDEN, C. E.

Oranges, Lemons and Limes near at Home.

Have these fruits had a fair chanco at growing in the vicinity of San Francisco? It will hardly do to leave the question of our ability to grow oranges and other semi-tropical fruits to be decided by the popular impression, for that is over-exacting os to the degree of heat supposed to be required. There is a mistakeu notion generally prevailing on this point. People evidently suppose that an almost perpetual warmth and evenness of temperature is essential to orange culture; hnt oranges, lemons and limes will bear more cold than people generally suppose. In Italy the orange trees are sometimes covered with snow, but tbeir frnit is koown as tbe best in the market; and in Los Angeles there are sometimes frosts, witb thick ice in wiuter, and it is well known that the orange troe will grow and beer fruit in San José, San Lorenzo and many other places. The temperature of San Francisco and its vicioity is not too low at any season to admit of the growth of tbese splendid semi-tropicals; but whether the climatic variableness would be a hindrance ie o question which yet remains to be decided. Until this question is thoroughly settled, we should not desist from the cattempt. Those at least who wish to surround their homes with beautiful trees, bearing gorgeous and frsgrant blossoms, moy safely rely on accomplishing this porpose by planting a few orange trees. Sbould the frnit mature, they will have the additionel luxury of this glorioos frnit thoroughly ripeued on their own trees; and then froit grown on one's own trees does taste a little better than that of the same quality procured in any other way. Even though the oraoge may not be able to withstand the ups aod downs of our somewhat fickle climate, tbe lemon ond lime msy succeed, for they are hardier thon the orange.

The limite of orange culture are far less restricted than are the popolar impressions on this snbject. The tree has grown thriftily and matured its fruit even at Coloma. It is not much inferior to the peach in hardiness. Its cultivation in California has apparently been satisfactory in every respect to those engaged in the business; and those who have had most experience in orange growing are the most liberal in extending the latitude in whioh the growth of it may be safely undertaken.

FROM Tyho we learn thot quite an excitement pervades that community over the favorable reports concerning the recently discovered mines in Jefferson district, situsted thirty miles northwest of tbat place. All the men not engaged at steady work have left, or are preparing to leave for the new discoveries. The mines are situated in Jefferson cañon, and thus far the prospects are most encouragiug. Two mills are in course of erection, one of which is nearly completed; and soon the obeerful music of the stamps will resound throughout the cañon. The arrivals to the new camp are numerous, and embrace all the well known characters that are always seen flocking to a new excitement, and who are always confident that a fortune is awaiting them.—*Eureka Sentinel.*

KRUSE & Co. will soon erect a 10-stomp mill upon their claim near Downieville, Sierra county.

Useful Information.

Artificial Stone.

There are two ways of making artificial stone. The first and oldest is simply to burn clay; the result is called brick; and is obtained in different degrees of hardness, according to the degree of heat employed in the burning. The softest are those burnt at a low degree, and called after their color, salmon brick, while the hardest, burnt at a high degree, very near the fire, dark, sometimes glazed on one side where an incipient infusion took place, and occasionally almost black, are best adapted for paving stones. Again, when the clay has been made more compact by previous pressure, a heavier, smoother, and less porous brick is the result, called pressed brick. The quality depends, of course, also, on the quality of the clay used. Very fine qualities make different kinds of pottery or stone-ware, and the purest of all, porcelain; but all depend on one principle, the baking together of the constituents by heat; in fact, an incipient fusion.

It appears that the oldest material for cementing bricks and stones together was asphaltum. The most ancient monuments found appear to demonstrate this. For instance, in a certain very old ruin, found in Asia, and said to be the remnant of the celebrated tower of Babel, the bricks are all cemented with asphaltum; and it is remarkable that after so many thousand years the more extensive use of this material is again revived. Soon, however, the knowledge of burning lime was obtained, and its property of hardening when slacked and mixed with sand, was discovered. Such a mixture of burnt lime and sand, which is mortar, forms, when dry, also an artificial stone; and, in fact, a good mortar placed between the bricks, and submitted to proper pressure during the hardening process, forms a single stone to all intents and purposes. Some stones, like granite, basalt, etc., do not unite well with mortar, while more porous ones, like brick, sandstone, and the like, form a very strong union.

With these preliminary explanations, the reader will easily understand how artificial stones may be made without the use of fire. It is simply by mixing substances similar to those forming mortars; and if a dense stone is required, submitting it to pressure. The value of the product depends thus on two things, the proper materials to commence with, and the treatment to which they are subjected—very fine previous grinding, and sufficient pounding or pressure, being the chief requisites of the latter.

As it is less expensive to mold different shaped small objects from a plastic substance than to cut them out of the solid natural rocks, the natural cut stone finds a strong competitor in this artificial stone, which, moreover, during the drying and hardening process is not subject to any shrinkage, such as is produced by fire in the baking process. It is impossible to bake large flat surfaces, required for slabs and tiles, except when a very coarse grain is given them with a great excess of sand, and just enough clay or plastic material to keep the sand together. In fact, this is the way in which are manufactured the celebrated Dutch tiles, imported by our forefathers into this country, occasionally found in some old houses in the earliest settled portions of the land, and to the present day most extensively used in the Levant, for the trade of which Holland still sustains extensive tile-bakeries in Delft and some other cities. The artificial stone tiles now produced in the country promises to maintain a strong competition with these, when their value commences to be understood. But the manufacturers will not confine themselves to tiles only. We have seen a number of capitals, balusters, lintels, crosses and monuments for graveyards, of beautiful design and finish, and, in a variety of colors imitating natural stone. For these purposes, the artificial stone is not only cheaper (it costs one-half as much for tiles, and for more elaborate objects still below that), but also stronger and harder than any natural stone. To understand this, we have only to bear in mind that the compounds in question are silicates, while the natural marbles are only carbonates. The first are not attacked by acids nor the weather; the latter are to a greater or less degree.

Another peculiar virtue of this artificial stone is, that it improves by age. While our brown sandstone deteriorates, and, in many instances, slowly crumbles away on the surface, this artificial stone becomes harder and harder by age; in fact, it sets slowly to an extraordinary degree of hardness.—*American Homestead.*

What Coal Loses by being Made into Coke. From an exchange we learn that Connelsville coal, which may be taken as the standard of coking coals, weighs 80 pounds to the bushel. When properly coked, 100 bushels of coal yield 125 bushels of coke, weighing 40 pounds to the bushel; that is, 8,000 pounds of coal produce 5,000 pound of coke, or, in other words, the coal gains 25 per cent. in bulk and loses 37½ per cent. in weight.

Rendering Fabrics Water-Proof.—Dissolve one part by weight, of caoutchouc, and one of paraffine or stearin, in two of benzine; dilute as much as necessary, and either saturate the fabric with it, or lay it on with a brush.

One hundred barrels of crude petroleum will make about 75 barrels of refined oil on an average.

Generation of Ozone.

Dr. Brigham, in the *Herald of Health*, says: Thunderstorms are generators of ozone, so it is supposed, though Rolshuber thinks that the amount of ozone which is left after a tempest depends more upon the quantity of rain which has has fallen than upon the abundance of the lightning. It is agreed that there is more of it in the air in the winter months than in the summer months, in the wet season than in the dry season, in cold weather than in hot weather, at morning and evening, and even in the night, than at noon. In this respect it goes with electricity, for it is a common mistake to suppose that electricity is more abundant in summer, because thunderstorms come in summer. As a rule, the air is far more electrical on a tingling, frosty day than upon a sultry, debilitating day. According to observations made in Germany, the average of ozone is nearly double on snowy days, and is considerably greater on rainy days than it is on clear days. Fog is unfavorable to its production, but a driving snowstorm greatly promotes it. This may, nevertheless, be the effect of wind in clearing the air. The authorities differ widely in their conclusions about the winds which are ozone producers, some assigning more to winds from the east, others rating more highly winds from the west. Cold winds bring more than hot winds; and those whose houses are exposed to cold winds have this compensation, that if they burn more coal, they probably get a better quality of air.

The following extract from the report of Mr. F. M. Allen, Chief Engineer to the Hartford Steam Boiler and Inspection Company, deserves perusal: In some parts of the country crude petroleum has been found to keep boilers free from scale without injury to the iron, while in the same districts, and in the immediate vicinity, boilers not using purgers would have a scale from one-half inch to three-fourths inches in thickness. We have a specimen of scale in this office nearly one and a-half inches thick that was removed from a boiler in the West by crude petroleum, or what is known as unrefined black earth oil. I am aware that there is a great prejudice against using anything of the kind in steam boilers, but earth oils are very different from animal oils. They are very volatile, and in an experience of several years, where hundreds of boilers have been treated with them, we have found no injury to plates or tubes, and the boilers have been kept free from scale. Petroleum works better where sulphate of lime predominates, than in waters impregnated with carbonate of lime. We would not advise it in connection with the latter. I desire to impress upon all persons the importance of careful attention to their boilers when solvents of scale or purgers are used. It often happens that scale is thrown off and allowed to accumulate on the bottom of the boiler, and from want of attention, not being removed, the boiler becomes nearly or quite ruined. If a purger is used the boiler should be often opened, and as often thoroughly cleaned.

About Nails.—Every farmer who has occasion to drive a nail into seasoned oak posts knows its liability to bend and break. If the point be moistened in the mouth, it will usually drive more kindly. Oil is better, but then it is inconvenient to dip each nail separately into it. Another point is, that boards become loose eventually from the rusting of nails, which, communicating to the wood, causes not only an enlargement of the nail-hole, but the wearing away of the nail itself, rendering the fence or building shaky or insecure. This may be prevented by heating any rough grease until it smokes, and then pouring it over the nails to be used. The grease will penetrate the pores of the iron, and cause the nails to last without rusting for an indefinite period. Besides this, no difficulty will then be experienced in driving them into the hardest wood. The reason is, that the coating of grease prevents contact by air, and consequently oxidation. Oxygen is the great destroyer of iron, and moisture is the inducing cause. Anything which is kept from air is preserved indefinitely, and if it is kept dry the effect is measurably the same. Paint upon buildings prevents the contact of air and moisture. If the whole fence can not be painted, the heads, at least, of the nails therein should be touched.—*Newark Builder.*

To Harden and Bleach Tallow for Candles.—Take of tallow, five pounds; alum, one pound; water, sufficient. Dissolve the alum in water, add the tallow, bring the mixture to nearly the boiling-point, and stir well together. Then allow it to rest a short time, draw the water liquid out, and cast the tallow into the proper moulds. It is said that candles made in this way are as hard and white as wax.—*Druggists' Circular.*

Transparent Gum.—A little glycerine added to gum or glue is a great improvement, as it prevents the gum or glue becoming brittle. It also prevents gummed labels from having a tendency to curl up when being written on.—*Gaslight Journal.*

The solvent power of petroleum adapts it for use in the cleansing of steel articles. It does not become rancid or gummy, as is the case with other oils.

The parts of plants seldom leave, when burned, more than five pounds of ash from every 100 pounds of the dried plant.

Good Health.

An Antidote for Mercury and Lead Wanted.

Many of our Western and Southern doctors pour in the calomel and blue pill for almost everything, as freely as the profession used to do in former times. Since this is so, and since the other medical schools have not yet furnished a practical substitute for mercury, the great want in medicine is a counteractor for a remedy often as bad if not worse than the disease. Chemistry and experiment must help the doctors, and still more the sufferers from mercurialization, if it be possible. Chemists and physiologists long ago found two, and only two, efficient agents, capable of rendering mercury in the system harmless; and these two substances, namely, iodine and sulphur, happened also to be the best naturalizers of another common cumulative poison, lead. But the difficulty was and is to cause the assimilation of iodine and sulphur, or either. Sulphur is nearly insoluble in any menstruum capable of being taken into the stomach. Iodine is very soluble in alcohol, oil, etc., and even in water to some extent, but largely soluble as iodide of potassium, a drug now used to excess. Unfortunately this iodide, also the tincture, are but slightly assimilated, passing off by the bladder. The small amount of iodine contained in that well known organic substance, cod liver oil, would be likely to prove more effective as an antidote to lead and mercury than a large quantity of iodide of potassium, because the organic oil enters into the blood and tissues. We put forth the suggestion that some vegetable may be found which is rich in iodine, also other plants, and harmless ones, may contain sulphur in an assimilable shape, for sulphur is an exceedingly common element of organisms in general. If we could have strong extracts of such plants, the object spoken of would be accomplished. In that case, our calomel givers could salivate their patients to their heart's content, and have them live through a dozen courses of mercury, a matter of profit and pleasure to every regular doctor.

Thousands of cases of chronic rheumatism, as well as consumption and other fatal diseases, have been traced to the use of mercury. Lead poisoning has become alarmingly prevalent of late years, producing colic, constipation, hardened liver, neuralgia, nervous dyspepsia and paralysis, which sometimes attack people in the prime of life. We will not discuss the question of lead in water pipes farther than to observe that every decent chemist knows that pure water acts on lead with astonishing quickness. To have water pipes, as used at present, coated internally with a sulphide or sulphate seems to be the only good practical preventive of lead poisoning. But in the case of lead pipes kept for weeks in hogsheads and barrels of ale and cider, there the solubility is certain and its effects destructive or pernicious to no small degree. Such dangerous nuisances should be abated by law. Again, soda fountains where the water, highly charged with carbonic acid, acts on lead, and sometimes on copper in old fountains, are things deserving of legal attention. Many of the hair dyes in market, and some of the cosmetics, are well proven poisons.—*Scientific American.*

Digestive Powers of a Sailor's Stomach. An American sailor, named John Cummings, died in 1808, in Guy's Hospital, London, under the care of Dr. Currie. The post mortem examination verified his statements, which the doctors could before scarcely believe, that his disease was due to his repeated exploits of swallowing knives, from the effects of which he had been sick for three years. The first time he swallowed 14 knives, became sick, but recovered, and commenced again, hotting from time to time on his bravado exploits. While a prisoner on an English ship, in 1805, he swallowed 17 knives in two successive days; but this appears to have been too much, and after long suffering he died. Fourteen of the knives were found in his stomach, but strange to say, partly digested, the iron parts as well as the horn handles; the silver mounting, however, was scarcely touched. The stomach itself was not at all injured; he had a good appetite to the last, and his sickness and death were alone caused by the haft of a large knife becoming fixed across the intestines. This shows that the gastric and other juices of a healthy stomach have the power to dissolve finally not only horn and bone, but even iron and steel, but not silver.

Doctors.—We do not agree in the view that the physician will ever become a useless member of society, for the simple reason that, instead of decreasing the share of his duties, the culture of preventive medicine—of the knowledge of how to prevent diseases as well as to cure them after they are engendered—must tend to amplify and enlarge the same. His will be the task, not merely to recognize the forms of ills and endeavor to combat their effects, but to look into the future and, through the aid of all circumstances of the present, predict possible evils and point out means of defense. Add to this the constantly increasing knowledge of drugs and their properties, of the wonderful relations of mind and body, of the nature and habits of disease, which science is rapidly developing, and the physician of the future has before him not a narrower but a far wider field for the exercise of his skill.—*Sci. Am.*

Sun-Baths.

These cost nothing and are the most refreshing, life-giving baths one can take, whether sick or well. Every housekeeper knows the necessity of giving her woolens the benefit of the sun, from time to time, and especially after a long absence from the sun. Many will think of the injury their clothes are liable to from dampness, who will never reflect that an occasional exposure of their own bodies to the sunlight is equally necessary to their own health. The sun-baths cost nothing, and that is a misfortune, for the people are still deluded with the idea that those things only can be good or useful which cost money, and they will cheerfully pay away their dollars, for Turkish and Russian baths, when they could get any number of sun-baths, which would be far more beneficial to them, for nothing.

Let it not be forgotten that three of God's most beautiful gifts to man—three things most necessary to good health—sunlight, fresh air, and water—are free to all; you can have them in abundance, without money and without price, if you will. If you would enjoy good health, then see to it that you are supplied with pure air to breathe all the time; that you bathe for an hour or so in the sunlight; that you quench your thirst with no other fluid than water.

In regard to sun-baths, let any invalid who reads this, and who has been housed for some time, take an occasional walk in the sun, if it should be only on the piazza, and observe the effect. In our opinion he will find it the most healthful bath he has ever taken. Sleeping rooms should be selected in such parts of the house as have the most benefit from the rays of the sun. The bed and bedcloths should be aired and kept in the sun as long as possible every day. Many of the sleeping-rooms in the hotels are so situated as never to feel the sun's rays, and those who occupy such rooms for any length of time are simply committing suicide.—*Household.*

Short-sightedness is a malformation of a somewhat serious nature, as short-sighted eyes are diseased eyes, and they require special treatment. Never allow a child or friend thus afflicted to fall into the hands of "traveling quacks," or those who make loud claims to optical volatile. In all large cities there are reputable medical gentlemen who make a specialty of the treatment of eye affections, and they are the proper persons to consult. It cannot be too universally known that short sight tends to increase; and that if it increase at all rapidly, it tends also to destructive changes, and therefore it is an affection which requires prompt attention. Perfection of sight is essential to our welfare and happiness, and any one who neglects those precautions upon the observance of which its preservation depends, will find cause for deep repentance in later life. Young men and young women who suffer themselves to fall into the habit of reading by fire-light, or at a window by the waning light of evening, or at a considerable distance from lamps and gas-burners, are guilty of acts for which they must suffer. Parents should promptly interfere to prevent the formation of such dangerous habits.—*Boston Journal of Chemistry.*

Hydrate of Chloral in Hooping Cough. Dr. Bordley commends chloral hydrate in hooping cough. The dose, of course, must be regulated by the age of the patient and the severity of the attack, care always taken to observe the peculiar susceptibility in each individual case; as some children are much more susceptible to its action than others, as much so as is the case with opium and its preparations. He commences with a half grain for a child one year old, and increases half a grain for each additional year, and repeats every three or four hours. After noting the effect of that dose, he increases it from a half to one grain each day, according to the severity of the attack and the peculiar tolerance of the medicine. The "compound syrup of sarsaparilla" is a good vehicle for its administration, as it masks the taste and destroys the pungency of the chloral effectually.

Good Living.—Privation of food, not of quality, to some men who gain their living by literary pursuits, is most trying. Mental labor after a certain period of life, even to those not fastidious, requires a certain kind of pabulum. The steam will not rise, the brain mechanism will not work, without the proper fuel. Some men's capacity could be gauged by what they eat. Suppose Thackeray put for a year or two on a regime of corned beef, Dickens on a diet of bacon, or Bret Harte on a fare of scrapple, and it is questionable whether "Henry Esmond," or a "Tale of Two Cities," or the "Outcasts of Poker Flat," could have been written.—*N. Y. Times.*

Paris Green.—As an antidote for poison, the free use of milk as a beverage is recommended, but hydrated peroxide of iron is better. Sores caused by the green should be well covered with this, as with an ordinary salve, and a teaspoonful in a wine-glass of water should be taken twice a day, internally, while working with the green. This remedy can be obtained from any druggist or chemist.—*Journal of Chemistry.*

Cooling Drinks.—Infusions of flaxseed and bran and sage seed are recommended as forming very agreeable and useful drinks in fever, and their diaphoretic powers may be increased by the addition of the sweet spirits of niter or antimonial wine.

MINING AND SCIENTIFIC PRESS.

San Francisco:
Saturday Morning, Aug. 22, 1874.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Academy of Sciences; Water Nuts; The Industrial Fair Building, 113. Quicksilver Crazy, Sonorous Sand; The Blue Jacket Mine; Take the Boys Around, 120. Address of the President of the Mechanics' Institute; Mining with a Rocker, 121. The Pavilion by Gaslight; Mining Accidents; General News Items; Patents and Inventions, 124.

ILLUSTRATIONS.—The Mechanics' Fair Pavilion, 113. Cross-Section of Proposed Levees; Cross-Section of Levee Wall for Closing Sub-passage, 118. Mining with a Rocker, 121.

SCIENTIFIC PROGRESS.—Vivisection; Heat-Conducting Power of Rocks; The Chronograph; The Aerophore; Recovery of Silver from Cyanide Baths; Saffranin, 115.

MECHANICAL PROGRESS.—Coining; Lubricating Packing; The Invention of Screw Propulsion; English Railway Signals; Simple Leveling Instrument, 115.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 116.

MINING SUMMARY from various counties in California, Nevada, Arizona, British Columbia, Colorado and Idaho, 116-117-124.

USEFUL INFORMATION.—Artificial Stone; What Coal Loses by being Made into Coke; Rendering Fabrics Water-Proof; Generation of Ozone; About Nails; To Harden and Bleach Tallow for Candles; Transparent Gum, 119.

GOOD HEALTH.—An Antidote for Mercury and Lead Wanted; Digestive Powers of a Sailor's Stomach; Doctors; Sun-Baths; Hydrate of Chloral in Hooping Cough; Good Living; Paris Green; Cooling Drinks, 119.

MISCELLANEOUS.—Quicksilver in Sonoma and Napa; Mint Items; The Sierra Nevada Hoisting Works; The Black Hills; A Valuable Coal Mine; Mining at San Juan, 114. Reclamation of Tule Land; Oranges, Lemons and Limes near at Home, 118. A "Growing" Evil; Water Locomotive; A Perilous Position; Our Great Hotel; New Boiler; Newly Discovered Mines in Nevada; Black Diamond Coal Mine; The Maxwell Ditch and Mining Company; Signalling to the Driver in Vehicles; Self-Feeding Copying Brush; Salt in Nevada; The Visalia Branch Railroad, 122. Encourage the Prospectors, 123.

UPON a ranch in Nevada, on the Carson river, there is a herd of twenty-six camels, all but two of which were bred and raised in Nevada. Some years ago nine or ten were imported into that State, but of these only two lived to become acclimated, and from this pair have been raised the twenty-four. They are used in packing salt to the mills on the river, from the marshes lying in the desert, some sixty miles eastward.

MUCH prospecting is being done in Silver Lake district, and it is thought that several good mines of argentiferous ore will be opened in that region at no distant day. The Silver Lake mining company, the chief company in the district, are making regular daily shipments of ore to the new smelting furnace at Sacramento.

HORACE ADAMS, of Sacramento, has commenced the construction of a Corliss engine of 150 horse power, together with the necessary boilers, shafting, etc., and a 20-stamp mill for the Park silver mining company, Uintah district, Utah. It will require about three months to complete the works.

P. VAN METRE has this season taken 150 ounces of gold from his claim at Dutch gulch, Trinity county. He says that of this amount not more than half an ounce could be classified as dust; the remainder was in pieces weighing from one dollar upwards.

THE present average daily yield of ore from the Crown Point mine is 500 tons, from the Belcher, 450 tons, and from the Consolidated Virginia 300 tons, making a total of 1,250 tons from three of the leading Comstock mines.

ANOTHER cinnabar mine has been discovered about 30 miles from Monterey, by a prospecting party from San Francisco. Lead and silver are thought also to exist in the same lead.

THE average daily shipment of ore by rail, from the Comstock mines, amounts now to 1,725,000 lbs.

A FOUNDRY is proposed at Dilley station, on the west side road, in Washington county, Oregon.

OVER 14,000 persons have arrived in the State by rail since the 1st of April.

A SURVEY is now being made for the projected ditch on Scott river, Shasta county.

Quicksilver Crazy.

The quicksilver excitement in this State runs as high at present as any of the numerous gold mining "excitements" of days gone by. In fact it is impossible to estimate the number of people who are "quicksilver crazy." This excitement differs from those which have occurred formerly, in several particulars. In the first place it is confined to no particular locality but is wide spread over the State. It is not in some almost inaccessible place where the miners look for their treasure, like Frazer river or Stickeen, but throughout the Coast range, where the climate is good and traveling is comparatively easy. It is not only *miners* who are looking for quicksilver, but people of all classes have turned prospectors for the time being, and travel over the hills in search of cinnabar.

The high price of quicksilver, the accessibility of the localities where it is found, the broad area of country where it is likely to be met with, and the value of a good mine, are all incentives which combine to keep up the excitement. Like all other excitements, however, people are apt to be carried away by enthusiasm and do foolish things. Red rock or dirt will excite a miner now-a-days as much as a red rag will a bull. A piece of red rock of any kind found in any part of the Coast range will set some one digging on the spot to find a quicksilver mine. It does not make much difference about the kind of rock or dirt as long as it looks red; that is the most important point. People without the least pretensions to mineralogical knowledge will decide on the subject of cinnabar with the gravity of an expert. They will discourse learnedly about vermilion, serpentine, ledge, etc., and by a judicious admixture of mining terms endeavor to lead people to think they know what they are talking about.

Unfortunately this class of people is somewhat too numerous for the good of the country. We want more mines and more quicksilver, and we need capital to develop the mines and get out the quicksilver. Misrepresentations may, in a few instances, be beneficial to individuals; but in the long run it must necessarily be disadvantageous to a prominent industry of the State. It is very difficult now to induce capitalists to invest in quicksilver mining; and if more difficulties are thrown in the way, few of the claims discovered will ever be developed sufficiently to prove their value. Some of these prospectors, new to the business, undoubtedly deceive themselves, and oftentimes do work on claims of no value. We heard of one instance the other day of a man who was prospecting for cinnabar, and doing it on a salary for parties in this city, who was working away in a reddish clay, firmly convinced that he would soon strike cinnabar ore. This was almost inexcusable, since with a simple blow-pipe and a gold coin he could have told whether he had cinnabar or not.

As an instance of how far people will be carried away just now by anything red, we may cite the following: A well-to-do miner from Idaho, while in this city a short time since, was shown a piece of rock from one of our northern coast counties. Through this piece of rock was a broad streak of reddish hue, which was called cinnabar. There was plenty more of the same sort of rock, and the result was that he thought if he was possessor of that mine he would soon be a millionaire. He actually paid for it $30,000 in cash, and shortly after found that he had plenty of red jasper in his "mine," but no cinnabar. He did not say much about the matter, but has gone back to Idaho a wiser man. Whether he will prospect for cinnabar up there or not, remains to be seen, but we do not think he will buy any more mines.

CHERRY CREEK MINING DISTRICT now presents a lively appearance, and bids fair to be a prosperous mining center. Of the mines being worked, the Teacup and Chance, both lying on the same belt, are most prominent, and are shipping large quantities of high-grade ore. Superintendent J. B. Stanford, of the former mine, who is now in this city, brought down with him $6,000 worth of bullion, the result of 20 tons of ore worked in the Chance mill. The ore is of an exceedingly rich character, and is easily milled, working up to within 70 per cent. of assay value. The Exchequer mine, which is located on the Genova belt, is the property of the Cherry Creek Mill and Mining Co. It has a fine body of ore, and keeps their 5-stamp mill busy. The Flagstaff, Little Maud and Starr mines look well, and are now shipping ore.

NEW discoveries of cinnabar have recently been made in Santa Clara county, in the vicinity of Red Mountain. Prospectors are now in the field and report that they have made a good find, but refuse to give the precise location of their mine.

HOISTING works are being put up on a mine situated above Nevada City, formerly known as the Allison mine, by a company of practical miners principally from Grass Valley. These parties have recently purchased the mine and are meeting with encouraging prospects.

THE Virginia and Truckee Railroad company have made arrangements with the Central Pacific Railroad company for a sleeping car between Carson and San Francisco, leaving Carson Mondays and Thursdays, and San Francisco Sundays and Wednesdays.

Sonorous Sand.

A short time since Mr. W. R. Frink sent from the Island of Kauai, of the Hawaiian group, to the California Academy of Sciences, a bottle of sand which possessed some peculiar qualities. A sand drift exists there some 60 feet high, and by taking two handfuls of this sand and slapping it together a sound is produced like the low hooting of an owl—more or less sharp as the motion is quick or slow. At the time of the receipt of this sand we gave a description of its peculiarities as detailed in a letter accompanying the gift. Mr. Frink said:

Sit down upon the sand and give one hand a quick circular motion, and the sound is like the heavy bass of a melodeon. Kneel upon the steep incline, extend the two hands and clasp as much sand as possible, slide rapidly down, carrying all the sand you can, and the sound accumulates as you descend until it is like distant thunder. In this experiment the sound was sufficient to frighten our horses fastened a short distance from the base of the drift. But the greatest sound we produced was by having one native lie upon his belly and another taking him by the feet and dragging him rapidly down the incline, carrying as much sand as possible with them. With this experiment the sound was terrific, and could have been heard many hundred yards distant. With all the experiments that were made, it seemed the sound was in proportion to the amount of sand put in motion with a proportionate velocity.

In order to ascertain if possible the cause of the sound produced by this sand, Dr. James Blake has investigated its structure under the microscope, and at the last meeting of the Academy of Sciences he stated that the facts he has ascertained fully explain the manner in which the sound is emitted. As the grains of sand, though small, are quite opaque, it was necessary to prepare them so that they should be sufficiently transparent to render their structure visible. This was done by fastening them to a glass slide and grinding them down until one flat surface was obtained. This surface was then attached to another slide and the original slide being removed the sand was again ground down until sufficiently transparent. The grains were found to be chiefly composed of small portions of coral, and apparently calcareous sponges, and presented under the microscope a most interesting object. They were all more or less perforated with small holes, in some instances forming tubes, but mostly terminating in blind cavities which were frequently enlarged in the interior of the grains, communicating with the surface by a small opening. Several specimens of what appeared to be minute bivalve shells were also met with. Besides the elements derived evidently from living beings, these sands contained small black particles which the microscope showed to be formed principally of crystals of augite, nepheline and magnetic oxide of iron, imbedded in a glossy matrix. These were undoubtedly volcanic sand.

It would be impossible to give more than a general idea of the appearance of this sand under the microscope, except with elaborate drawings. The structure of the grains, Dr. Blake thinks, fully explains the reason why sounds are emitted when they are set in motion. The friction against each other causes vibrations in their substance, and consequently in the sides of the cavities they contain, and these vibrations being communicated to the air in the cavities, under the most favorable conditions for producing sound, the result is the loud noise which is caused when any large mass of sand is set in motion. There are, in fact, millions upon millions of resonant cavities, each giving out a sound which may well swell up to resemble a peal of thunder, with which it has been compared, and the comparison, Dr. Blake knows from those who have heard it, is not exaggerated. The effect of rain or dampness in preventing this sound is owing to the cavities in the sand becoming filled with water and thus rendered incapable of originating vibrations. The chemical composition of the sand, with the exception of the volcanic grains, is calcareous, being completely dissolved by chlorohydric acid, although it is probable that some of the *speculae* in the sponges are siliceous.

THE Blue Ditch mining company are now engaged in building a ditch from a point on the South Yuba river, a little below where the South Yuba Canal company's ditch commences, for the purpose of running water to their mine, situated at Blue Tent. They have 75 men employed on the works. They have completed about three miles of flume, which is of the most substantial character. The ditch will have a capacity of running about 700 inches of water.

SIR WILLIAM FAIRBURN, the eminent engineer, is dead. He was one of the founders and first members of the British Association for the advancement of science. He was also the author of many standard books upon iron, among which are "Iron, Its History and Manufacture;" "Application of Iron to Building Purposes," and "Iron Shipbuilding."

THE American quicksilver mine is situated on Pine mountain, seven miles from Middletown, and three from Pine Flat. The company have started their new works, and have four benches of retorts. They are crushing the rock with a 10-stamp mill, grinding it as fine as powder, in accordance with a new process.

The Blue Jacket Mine.

An incorporation was formed in this city this week under the name of the Blue Jacket Gold and Silver Mining Company. The mine is located in the Bull Run district, Elko county, Nevada. A ten-stamp mill has been ordered for this mine, with pans, settlers, etc., all complete. The contract price for the mill is $30,000, and Mr. Hitchcock, the well-known millwright, will put it up. He will build a lumber mill near the mine to facilitate his work.

The proprietors of this mine intend working it in good earnest; and no stock will be put in the market. Mr. T. H. Blythe, a resident of this city, puts up the mill, etc., for a half interest in the mine; and although the arrangements were only consummated last week, every preparation is being made to go to work on the property in a genuine manner. A fine engine goes with the mill, which is arranged to run either by steam or water power. A water privilege is connected with the mine; so, if desirable, they will use water power instead of steam. A wire tramway has been ordered from A. S. Hallidie, of this city, by means of which the ore can be brought from the mine to the mill at a nominal cost. This tramway is about half a mile long, and has a descending grade of about fifteen degrees from the mine to the mill.

This mine was examined and reported on by Mr. J. S. Phillips, M.E., of this city, author of the "Explorers', Miners' and Metallurgists' Companion," a standard work on mining. The mill will be put up by Mr. Blythe for half the mine, on Mr. Phillips' recommendation. It speaks well for the mine that Mr. Phillips has reported on it favorably, for he has condemned many other mines in which as well as other sections of the country. In fact many people suppose that this gentleman is rather too fastidious in his choice of mining property, since through his agency several promising sales have fallen through. Mr. Phillips (who is a pre-eminently practical man) has been appointed general executive manager of the property and is now superintending the construction of the machinery. This will, however, require only one-third of his time, and his general business will be conducted at San Francisco, as heretofore.

There is a tunnel some 300 feet long in the mine and two winzes have been sunk in it for prospecting purposes. The ledge is from four to 18 feet in width. It is splendid looking quartz in a very healthy formation. There are now over 400 tons of ore in the dump, which will mill about $60 per ton in gold and silver. Mr. Phillips was the first one to speak favorably of the Great Western quicksilver mine of all those who examined it, and it is now turning out in a manner to justify his opinion. This one is the first instance, however, that we know of, that he has approved of a mine in Nevada, although he has examined quite a number, and it speaks well for the mine that his report is so favorable.

Take the Boys Around.

Parents should not neglect the opportunity which a Fair like the present affords of pleasantly interesting children in mechanical contrivances. A multitude of machines are here shown in operation, with the advantage of being removed from all dust, in their usual working, makes them disagreeable to visit. The grime of the factory is left behind, while the machine puts its best foot foremost, and has the virtue of working quite as faithfully on its holiday as at any other time.

It is very easy to get boys into an inquiring frame of mind, by sauntering with them among the objects on exhibition, and exhibitors are, of course, only too glad to answer questions. The deplorable ignorance of the simplest mechanical laws by the disclosed queries of otherwise well educated men, shows how grossly this important branch of knowledge is generally neglected. California is destined to be among the manufacturing States, and the value that a knowledge of machinery will be to an ambitious young man, cannot be easily exaggerated. We hope, therefore, that fathers, even at the loss of leisure and inclination, will devote an occasional hour or two, showing the youngsters around among the machines. It may awaken an interest that will add much to the pleasure and profit of the lives of their sons.

COLUMBIA HILL, a mining town in Nevada county, located on the "ridge," between North San Juan and North Bloomfield, has a gravel bed for its foundation. The miners have sluiced up to the back yards of houses on both sides of the main street, taking out large amounts of gold, and are anxious to wash the town entirely away; but to this property holders object. The time, however, will probably come when not a vestige will remain of the slope now built over with houses.

PHILIP ARNOLD, of "Arizona diamond" fame, has been arrested in Kentucky on a requisition from the Governor of this State, and is now on his way to this city, where he will be tried for conspiracy to cheat.

THE miners at Fairplay, Colorado, threaten to commence hanging if there is any more stealing of ore in that neighborhood.

Address of the President of the Mechanics' Institute.

The following interesting remarks were made by Mr. A. S. Halliday, President of the Mechanics' Institute, at the opening of the Ninth Industrial Exhibition, on Tuesday last:

To-day we are assembled to inaugurate the ninth industrial exhibition held under the auspices of the Mechanics' Institute—an exhibition which will tell its tale of progress and demonstrate the condition of art, industry and science on this western outpost of our common country. We must feel grateful for what we find good, rejoice in what we see is better, and resolve, in the future, to push onward in the cause of progress in civilization and humanity among men; raise the moral worth of our people, and set to other communities an example of industry and sobriety.

This vast structure to be dedicated to the cause of Industry, Art and Science by the gifted speaker who will address you this morning, is tangible evidence of the direction of public sentiment, and of the forces that emanate from that sentiment.

It was the general wish that an Industrial Fair should be held in this city during the present year. The thinking part of the community said these exhibitions are good for the public weal; they are public benefactions; they possess no downward tendencies; they better mankind by disseminating the facts of results produced, and suggesting fresher and newer ideas that press onward towards perfection, expressing the thoughts of genius through the mechanical contrivances of man, and enabling neighbors and commercial friends to catch from the inspiration of the surroundings an appreciation of our efforts, ultimately developing intolerations of amity and commerce.

MINING WITH A ROCKER.

And, from the social standpoint, these exhibitions are equally a necessity. Elsewhere, in more favored summer climates, the parks, the public walks out of doors offer opportunities for public gatherings; here in San Francisco the driving wind and damp fogs from the ocean prohibit out-door amusements. Even before fireworks were driven from the Fourth of July order of exercises, the proscriptive point of pyrotechnic enjoyment was to calculate the exact moment of disappearance in the fog of the ascending sky-rocket, and to get out of the way of the descending stick. Under this canopy of serpentry, this structure dedicated to the mechanic arts, the people of this city can gather, protected from exposure to our sea fogs and summer winds, and enjoy the music from a well-trained orchestra of excellent musicians, wander through avenues flanked by specimens of industry and art, or stroll in the quiet of the art galleries among efforts in the department of the higher arts.

Seventeen years ago San Francisco held its first Industrial Fair. A plain, simple pavilion, whose total dimensions were less than to-day is set apart for, and occupied by, the fine art department of this exhibition. James Lick generously gave the use of the land it then occupied, now covered by the Lick House. Then the whole interest of this State was centered in its mines. A few specimens of wheat were exhibited by some visionary exhibitors, who thought that certain portions of California might, with proper care and irrigation, raise grain. The immense valleys of the Sacramento and the San Joaquin, and all the lesser valleys, were known then as now, but the imagination of the wildest of these visionary exhibitors could not have pictured a yield in 1874 of 31 million bushels of wheat, or a surplus for exportation of 700,000 tons, giving employment to two ships of 1,000 tons each per day, the year round, to carry off the surplus crop.

But doubtless you will find in this exhibition other exhibitors equally as visionary, who seventeen years hence will find their visions of to-day as a star in the firmament of realization.

Who would have prophesied seventeen years ago that a structure like this would have been erected in this spot? Or still less could he have foretold the contributions to the solid wealth and prosperity of this State that are now gathered together under this roof.

Every branch of industry has been steadily growing, while new ones are being developed. These Fairs mark the line of the advance, and the report of the Managers sticks in the pin that notes the line of high tide.

Not only have the Mechanic Arts advanced in their industrial aspect, but they have received a substantial impetus in the scientific aspect, from the aid extended by institutions of learning in this State, and in a general way by the sympathy and financial help of many of those who are able to give.

The origination of the evening drawing classes in the public schools; the munificent donations of Mr. Lick to found a Mechanical School; the steady growth and prosperity and usefulness of the Mechanics' Institute Library; Mr. Lick's gift to the same; the special efforts of the Regents of the University in organizing the department of the Mechanic Arts, which although slow is sure, and the general tone of public sentiment, all demonstrate the recognition of the value of the Mechanic Arts.

Almost every branch of industry is now carried on in this city, and adjoining countries are looking to California for their supplies of manufactures and of commerce. A community to be great must be independent, and to be independent must have resources within itself; thus, we must produce and manufacture. To do this needs industry and knowledge; drones and idlers are drags on the wheels of progress and should not be tolerated, and every man is bound to earn at least what he eats and wears.

It seems strange, indeed, this cry of deep depravity that comes up from the lips of so many of the youths of San Francisco when we consider the forty or fifty millions of dollars in the savings banks of this city; the 53,000 persons who attend the 65 churches each Sunday; the $150,000 annually paid ministers; the $3,200,000 it costs to run the city government. There is no consolation in those figures, but there is consolation to anyone who has taken the trouble to inquire, in the fact that the boys of San Francisco are better than their reputation. I, for one, will stand by the boys. I was a boy here myself twenty-two years ago, and now, as a man, deprecate this unreasonable, wholesale denunciation of the boys of San Francisco, who, when we pass away, will act their part in the drama of life. In the meantime I trust they will come here, they will find much to study, and encouragement in what they see around them, and let those who have chosen a trade feel a pride in the products of the artisan and try and emulate the best thoughts he sees produced in mechanical results, remembering that the possessor of that trade is a reserve capital that can never be exhausted; and although he may not be called upon to practice that trade, it is a good thing to have; it will serve *him* a good turn as it has me, if he has occasion to use it; with *that*, a fair amount of intelligence, perseverance and industry, you are no man's slave, but an independent, free man.

The one hundredth anniversary of the birth of this nation will recognize the dignity of industrial pursuit in the broadest sense. In what way could such a nation as this better celebrate its centennial? A military power might call out its soldiery, in martial splendor, and show to the world by the pomp, magnificence and numerical strength of its display, the stability of its government by the power of its army. But in the United States, when the nation or its honor has to be defended; every citizen is a loyal soldier, and the calling of such an army together would be as impossible as the nation's good sense would deem the act unworthy; but, rather we prefer to show the world what we have done in the arts of peace, what the country is capable of producing, and to what industry, art and education have brought to the people of the land.

You are making the manufacturers and producers of the Old World tremble; your skilled mechanics have attacked them in their strongholds and taken their forts by surprise. No longer is an American mechanic treated with contempt; he is sure of respect; and I am a poor prophet indeed if I cannot foretell for your centennial in Philadelphia a glorious achievement by a bloodless victory that will bring all Europe and Asia to your manufacturers' and mechanics' feet.

Surely the petty jealousies and bickerings about the Centennial Exposition are unworthy a great people. An impartial jury determined that Philadelphia was the proper place to hold it; and where could it more appropriately be located than in the city where the Declaration of Independence was first proclaimed?—the venerable old Independence Hall still remaining to attest the part it took in the struggle for manhood. Historically, there is no reason why it should not be there. Logically, there is every reason why it should. Boston, New York, Washington, and I may add even San Francisco, agree that next to itself Philadelphia is the best place.

California has not much occasion to feel proud of the position she has taken; her quota of subscription all told was but $145,000. She has subscribed the pittance of $2,000. Her last legislature refused to aid the celebration and to-day, California, the freshest, brightest, richest, most generous State in the Union, stands in stolid indifference; while Oregon, up north, has subscribed the whole of her quota and proposes to do still more when the proper time comes. Mechanics of California step forward and show to the people of this Union that you appreciate the centennial by your acts, your sympathy and pecuniary aid; and when, in 1876, the grand gathering of the industries of the country occur to celebrate the achievements of our mechanics, and to the $60,000 loaned to the managers by the open-hearted men of San Francisco.

For the design of this building we are indebted to Mr. David Farquharson. It speaks for itself, and has louder lips of praise than I can command.

We owe the construction of the building to Mr. Jonas Drury, who did his work faithfully, as an honest mechanic, and expeditiously as a man who values his work and time.

The managers have departed this year from the usual custom of awarding premiums, and this has been done at the request of some of the principal exhibitors. It is believed that the exhibitors will reap all the benefits of the Fair, and avoid the dissatisfaction and the disappointment the majority must experience, by failing to obtain premiums.

The only exceptions to the above rule has been in the case of the pupils of the public drawing schools, and apprentices, to whom the trustees of the Mechanics' Institute propose to award premiums, if they compete.

The San Francisco Art Association has taken charge of the department of fine arts, and whatever there may be of more than ordinary excellence in material and arrangement, is due to that society, and the same may be said in respect to the horticultural department, which is managed by the Bay District Horticultural Society.

The managers do not expect the exhibition will be as perfect in its detail as those which will follow. The work of raising financial means, of obtaining a suitable site for a building, and of constructing the building, have taken much of the time and attention of the managers.

The exhibition will probably continue for five or six weeks, and each week will add to its interest and perfection. The managers have never failed to keep faith with the public as to the day and hour of opening. Exhibitors are not so punctual, as the many bare spots can verify; but every available foot of exhibiting space has been engaged for some time, and a few days will radically change the appearance of the hall. There will be much to delight and instruct; and, while the Mechanics' Institute most heartily bids you welcome, it trusts that the exhibition may end as pleasantly as it has begun, and enable the managers to stick another pin at the high water line of industrial progress.

As the last strains of the "Hallelujah Chorus" died away in the distant echoes of the colossal structure, the audience, on the point of moving toward the doors, were startled by a tremendous clangor of bells, which in their boisterous language told that the Ninth Industrial Fair was inaugurated.

Mining with a Rocker.

Our illustration represents a mining scene in "early days." One Chinaman is in the diggings, two are packing dirt, and another is running the rocker, while the white man—boss of the crowd—is cleaning up. In rich diggings in the early days of California mining, fortunes were often made with a simple rocker, and the miner's stock in trade was small and comparatively cheap. Gravel diggings are now always worked on a larger scale, and it takes some money to fit out a claim to work it properly. Rockers are very little used in our mining regions at present, except by Chinamen, or by white men in diggings where the dirt is rich and water scarce. It does not take much skill, or knowledge of mining matters to "superintend" a rocker, and many a farmer or mechanic undertook the job in early days at a minute's notice; in fact with as little hesitation as a lawyer, doctor or storekeeper takes charge of a quartz mill now-a-days for an incorporated company. Under these circumstances, however, almost any one rocker has turned out to be a more profitable investment than all the quartz mills put together.

About 70 men are employed in the Guadaloupe quicksilver mines of Santa Clara county. The new shaft is now 230 feet deep, but no new vein has been discovered.

A correspondent says there is a great stir at Mauchester, Mendocino county, over the discovery of a ledge there which has assayed $10 gold and $3 silver to the ton.

James Crawford, of Lyon county, Nevada, has been appointed superintendent of the Carson Mint, vice Hetrich resigned.

A "Growing" Evil.

The natural history of the hoodlum is receiving at the present time a large share of the attention of the press. Outside of newspaperdom, however, there are points and phases of the subject discussed which may never find their way into print.

It is declared in these retired gronps that nnfairness has been manifested in the nttempt to depict hoodlnmism as it exists; and also in the endeavor to localize it too exclnsively in San Francisco. Some declare that "the boy of the period" is no worse a character than was the father in his youthful days—or, possibly, worse than the father is at the present day; and we think candor will prompt the man who has left his own boyhood 40 years behind on the road of life, to confess that the hoodlum of to-day is no worse a character than the "bad boy" of his day, or the "rowdy" of 15 years ago. The prevalent habit of contrasting the youth of *our* period with those of "*the* period," over-painting the merits of the former and the vices of the latter, is nnjast; and no good can come of it.

It is equally nnfair to "shonlder" hoodlumism exclnsively npon San Francisco. We do not dispnte the claims of this city to having originated the name by which this class is known; bnt the condition of hoodlnmism has been recognized in the cities of the East as far back as the history of boys can be traced. If the press of San Francisco wonld hurl back a few of the stones that have been thrown at ns from other cities, we should find that many of our neighbors are living in glass houses. Hoodlumism is also rampsnt in our mining camps and in our agricnltural villages and settlements, idling away the day and making the night hideons with their caronsals.

But we are not at present disposed to visit our neighbors for the pnrpose of writing "sloven" npon their dnst-covered fnrniture. It is apparent that we have qnite enongh tn do to put our own honse in order. It mnst be confessed that there are some pecnliarities of San Francisco life that are particnlarly favorable to the growth of hoodlnmism. We will only point ont one here; and this is more of a necessity than a fault. It is the habit that keeps the men so mnch of their time from their homes. We hear a good deal abont woman being "the angel in the honse;" bnt man's presence is qnite as essential to the pnrity of home as is that of woman. When he takes his lunch away from home, departing in the morning and retnrning at night, he becomes, in a degree, alienated from home; and the woman and children of the household have an excess of spare time and too mnch liberty. If the mother were in the habit of spending her spare time at patch-work, knitting, or any fancy work, as in former years, there wonld be less danger of mis apending some of the many hours between morning and evening; bnt as it is she has only to send her children forth into the atreet—the school of hoodlnmism—and she is nnencnmbered with labor, care and responsibility, and has time to fit herself for her position as the maternal gnide of the growing hoodlnm.

There is no panacea by which this social ailing can be cured. It is, at the heat, chronic; possibly organic. Probably a thorongh diagnosis of the case wonld jnstify ns in declaring that hoodlumism is in reality only a symptom of the disease of the social body. This is not a pleasant pictnre to contemplate. But is it not correct? And will it do any good to burn these evils in effigy?

Watea Locomotive.—This ia a startling and apparently absnrd idea, hnt a French civil engineer, M. A Hnet, advocates its possibility most strennonsly, and, what is more, backs up his theory with most recondite and laborious mathematical demonstration. One may however, prove almost anything by figures, so that any amonnt of theoretical demonstration does not advance it materially to practical accomplishment. The idea is, briefly, that it is a mistake for ahipa to have to force their bulk *through* the water, meeting thereby the large opposing surface of water and a sliding friction over the whole of their immersed snrface. This, M. Huet holds, is as great a mistake as if we were to diamonnt our railway carriagea from their wheels and drag them, like sledges, along the rails. He boldly puts forth the theory that vessels should be' mounted on rolling drnms, th it these drums shonld give principally the power of floatation, and that they should be driven rannd aa paddles to move the ehip forward. We shonld in this way have a floating locomotive mounted on its supporting wheels or rollers. The vessel wonld offer no resistance hnt a rolling one, to motion, and the whole of the snpported weight of the ship wonld he nsed as useful pressnre to give adhesive frictional effect to the rollers. In this way M. Hnet affirms that a velocity eqnal to our trains might he attained at sea. Thie is certainly a prodigions leap in advance. We have hy no means reached our limit of invention yet, at any rate.

Many patents have been issned for variona devices intended to provide a cigar-box wbich ahall serve to exhibit the cigars without breaking the revenne-stamp, and to provide a faatening device which, applied to the nuder section of the cover, and having posted over it the revenue-stamp, prevents the opening of the hox sufficiently to remove the cigars without destroying the stamp.

A Perilous Position.

Yesterday afternoon, abont 11 o'clock, Sam Jones, brother of Senator J. P. Jonea and superintendent of the Crown Point mine, in company with George Williams, station tender and Mr. Chase, nnderground foreman, had a narrow escape from death while ascending the main shaft of the Savage mine The three men got on the cage at the 1,300-ft. level, which ia the bottom of the perpendicular shaft. They had with them some specimens of rock, which they laid npon the cage, and lanterna which they carried in their hands. They placed themselves in the cage, and taking hold of the bell-rope, struck three bells, which being interpreted means—"Hoist, with men." Obedient to the signal struck on his bell above, the engineer began hoisting the cage. All went well until the cage had ascended sbont 400 feet, when it snddenly jnmped ont of the guidea and was loose in tbe shaft. It was dashed from side to side with such violence that the lanterna were knocked ont of the hands of the men, their specimens were thrown from the cage, and they mnst all have been shaken off but for the peculiar construction of the cage, which has cross-bars at each end which may be grasped. Up they went, hanging from side to side, Mr. Chase trying all the time to seize the hell-rope and strike the signal for stopping the cage. This rope is in a corner of the shaft, but when Mr. Chase did occasionally get hold of it, he was unable to make the signal, owing to the rapid and irregular manner in which thoy were ascending.

Thns they were dragged np the ahaft for a distance of over 300 feet, expecting every moment that the cage wonld catch on some projection in the shaft, the cable be broken, and the cage and themselves precipitated to the bottom of the shaft, which wonld have been instant death. Finding they could not signal the surface by means of the bell-rope, they began yelling "Stop the cage! Stop the cage!" in the vain hope that they might be heard above. Sam says he "yelled like a horse-thief." All their yelling was of no avail, however, as not a whisper was heard on the surface. The banging about of the csge cansed the heavy iron cable to be swayed violently, and this was at last observed by the carman nt the surface, who called the attention of the engineer to it, and had him stop hoisting, it being apparent that something was wrong. By means of the ladders a man from the surface then climbed down the shaft, and ascertaioing the sitnstion of the men on the cago, returned and had a cage sent down another compsrtment to their relief. The three men were kept snspended on the cage for over an honr before they finally got ont of their perilons position. Even after the cage had stopped they were not safe. They feared every moment that some of the men at the bottom of the shaft wonld ring the bell and start them either np or down the shaft. To prevent this, one of the men got hold of the bell-rope, and winding it two or three times ronnd his hand, thns held it till the relief cage reached tbem. When they finally reached the anrface it is said that all three of the men looked like the laat rnn of shad. They were drenched with water and covered with mnd. Chase had a cat in hia head, and Sam Jones had his left ahonlder badly hrniaed from his being jammed against the croas-bar of the cage. Sam saya a single, nnexpected jar in a cage snfficiently frightens almoat any man, hut to be dragged and hanged to and fro for a distance of 300 feet is simply terrific.—*Enterprise.*

Our Great Hotel.—The contracts for furnishing material for the bnilding of the Palace Hotel keep sixteen brickyards in active operation, and furnish large orders for three granite qnarries, four boiler manufactoriea, three fonndries, the rolling milla in this city and a gas and watar pipe manufactory in Philadelphia. They also fnrniah large orders for plaster from the New York plaster works; for cement from kilns in New York and in England; for marble and alate tile from the qnarriee of Vermont—16,500 eqnare feet of marble and 12,500 square feet of slah; for 685,000 sheets of plate glass from England, and 8,700 donble-thickness aheeta of glass from France, and for 340 bath-tnbs from a mannfactory in New York. Among the other orders to be filled is one for 350,000 feet of yellow-pine from Georgia, another for teak and camphor wood for closeta and floora from India; for white mahogany from Mexico, for floors and wood finish; Tomano wood for finish, and yellow fir, oak and aah from Oregon.

New Boiler.—Mr. N. D. Harvey, of New Orleans, has bronght out a novel steam-hoiler in which the sides of the firefloe, the back of the bridge wall, or the back ends of the boilers, are jacketed, and the mnd drum connected therewith. In this arrangement the feed water is pnmped into the jacket, and not directly into the hoiler. Before the feed-water enters the boiler it is heated to the boiling temperatnre, and the sediment is deposited in the jacket, and readily finds its way to the mnd drum, to be blown off. Conseqnently the water in the hoiler is kept comparatively pnre.

A rich qnartz ledge has been fonnd on the farm of Lyman Woodrnff, two milea from Ellensburg, month of Rogoe river, Oregon. In many placea inside of his inclosure croppings of gold have been found. It is in cement. Mr. Woodruff took ten ponnds of the rock or cement and pounded it np, and from it got $13.50

Newly Discovered Mines in Nevada.

The Elko *Independent*, of August 8th pnblishes the following concerning the newly discovered placer mines seventy-five miles north of that place: A party of citizens, consisting of H. W. Brown, W. T. Smith, R. Crozier, G. S. Holbrook, Mr. Ritchie and others, left this place for the mines some two weeks ago on Wednesday last, accompanied by J. R. Norton, one of the pioneers of the new camp, and report the diggings eqnal to the best that have been struck on the coast since California's palmy days. From Mr. Brown, who has had large experience in placer mining in California and elsewhere on the coast, and is, moreover, a thoroughly reliable gentleman, we obtain the following in relation to the mines and the route leading to them. The mines are situated seventy-five miles north from this place, in an immense basin in the mountains near the old Bronco mining camp, with a good wagon road the entire distance. The stage road to Cope is followed to the crossing of the Owyhee, at which point the road diverges to the right, reaching the mines in eight miles. Mr. Brown informs us that he prospected down Hope Gulch—which is thns far the principal one—Penrod creek, and the Owyhee, a distance of ten miles, and found gold in greater or less quantities at every point along the route. Subsequently he negotiated with Hazeman and Southwic, and succeeded in purchasing a half interest in their claim in Hope Gnlch, from five pans of the earth, of which he took 75 cents in dust. He also showed us some rich nuggets that he had panned out dnring his stay. Prior to the purchase by Brown, Hazemnn & Southwic had taken from an opening twenty feet sqnare in their claim $127. Norton & Kidd took from their claim in two days with their own hands, two and one-half onnces of dust. Mr. Norton also states that there are in the gulch ten claims that pay as high as one ounce per day to the man by sluicing, and that, too, with a very limited snpply of water. All the gold bronght to this place is very pnre, running from $19 to $19.25 per onnce. We learn that parties on the other side of the monntain, immediately opposite Hope Gnlch, are also working ground snccessfnlly. The Owyhee company made a run of ten days with two hands, and cleaned up $400; bnt, owing to the scarcity of water, work on the gulch has been temporarily suspended, and the Minnesota company—to whom the Owyhee sold out—is now snrveying for a ditch to bring from a distance of ten miles the watera of a stream that will afford an abundance to work the whole gnlch. Just below Norton'a claim John French has run a tunnel into the hill about 40 feet, and fonnd good prospects all the way from the snrface, the dirt yielding from one cent. to one dollar to the pan. The general impression seems to be that the diggings are extensive, and that diligent prospecting will make still more wonderful discoveries in that section. The opinion has been expressed by several experienced placer miners who have visited the new strike that with plenty of water an average of an onnce per day to the man can be realized, as prospects throngh Hope Gnlch rnn from 15 to 75 cents per pan. The distance is so trifling, and the startling reports come so well anthenticated, that nn intense excitement has been prodnced here, and parties are ontfitting and striking ont for the new El Dorado in hot haste. We have every reason to believe the diggings fully as rich as reported, and, should they prove as extensive as they are rich, "the days of old, the days nf gold, the days of '49," will be revived in Nevada.

Black Diamond Coal Mine.

This mine, which is attracting considerable attention in this neighborhood, is situated in the Palmyra district and abont 17 miles from Dayton hy wagon road. The owners are Messrs. Emmett, Edwards and Day, of Lower Gold Hill. At the snrface the seam, on the side hill, was only abont one inch or less, and the owners decided to tnnnel an incline below it, which they did with the most satisfactory results. Upon intersecting the vein, it was fonnd to he nearly three feet in width, and to yield a qnality of coal similar in appearance to Scotch and New Zealand cannel coal, specimens of which, together with a sample of the Black Diamond, can be fonnd at the office of the Gold Hill foundry by those desirons of comparing them. The engines at the fonndry were rnn a portion of yesterday and this afternoon by steam generated by the nse of the coal, and it was found to be equal to Rocky Mountain coal, which the proprietors have been in the habit of nsing. From the close resemblance that the Black Diamond bears to the New Zealaod coal, it is expected that for making gas, it will answer the pnrpose mnch better than other coal now in nse in this State. On account of meeting with considerable water in the incline, no work is being done at present, hut the owners will shortly devise means to rid themselves of this element and coutinue the work of sinking on the seam. Although the mine is sitnated 17 miles from Dayton, as soon as the claim is a little more developed, a road will most likely be built that will shorten the distance to shipping points considerably. There is no stock for sale (it not being an incorporated company), and the owners desire that no exaggerated reports be pnblished concerning the mine. They intend to take things easy, create no excitement whatever, bnt to await developmenta.—*Gold Hill News.*

The Maxwell Ditch and Mining Company.

We paid a visit on Wednesday last to the extensive works of the Maxwell Ditch and Mining Company, on Spanish creek, six miles from this place, and found the company "hard at it," and in high spirits. Work was commenced on this enterprise in September, 1872. The water is taken from the creek, at what is known as "The Falls," npwards of a mile above the Spanish creek bridge. The hulkhead is composed of massive timbers, bedded into the solid rock, and weighted down with hnndreds of tons of honlders, and so constrncted as to stand an enormous strain in flood seasons. The flume, five feet wide and about the same depth, is 900 feet in length from the head to where the water enters the ditch, and was an expensive piece of work, as in many places large points of rock had to be blasted ont of the way to make room for the foundation, and in others it is npheld by framed timbers, 30 or 40 feet in hight. Lumber and timbers for the flume were "shot" down the almost perpendicular face of the mountain, over a quarter of a mile. After overcoming these difficulties, the ditching was comparatively easy, although some hard bed-rock was enconntered, and occasionally a sectioo of flume had to be constructed aronnd a cliff of rocks.

The ditch is three feet wide on the bottom, three feet deep in solid ground, and carries 2,000 inches of water. At the crossing of Blackhawk creek the water is led into a section of 27-inch iron pipe, 420 feet long, and having a depression and elevatinn of 75 feet This pipe has been put in dnriog the past winter, and works "to a charm." About half a mile below the crossing of Blackhawk the company have two gisnts at work, making an opening in the gravel, and have some good prospects. They have grounds enongh at this point for a long run, and will, we are satisfied, make it very profitable. We consider this one of the permanent mining operations of Plumas county. The water privilege is the best one we know of, lasting, as it does, tho whole season. The ditch will probably be extended down the river as fast as required, and it is well known that numberless bars and gravel beds, under the ditch line, will pay handsomely for working in this way. The company have labored under many disadvantages heretofore, but are now fsirly at work, with a certainty of being richly rewarded.

To Capt. H. W. Berry, and other members of the company, we are under obligations for their kindness in showing us over the ground. They are hard working, practical miners, and we wish them the best success in their undertaking.—*Plumas National.*

Signalling to the Driven in Vehicles.—Some one has patented an apparatns which consists of a hollow ball disposed inside the cab having a whistle attached thereto which is placed in close proximity to the driver. The ball is secured in a disc of wood or other material on which are inscribed directions for using the apparatns. Thus, on the occupant of the vehicle compressing the ball, the whistle will he caused to soond one or more times, according as he wishes the driver to stop, go on, turn to the left, turn to the right, etc.

Self-feeding Copying Brush.—Those who make a practice of keeping letter-books will be interested in learning that these is now made a brush with a hollow handle attached containing water, which is forced down to the brush by means of air pressnre admitted throngh a case fixed in the top of the handle; the object being to facilitate the operation of copying letters hy the ordinary copying books, and dispensing with the usnal separate water-well or like receptacle—water tube and brush being combined by this invention in one and the same article.

Salt in Nevada.—Concerning the salt mines of Nevada, the Reno *Journal* says: "Ninety miles northeast of Reno is the region of the immense salt fields of Frank Murphy, capable of producing salt enough to supply the whole world with that nseful and indispensable article. This salt is of the very best and finest quality—superior in every respect to the best Liverpool. For several years past Mr. Murphy has supplied the entire demand in the counties of Lassen, Plumas and Modoo, California, and much of western Nevada."

The Ne Plus Ultra copper mining company, in Fresno county, last week shipped twenty tons of ore. At the present rates of freight only the highest grade of ore can be shipped, and, therefore, the mine cannot be worked to much advantage. If freights were reduced to a dollar a ton it would enable the company to ship three times the amonnt of ore they now ship, at least, and would make the mine pay handsomely.

The Visalia Branch Railroad.—The Visalia railroad, connecting Visalia with Goshen Depot, on the San Joaqnin valley railroad, was completed into Visalia on the evening of the 14th instant. A salnte of 100 guns was fired as the last rail was laid. The road is seven miles long, and is built and owned by the citizens of Visalia. Ground was broken July 4th, and the work commenced July 10th.

A ditch will be constructed this summer, for the purpose of bringing water from Rock creek to Green Mountain gravel claim, owned by Wm. Manson and others, of Downieville.

Encourage the Prospectors.

The Grass Valley *Union* throws out the following hints as encouragement for miners to persevere in their labors of prospecting. As some of the hints have a general application we copy the item for the benefit of our mining readers generally:

"The Seven-thirty mine is still sending good rock to the surface and to rejoice the hearts of Robert McCook, David McCook and E. P. Sanford, the owners. That mine is working itself and is paying dividends all the time. The same owners have the Pittsburg mine—which is not far off from the Seven-thirty. The Pittsburg will be sending out rock in the course of a few days. Last year the Pittsburg contributed a goodly quantity of gold to the revenue of the three owners, and in a week or so it will be doing the same thing again. These mines prove that prospecting pays. These mines have been worked in spite of the predictions which the growlers made against them. Had the idlers been listened to the McCook Brothers & Sanford would have had no mines to this day. Hundreds of merchants and business men here can get good mines by putting up a little money, a small sum each month, for prospecting purposes. This town and every inch of property in it and every business interest in it, depend on mining. Mining is the bed rock on which rests all the prosperity of Grass Valley. The men who own brick houses, frame houses, town lots, or who do business in any way must look at last to the mining interest for their living. That being the case each man in business should be ready to help, so far as he can, to prospect the district. The adage to strike while the iron is hot will do in flush times, but make the iron hot now for striking purposes is the better rule for the dull days."

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents, two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

Ninth Industrial Exhibition

HELD UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE,

WILL OPEN TO THE PUBLIC

TUESDAY, AUGUST 18, 1874, at 11 A. M.,

Corner of Eighth and Mission Streets.

The OPENING ADDRESS will be delivered by

COL. W. H. L. BARNES.

The Musical Exercises will be under the immediate direction of Professor OEO. T. EVANS, assisted by Prof. W. Elliot.

The Art Department will be under the arrangement of the S. F. Art Association.

The Horticultural Department will be under the charge of the Bay District Horticultural Society, and will be one of the pleasing features of the exhibition.

PRICES OF ADMISSION:

Season tickets, admitting gentleman and one lady..$5 00
Season tickets, admitting one person..... 3 00
Season tickets, admitting juveniles under 14 years 1 50
☞ The above tickets are not transferable.
Single admission..... 50 cents.
Children under 14 years..... 25 "

Tickets can be obtained from any of the Managers, at the Mechanics' Institute, 27 Post street, and at the principal music and drug stores.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of those same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

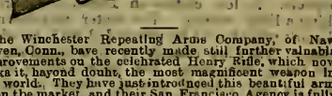
THE NEW WINCHESTER

REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.



The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Carriage for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

JOHN SKINKER,

PURCHASERS please say advertised in Rural Press.

[Continued from Page 117.]

condition, and it is expected the wster will soon be drained snfficiently to permit of the resnmption of work in the mine.

Buckeye.—The north drift at the third station is in 198 ft., the face in quartz, with streaks and spots of fine ore. The sonth drift at the second station is in 23 ft., running the entire distance throngh milling ore.

New York.—The principal west drift of the 580-ft. level is making good headway, the face in hard rock, full of small seams of lively looking qnartz.

Savage.—Sinking the main incline is making steady hesdway. Cross-cntting on the 2,000-ft. level has developed nothing new dnring the week.

Sutro Tunnel.—Tolal length from mouth to fsce of main header, 6,507 ft. Better progress is now heing made than heretofore, ss two more Bnrleigh drills sre set to work. A small stream of wster is coming in at the face of the header, hut not enough to interfere with the work.

Arizona.

HASSAYAMPA DISTRICT.

Hurrah for the Hassayampa.—*Miner*, Ang. 8: This good old mining district, the highest, in altitude, of all Arizona mining districts, is now rewarding its workers well, as we learned yesterdsy afternoon from S. O. Frederick, who walked into our sanctnm and permitted ns to look at four very large pieces of gold, which he hsd just hronght to town from his quartz crnshing works, Hassayamps district, ahont eight miles south of Prescott. The pieces resemhled the soles of an old shoe, that is, in shape. He hsd not weighed them, hut guessed that they wonld bring him something like $3,000. Since then we have received a note from Mr. J. Marks (of C. P. Head & Co.) informing us thst the gold weighed 200 ounces, worth, st $16 per ounce, $3,200. This from a little over 70 tons of ore, crnshed hy five 650-pound stsmps, driven by a water wheel. The work of crushing, amalgamating, etc., was done in 10 days. He has now, ready for crnshing, some 70 tons more, which he expects will yield as well, if not better, than the last hstch.

British Columbia.

CASSIAR DISTRICT.

Discouraging News.—Nanaimo *Free Press*, Aug. 5: The steamer Otter, Capt. Lewis, arrived from Wrangel and way ports yesterday morning. The news from the mines is of a very discouraging character. A great many of the claims on Dease creek, of which so much had been expected, hsve, after heing thoroughly prospected, turned out nothing. On Thibert creek the result is somewhat similar; many claims after bottoming fonnd hut little or no prospects. A few claims on Dease creek are making a little mouey. The wster was down and work was ahle to he proceeded with to advsntage. They are rumors of rich bench diggings heing discovered, but they cannot be traced to any reliable source. Gruh is still very high and great disssfsaction is expressed at the monopoly which exists—the steamhoat and a certain party having it in their own hands charge jnst what they please.

Colorado.

Clear Creek County. — *Colorado Miner*, Aug 8: The Pay Rock and Hopewell are heing stesdily worked by Messrs. Ellis & Fairhsnks, who are employing a force of 30 men on the two lodes.

Gilpin County.—Mining is going on actively all over this district.

Summit County.—In Pern district, from the hesd of the Snake to Montezuma, prospecting is heing carried on with considerable activity. Jooker & Co. are hnsily engaged opening the Veta Msdre lode, carrying a large, well defined body of hismuth qnsrtz, and only requiring depth to reach that valuable mineral, the bismnth silver ore. Opposite the Revenne mine, on Cooper monntsin, Lewis, Cowles & Co. have strnck some very rich lodes. Mr. Fillins says that, after a careful examination of this district, he is satisfied that it ouly requires a development of some of the mines in this section to prove it to contain some of the best mines in the country.

San Juan.—A German who has had experience in Swsnsea, hss put up a smelter in Baker's park. Green & Son's smelters will soon be in operation. The mines are being vigorously worked, hut there is a scarcity of labor. Lawsuits ahout the ownership of mines are already in progress. News from the mines flattering. Working men in demand at $4 per day. Lots of ore out ready for the smelters. Horsehsck prospectors and sore-heads have left disgusted hecanse they did not find $20 pieces on the croppings.

Idaho.

Mahogany.—Oyhee *Avalanche*, Ang. 15: We hsve good news from this mine. They have strnck s vein from 2½ ft. to 3 ft. wide of fahnlonsly rich ore, in the 9th level north this week. This new strike is an important item, inssmuch ss nothing of mnch consequence has hitherto been fonnd in the Mahogany north of the shaft. In the 9th level south they have also s'ruck a continnstion of the rich ore body found in the 8th level. Our prediction is now fulfilled, viz: that the rich ore hody of the South Chariot wonld eventually he struck in either the 9th or 10th level of the Mahogany. About 225 tons of Mahogany ore is now at the Ellmore mill ready for crushing.

Golden Chariot.—There are uow ten bars of Golden Chariot bullion, valued at $30,000, ready for shipment from this place.

War Eagle.—This mine has abont 180 tons of fine looking ore at the mill resdy for crushing.

Empire.—On the 5th inst. this mine shipped three hars of hullion, valned at $5,450.44, and on the 13th inst. two more hars valued at $4,274.40. The Ellmore mill is stesdily running on Empire ore.

Pcorman.—Snperintendent Hoyt is sinking the new shaft and rnshing forward the hnilding of the new hoisting works as rapidly as possihle. The machinery hss arrived from Winnemucca.

Pauper.—The old Mahogsny hoisting works were purchssed by the Psuper company, and superintendent Phehy has them in operation on the mine.

Ida Ellmore.—The 10th level is yielding some good ore, with favorahle prospects for striking something better before long.

The Pavilion by Gaslight.

Tnesday night the Fair opened in good earnest, and the zest with which the three or four thonsand visitors entered into the enjoyment of the fsre presented, augurs well for the succeeding days and weeks, when everythiug shall have heen gotten in order and the attractions increased three-fold.

To those who saw the confusion and apparently hopeless disorder which reigned in the Pavilion on Monday, the tidiness and system which prevsiled on Tnesday, together with the gayety and even magnificence which the ten thousand gas-jets, aided hy the monster reflectors, lent the scene, provided a genuine and very pleasant surprise. The excellent music of the hand cansed tho gaily dressed ladies and their escorts to get up a sort of impromptn promenade concert, and the play of the fountains sparkling in the light, added the element of outdoor nature and helped greatly to intensify the feeling that a species of indoor picnic wss under wsy. Apropos of the fountains, the central oue deserves a medal for high play. Its jet touched the heam in the center of the arch, a trifle of ninety feet, and was so hoisterous withal that it was found necessary to put a stop to its fun while the hand played.

Progress Made.

The hall shows evidence of increased activity on the part of the exhibitors. They seem to be running a race, and rapid progress has really been made. It is to he regretted, however, that so much useless procrastination has heen shown. Considering the fact that every inch of space has heen taken, the display is not as full as it ought to he, although the hackwardness is only relative; the absolute quantity of material being even now much greater than at any previous Fair at the same stage.

The Music.

The musical feature is one of the most enjoysble of the Fair. Ths music itself has so far been of superior quality, and is greatly enjoyed hy the visitors. A capital treat in the musical way on Tuesday was the grand piano chorus given by twelve gentlemen performers on the Hallet, Davis & Co.'s pianos. It attracted crowds of listoners from sll parts of the hall, and elicited round npon round of applause. The enterprise of the owners of the instruments in furnishing this entertainment deserves especial praise.

In a few days things will settle down and hecome orderly, and this will, of course, produce a corresponding increase of interest. As it is, there cannot be a moto interesting place to visit than the Pavilion. The great puhlic interest already shown, indicates that this is to be the most succssful fair yet held.

The Seattle Cosl aud Transportation Co. are now filling the shute in Seattle for the purpose of losding a vessel with 1,300 tons of coal. They now use and employ two stesmers, two harges, one engine, some forty or fifty men, and a good force of horses.

The shaft of the Livermore coal compsny is down 200 feet, following a three-foot vein of first-olass coal. They expect to hegin shipping in three weeks.

The mines at Columbia, Tuolumne county, are psying well, and the yield, for the numher of miners now at work, is even hetter thsn in former years.

The numher of tons of ore worked hy the Belcher company dnring the month of July was 12,289 tons; bullion, $694,000; average per ton, $56.48; expenses, $316,000.

On Perry creek, B. C., the Rohert and Montgomery compsuies are doing well. On the same creek, and on the Mojole, Chinamen sre making from $4 to $8 per day.

Upward of 125 bnildings in the town of La Porte, Plumss county, have been removed, snd the ground piped away hy Oonly & Gowell, in the last few years.

An attempt will be made to introduce the Lincoln coal into the Vallejo market. It is expected that it can be sold for about $8 a ton.

Fant & Co., in Light's canon, Plnmas county, after a run of two weeks with three men, made a clean-up of $2,800.

The Zacatero gold mine, at West Point, Calveras county, last week yielded $7,000.

General News Items.

Now that the Saucelito narrow-gauge railroad has heen extended to San Rafael, the people of Marin county contemplste the formation of a mammoth milk joint stock compsny, to snpply this city daily with fresh milk from that county. The company will hny the milk from the dairy men, says the *Journal*, run it to the city hy a special or early train, and deliver from wagons to cnstomers. The milk will be as fresh as any that can he snpplied in the city, and as it is proverhially much richer and hetter thsn the product of ordinsry pastures, it is snre to find a resdy msrket.

The Bellinghsm Bay *Mail* is informed that the settlers on some of the San Jnsn Islands are mnch embsrrsssed by the presence of large herds of sheep on the principal sheep ranges of the county, which are owned by British snhjects who reside in Victoria, and who are only represented by Indian herders. It says this is getting to he an intolerahle monopoly, and one which is ruinons to American citizens, whose means are so limited that they are unahle to fence their ranches, and protect their interests from the encroachments of these non-residents.

On Monday evening the Pavilion contained as great a qnantity of goods as had by any previous Fair on the day of opening, yet not much more than one-third of the space taken was occupied. This gives an idea of the comparative magnitude of the present exhibition.

News from Gnatemsla is to the effect that Commandsnt Gonzales, of Magee ontrage notoriety, and his accomplice, Bulnez, have heen tried hy a Court-martisl and sentenced—the former to five yesrs' penal servitude, aud Bulnez to two years.

News from Europe in reference to the grain prospect is still in favor of California farmers. The crop in England, it is now estimated, will he helow the aversge, while the supply of old wheat is nearly exhansted.

Immense piles of grain are heing stored at Colusa, Princeton, Jacnto, Grimes' landing and Grand Island. Farmers are still holding their grain for sn advance in the market.

The grape crop of Pierce county, W. T., is very promising. The hnuches are numerous and very large, and the herries are plump and very healthy.

On Monday afternoon over two hundred and fifty mechsnics and lahorers were hammering, painting, hauling and fitting up the Pavilion generally.

A thousand tons of chrome iron from the Sonoma mine hsve been shipped to Philadelphis, and the work of extracting the ore continues.

The Los Angeles Tohscco compsny have commenced the manufacturing of cigars from tohacco grown there this season.

A storm of rain and hail passed over northern Idaho week before lsst and did some damage to the growing crops.

The annnal report of the Acclimatizaiou society shows that good work hss heen done in stocking our waters with fish.

Three months ago much of the lumher used in hnilding the Pavilion wss growing in the forests of Oregon.

Some of the timhers composing the Pavilion measure 80 feet in length, 12x12 inches, without a knot or flaw.

The trial trip of the "City of Pekin," the new Pscific Mail steamer, proved a success at New York, on Tuesday last.

The daily papers are in a row over the quaiity of their respective telegraphic dispatches. "Yon're auother," is the style.

The grain crop on the Sound is unusually heavy this year. Farmers are now in the husiest part of their harvest.

No drought, chinch hugs, grasshoppers, locusts, potato hugs, weevil or caterpillars to hurt the crops or fruits of Oregon this season.

Seventy cents a hnshel is the price for wheat at Salem, and sixty-five cents in the towns above.

A Washington county farmer hss 600 hushels of new wheat in store at Corvallis.

Mining Accidents.

On the morning of the 17th inst., hetween three and four o'clock, an accident occnrred at the Belcher hoisting works, killing engineer R. D. Bray, and seriously injuring Alfred Donald, a night hoss. It was cansed by the hreaking of a fly-wheel. The wheel had eight segments, and only half of them remained on the shaft; the halance flying npward, cut through ten-hy-ten timbers, and a large steam pipe of the incline engine, destroying a large portion of the roof and landing 200 feet in the rear of the works. Cntting the steam pipe filled the hnilding with steam so that others could hardly comprehend the true nsture of the accident until the supply had been shut off from the hoilers. The accident caused a delay of 36 hours in work at the mine.

On the morning of the 19th, an accident occurred at the Savage mine, similar to the one that happened at the Belcher. The large cog-wheel that is attached to the engine suddenly flew to pieces, but, fortunately, the engine was running very slow at the time snd no one was hurt. A large number of miners were standing around the shaft, resdy to descend helow to commence work. They made a general stsmpede, and all escaped from heing injured. The cage, loaded with ore, was caught about 100 feet from the surface hy means of patent fastenings. A new wheel has been ordered from San Frsncisco. All damages will he repsired in four or five days.

Another coal miner, Richard Ssvage, met his death this week in one of tho chutes of the Black Diamond mine from an explosion of foul gss, ignited hy his open lamp, he having neglected to take the safety lamp provided for the men in such workings, as was the case with Mr. Wesley, who died from like cause last week; though the jury of inquest in that csse charge part of the responsihility on another workman, in hsving left the air pipe covered with s shovel, as well as to his own neglect. The light of the safety lamps is not, it is said, so good, nor are they as conveniently msnaged as the common open lamps, and this prohahly inclines the miners to take lsrge risks of life rather than use them unless they have special reason for helieving it necessary. Mr. Savage's death was the third that has occnrred at the Black Diamond compsny's works within the term of a little more than a week, that of Owen Williams having preceded that of Mr. Wesley a few days, and resulted from the fall of a mass of rock npon him in one of the gangways at the moment he was setting timhers to support it. A man named D. Sitcovitch had his right leg hrokon helow the knee last week, hy a cave in the Amador mine at Sutter creek.

Never since the first settlement of Bentou county has there been such an acreage of grain to cut, aud never were the farmers more intent ou their work. Hsrvesting is all the go.

Mr. Foersterling, of Columhis, Tuolnmne county, last week picked np a nugget worth $90.

The grading of the Monterey and Saliuas Valley Railroad will he completed within a fortnight.

A marble quarry has heen discovered on the head of Butte creek, in Clackamas county, Oregon.

All the Chinamen have heen dischsrged from the coal miues at Tenino, W.T., and white meu taken in their ;lsces.

The Buckeye quicksilver mine, Colus county, is rctorting and shipping about 1,300 pounds per week.

A company is to he organized to develop the coal miues in the Sutter Bnttes.

A new mill is heing huilt at the Occidental mine, near Nevada city.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Aug. 18th, 1874.

For Week Ending Aug. 4th, 1874.

Nozzle or Hose Sprinkler.—James H. Fowler, Oaklaud, Cal.

Car Coupling.—Thomas J. Hnbhell, Yountville, Cal.

Trade-Mark.

Cigars and Tobacco.—The Consolidated Tobacco Co., Gilroy, Cal.

———*The patents are not ready for delivery hy the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possihle (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend in send none but worthy men.

L. P. MCCARTY—General Agent.
W. H. RATTENBERRY—California.
CHAS. W. OTIS—Contra Costa County.
CHAS. T. BELL—Alameda, Santa Clara and Santa Cruz Counties.
J. W. ANDERSON—Orange and Santa Ana, in Los Angeles County, Cal.
HOON ALSTON—San Luis Obispo, San Bernardino and San Diego Counties.
JAS. KEAGNEY—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. GOONWIN—Sacramento County.
S. G. CRAWFORN—Nevada, Sierra and Plumas Counties.
J. G. KELLEY—For Washington Territory.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS.

Mining and Scientific Press,

(Established in 1860.)

The oldest, largest and best Mining Journal. Devoted, also, to Science, Invention, Mechanic Arts and Industry on the Pacific Coast.

Subscription to the above, $4 a year; Sample Copies, post paid, 10 cts.—four for 25 cts. Address,

DEWEY & CO., Publishers.
No. 224 Sansome st., S. F.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. RUCKER, M. D.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly,

A. M. GASS.

THE MINING AND SCIENTIFIC PRESS, San Francisco, we regard as the best paper for miners published anywhere in the world. Subscribers should be careful to put on file each number; and each year's edition, bound in a volume, would prove a most valuable book to all reading men engaged in mining or in the reduction of ores.—*Boulder News.*

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Eagle Quicksilver Mining Company.—

Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—Is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1874, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Monday, the 31st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H WATSON, Secretary.

Office, Rooms 5 and 6, No. 302 Montgomery street, San Francisco. jy-25

El Dorado North Mining Company—Location of principal place of business, 215 Sansome street, room No. 2, San Francisco, Cal. Location of works, Philadelphia District, Belmont, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of August, 1874, an assessment (No. 1) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 215 Sansome street, room 2, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on sixth (6th) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors. GEO. E. HOUGHTON, Secretary.

Office—No. 215 Sansome street, San Francisco, Cal.

NOTE.—Since levying the above assessment, the office of the El Dorado North Mining Company has been removed to room No. 4, Heyward's Building, No. 419 California street, San Francisco, Cal., and said assessment is made payable to the undersigned, who has been duly appointed Secretary of said Company. FRANK SWIFT, Secy. ag15

Electric Mining Company—Location of principal place of business, San Francisco, State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of June, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 10th day of June, 1874, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the salesroom of Maurice Dore & Co., No. 326 Pine street, San Francisco, California, on the 5th day of August, 1874, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.

Office—No. 318 California street, room 13, San Francisco, Cal. jy18

POSTPONEMENT.—The above sale is hereby postponed until Tuesday, the twenty-fifth day of August, 1874, at the same hour and place. By order of the Board of Trustees. A. B. PAUL, Secretary.

Germania Mining Company—Location of principal place of business, San Francisco, State of California. Location of works, Tintic District, Juab County, Utah Territory.

Notice is hereby given that at a meeting of the Directors, held on the fifth (5th) day of August, 1874, an assessment (No. 2) of one dollar per share was levied upon the capital stock of the company, payable immediately, to the Secretary, at the office of the Company, 408 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the second (2d) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. W. TRIPP, Secretary.

Office—No. 408 California street, room 16, San Francisco, Cal. ag15

Kincaid Flat Mining Company—Principal place of business, San Francisco, California. Location of works, Sonora, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of August, 1874, an assessment of two dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 217 Sansome street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2nd day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 12th day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. R. CORNELL, Secretary.

Office, 217 Sansome street, (up stairs,) San Francisco, California. ag22

Plumbago Gold Mining Company—Certificate of incorporation dated and filed in the office of the County Clerk of the City and County of San Francisco, California, June 24, 1864, No. 3346. Mine and works at Plumbago Ledge, Sierra County, Cal.

TO ALL WHOM IT MAY CONCERN TO KNOW: The representatives of two-thirds (⅔) of the capital stock and stockholders of said corporation, having made and filed with the Board of Trustees, on the 4th day of August, 1874, their written assent that the place of business of said corporation should be changed from the City and County of San Francisco, to Minnesota, in Forest Township, Sierra County, Cal.

Notice is hereby given, that it is the intention of said corporation to remove its principal place of business from the City and County of San Francisco, to Minnesota, in Forest Township, in Sierra County, immediately after publication of this notice for the period of thirty days from its first insertion in the MINING AND SCIENTIFIC PRESS, a newspaper printed and published in the City and County of San Francisco, Cal. Done by order of the Board of Trustees. S. B. DAVIDSON,

Secretary Pro. Tem.

August 4, 1874. 6w28-1m

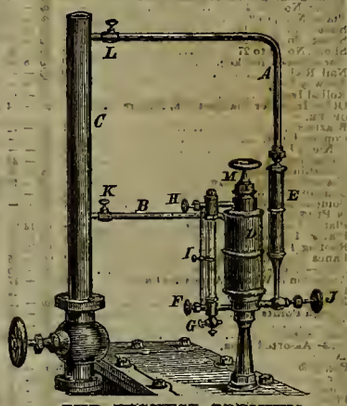
This dividend will be payable on and after the 17th instant, at the office of the Society, 411 Bush street.
GUSTAVE MAHE,
eg15-4t Director of French Savings Bank.

Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe O; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted t give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

THE AMERICAN TURBINE WATER WHEEL.

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 50.03; ½ 69.64; ¾ 78.73; ⅞ 82.53; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. Emmerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

Metallurgy and Ores.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine those pans and setters for themselves, at the office, 229 Fremont Street, San Francisco.

Fourth Year of the Pacific Rural Press.

The publishers of this journal design making its weekly issues during its fourth year (1874) still more acceptable and valuable than those of the past.

A Farmsr's Paper Always.

The RURAL PRESS—established Jan. 1870, has been thoroughly a farmer's paper—" first, last, and always." Its success in popularity and rapidly increasing circulation has exceeded that of any other weekly on the coast.

Neithsr Politics or Creeds.

We refer with satisfaction to the independent, chaste and useful character of our reading matter and the absence from our columns of questionable and demoralizing advertisements.

We shall strive to make it an ever welcome visitor to those who desire to constantly

Improvs ths Heart and Mind,

And shall give a larger space to our HOME CIRCLE department, which from the first has been a popular feature of the RURAL.

Our aim is to gather information from all reliable sources, in the varied forms in which it is to be obtained. Our work is to divest our gleanings of all superfinities; condense such information as is of most importance to our special class of readers—give it to these in the plainest and fewest words possible,—saving *their time* by *our labor*.

Our Leading Departmsnts

Will be continued under the following heads:

The Home Circle,	The Horse,
Young Folk's Column,	The Swine Yard,
Short Stories,	Sericulture,
Home and Farm,	The Vegetable Garden,
Useful Information,	The Flower Garden,
Domestic Economy,	The Vineyard,
Good Health,	The Orchard,
The Dairy,	Tropical Fruits,
The Apiary,	Small Fruits,
Poultry Notes,	The Cereals,
Horned Stock,	Pastnrage, etc.,
Sheep and Wool,	Fertilizers,
Goats,	Miscellsneous.

Practical Farmers

Know how important it is that the above subjects should be treated from a local standpoint—that generally the farming tactics of the East will not do for this coast, that agriculture, in its infancy here, can derive greater benefits from an exchange of experience through the columns of the press than in older fields. Constantly observing and studying developments in the special field we represent, we can be expected to give truer information on agricultural subjects, than more general writers at home or abroad.

Our Traveling Correspondsnts

Will do much service by gathering a large amount of interesting information from various parts of the Coast, which, but for their research and practiced observation might never be placed on record or reach the eye of the reading public. Of our many

Local Correspondents

We have particular reason to be proud. No paper on this Coast—old or new—has ever been so highly favored with volunteer contributions. They are talented, reliable, independent and generous representatives of an intelligent and enterprising people, noble types of good humor, unselfishness and true progress.

Short Stories,

Original and selected, will hereafter appear in each number. Their selection, we trust, will be such as to render them popular and unobjectionable to all. In addition to a large number of

Fine Engravings,

Representing Choice Stock, Farm Products, Scenery, Remarkable Productions, Improvements in Farming Implements and Machinery, Works of Art and the Beautiful in Nature, we shall from time to time present the modest

Faces of Prominsnt Farmers

Who, as pioneers in the development of agriculture on this Coast, or as active laborers in the "Farmers' Cause," are worthy of the distinction they enjoy, and the favor with which they are looked upon by our many readers at home and abroad.

Engravings (costing thousands of dollars originally) are inserted in our columns during a single year. They afford instant and perpetual impressions often more perfect and real than words can convey.

Patrons of Husbandry.

We shall continue to give our weekly summary of matters connected with the interest and progress of this growing and important movement. We shall aim to give information as fresh as possible in this department. Its readers are aware that the RURAL has been in the lead in calling farmers to organize. We shall continue to work zealously with the Granges for the noble objects of the Order.

The present is an

Important Period

In the history of our Coast. The coming 12 months promise greater developments in its agricultural progress than has been experienced in any previous year. Agriculturists are alive to improvements in every direction, and those who would keep up with the spirit of the times should certainly read the RURAL PRESS.

Ths S. F. Markst Reports

Will receive greater attention in the department of DOMESTIC PRODUCE than that of any other weekly journal. We shall spare no pains to render the reports as reliable and complete as possible. By the employment of our special reporter we hope to make this very important part of our paper one of its best and most satisfactory features.

Kind Words and Acts

Have done much to build up in this isolated and sparsely settled coast so large and complete an agricultural journal as the PACIFIC RURAL PRESS. We commence the new year with a regular circulation of

Ovsr 5,000 Copiss,

A far greater issue than that of any weekly on this Coast, independent of a daily publication. If our friends will continue to "help us help ourselves," we hope to reach a circulation of 8,000 this year, and do a correspondingly greater service of good. While we have the greatest advantages and can make by far the best weekly for

Agriculturists on This Sids of ths Continent,

We cannot expect one-half so large a circulation as journals in older and more populous districts. Consequently readers cannot rightly expect such a paper here at Eastern rates.

No Premiums But a Good Paper

Do we offer. A flashy chromo (or cheap map), with an ill suited paper, will hardly satisfy the farmers of this Coast, whose time is too precious for trifling. To many of you the benefit of a reliable and valuable paper should reach a hundred fold its cost, while to all a poor journal would be dear at any price.

Sample Copies Furnished Free

On receipt of stamp for postage.

Agents are Wanted

Who will do more or less active canvassing. To such we will furnish free samples and pay liberally for their services.

Removal.

July 13th, 1874, the business office of this Journal was removed just one block east of our former location, to No. 224 Sansome Street, southeast corner of California, over the Bank of British Columbia, where we have secured large and elegant quarters. This removal is made in consequsnce of the sale of the building which we formerly occupied, to parties who will proceed immediately to demolish the present structure and erect a new and magnificent block in its place.

[Diagram Showing Location of Dswey & Co.'s Nsw Offices.]

Hints to be Remembered.

A note dated on Sunday is void.

A note obtained by fraud, or even from one intoxicated, can not be collected.

If a note be stolen it does not release the maker—he must pay it.

An indorser of a note is exempt from liability, if not served with notice of its dishonor within twenty-four hours of its non-payment.

A note by a minor is void.

Notes bear interest only when so stated.

Principals are responsible for their agents.

Each individual in partnership is responsible for the whole amount of the debts of the firm.

Ignorance of the law excuses no one.

It is a fraud to conceal a fraud.

The law compels no one to do impossibilities.

An agreement without consideration is void.

Signatures in lead pencil are good in law.

A receipt for money is not legally conclusive.

The acts of one partner bind all the others.

Contracts made on Sunday can not be enforced.

A contract made with a minor is void.

A contract made with a lunatic is void.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

(Covered by Letters Patent of July 2d, 1872, and recent applications.)

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed into it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz, and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

VOLUME XXIX Number 9.

Improved Tools.

Abont four years ago we called the attention of our readers to a line of new tools, koown as "Bailey's Patent Adjnstable Planes," then beiug introdnced for the first time into the markets of the Pacific coast. We gave at that time our opinion that a step had been taken, in the improvement of this most commou of all tools for wood-workers, which would be recognized by that entira class of mechanics, as a snbstantial benefit to them in their dsily pnrsuits

We gave illustrations on tha former occasion of both the iron and the wood smooth planes, and explained the method of fastening the plane-iron in the stock by a cam, instead of by driving a wedge, as also the accnracy with which the plane-iron can be controlled by the positive action of a thumb-screw, instead of the uncertain strokes of a hammer. At this time we fnrnish illustrations of two planes, now included in the assortment of Bailey's planes, each of which has special features, and a variety of uses for modern carpenters and general wood-workers.

The block plane (No. 9½), is a small plane, having a single iron set at a low angle and whetted from the upper side. The plana may be held in the hollow of the hand, with the forefinger resting on the brass thumb-screw near the front of the plane. It has no equal as a tool for planing endwise of the grain, or for fitting nice joints at the ends of mouldings or other kinds of work.

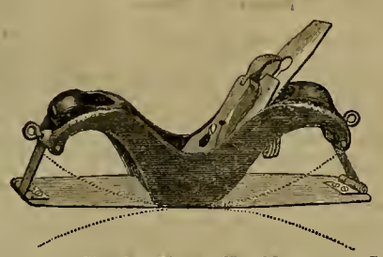
The circular plane (No. 13), has a flexible steel face, and by means of the thumb-screw at the end of the stock, the face can be adapted to plane a surface either concave or convex, as easily as an ordinary plane will smooth a flat surface.

It will be seen that the two planes here presented are indispenenble to the mechanic who wishes to avail himself of tha lateet improvemente in such tools. The use of any of Bailey's patent adjustable planes will do more to secure for the workman nniformly good work, and in the least possible time, than any tool of ite kind now before the mechanice of the country.

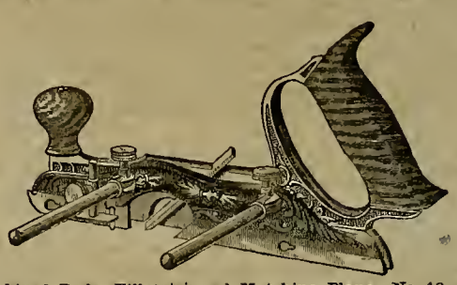
Another improved tool, an adjustable plow, etc. (No. 41), embracee in a compact form enough tools, as formerly sold eeparately, to nearly fill an ordinary tool-chest. The various parts are made of metal, and are not eubject to any change by warping. More than 30,000 of these tools have been eold, and their use eeeme likely to enpereede the old-fashioned wooden tools, ae the price at which they are sold is hardly mora than the price formerly paid for an ordinary plow.

A combination tool, mote recently introduced, a dado, filletster, etc. (No. 46), will be found a good improvement over any tool yet introduced for similar purposes. Cuttere accompany this tool hy which a dado of any required width can easily be had, while the tool may also be adjusted for plowing and matching.

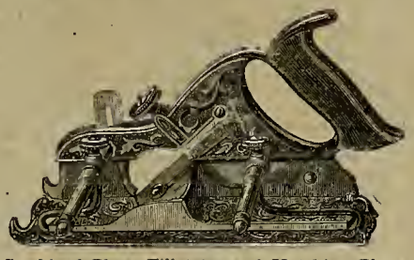
Printed instructions accompany all the tools referred to here. Illnstrated circulars, with full descriptions of the tools, may be had by applying through the mails to the mannfacturers, the Stanley Rule & Level Co., of New Britain, Conn., with warerooms at 35 Chambere et., New York. The tools are to be fonnd in hardwara storee throughout the country.



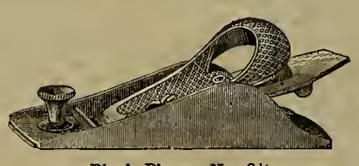
Circular Plane. No. 13.



Combined Dado, Filletster and Matching Plane. No. 46.



Combined Plow, Filletster and Matching Plane. No. 41.



Block Plane. No. 9½.

Casks by Machinery.—We learn from M. Fulda & Sons, of the California Wine Cooperage Company, that they will eoon have a new factory at work on Spear etreet, turning out stock for a large amount of work this seaeon.

The minoe in Little York townehip, Nevada county, are better than ever before, and very heavy results are looked for from next year's run.

All of the Silver city mills are running full blaet, on ore from the Comstock and neighboring mines.

A Splendid Success.

The Exhibition has now reached the end of its second week, and is daily becoming more and more attractive, both in the matter of exhibits and in the personality and magnitude of the attendance. The construction and arrangement of the present building is such as to furnish many decided advantages over any one previously erected by the Institute, whether in the matter of convenience for promenading, or for displaying and viewing articles on exhibition; the increased breadth of the aveuues and resting places, and, above all, the magnificent promenade along the gallery fronts, are most important and attractive features, and in striking contrast with the contracted arrangemente of structnree of the kind which have heea previously erected in this city. The advantagee and necessities for something really valuable in this direction were most happily alluded to in President Hallidie's opening address, as follows:

And, from the eocial standpoint, these exhibitions are eqnally a necessity. Elsewhere, in more favored summer climates the parks, the public walks out of doors offer opportuoities for public gathering; here in San Francisco the driving wind and damp fogs from the ocean prohibit out-door amusements. * * Under this canopy of carpentry, this structure dedicated to the mechanic arts, the people of this city can gather, protected from exposure to our sea fogs and summer winds, and enjoy the music from a well-trained orchestra of excellent musicians, wander through avenues flanked by specimene of industry and art, or stroll in the quiet of the art galleries among efforts in the department of the higher arts."

That the public entertains a just appreciation of this thonghtful effort for their pleasure and convenience, is amply shown in the great increase of attendance. The visitor is completely lost in bewilderment at the vastness of the building, the interminable extent of its avenue, and the almost endless variety of articles on exhibition. He is led along as if by magic, and all unconscious of fatigue, while he threads the graceful meanderinge amid the profusion of tablee, etands, pyramids, show cases and cosy little recesses which appear and disappear by turns, as he makes the full round of this great palace of California industry.

The managers deserve the highest credit for the taste and judgment they have thue far displayed in the arrangement and conduct of the exhibition. Refreshments are provided for the hungry, mild potations for the thirsty, and abundant sitting convenience for the weary. The lovers of mueic are bounteously entertained by a splendid brass band, located near the center of the Pavilion; while those who prefer parlor music can enjoy that from the pianos, located in one of the cosy corners of the western gallery, furnished by some of the best artists in the city. Taken as a whole, California may well be proud of this grand display of her skill, industry and taste, and the Institute may he congratulated on the complete financial success of the undertaking, the receipts from which have thus far exceeded all expectations, and give indubitable evidence that the final total well will nigh pay for the entire outlay, with running expenses. Such a result will enable the Institute to appropriate the bulk of its receipts from future exhibitions to the construction of a more magnificent edifice, which will become a real and permanent palace of industry, that will remain for centuries to come the grand central point of industry and art on the Pacific Coast.

The minere and laboring men of Grass Valley want a savings bank established in that city.

National Sportsman's Association.

The time hae been when the term sportsman was supposed to be depreciative of character; but that has past. The sportsman'e clubs throughout the land have been of service to the country to an extent that cannot he estimated by money valuation. It is principally through their persistent endeavors that the game laws of the different States have been suited to the needs of the present time and to the demande of the future; and their watchfulness has done a thousand fold more than any official efforts in securing the efficiency of the game laws. Tha wasteful and almost willful destruction of game hae been, to a great extent, stopped; and the streame of the country have been stocked with material that will furnish coming generations with a vast amount of wealth, comfort and pleasure. It is proposed now to hold a national eportsman'e association at Niagara Falls, on September 9.h, 1874. The benefits to be derived from the formation of such an association in providing for the protection of game in the partially eettled and newly acquired territory of the country, will be apparent to all; and we hope California will be duly represented at the meetiug at Niagara Falls; and that the sportsmen of our State will look ont for tha interests of game in the country at large.

Del Norte, Colorado, has gone wild over another new discovery. This time it is gold quartz, and aseays $5,000 per ton.

Sanitary Condition of the State.

The State Board of Health has issued a circular, signed by Dr. Thos. M. Logan, Secretary, for the purpose of obtaining as much as possible of the information which may hava accrued since the American occupation of California, respecting the effects of settlement, cultivation, drainage, irrigation, mining operations, aqueducts, reservoirs, forest and tree culture—especially of the *Eucalyptus Globulus*, or Australian gum tree—upon the sanitary condition of the inhabitants. This information is desired more particularly with a view of discovering some means of controlling—or, at least—of modifying the influence of malaria in the production of fevers, and also of determining by the vote of representative men both in and out of the medical profession, the prevalence of consumption in each section of the State, in its relations with soil-moisture, unaffected by immigration or emigration, likewise the best climates and localities for the amelioration of its special types and stages.

Dr. Logan solicits answers to the questions printed in the circular, and states that extended answers, striking exsmples in illustration of theories, topographical description of places represented, or a monograph on any subject, germane to these inquiries, provided it is written in a compact manner, would be gladly received.

The questions addressed to persons in different localities throughout the State are about as follows: character of soil; nature of subsoil; average altitude; population of district; number of acres of low or wet land; number and character of streame, sloughs, ditches, aqueducts, ponds and other bodies of water; season of year when water is stagnant on certain sloughs, streams, etc.; season when beds of streams, ponds, etc., are dry; topographical changes; natural and artificial drainage; number and size of drainage ditches on wet lands, and effect on health of residents; number of acres under cultivation; proportion of land covered with timber; kinds of timber originally growing and now predominating; extent of plantations of eucalyptus; quality and source of drinking water; depth and number of wells; distancee of wells from cess-pools; proportion of deathe to inhabitante; prevalent diseases; malarial diseases and results; increase or decrease of malarial diseases; cauee for increase or decrease of diseaee; number of deaths from consumption; results as compared with former years; caaees or circumstances attributed; climatic conditions during year; rainfall; average rainfall; proporlion of sunshiny days; average temperature; months favorable and unfavorable to consumption; does tubercular or scrofular consumption originate in the locality above 5,000 feet; percentage of persone of marked scrofular diathesis emigrating from low to high altitude who have been benefited by ohange; has altitude seemed to have injurious effect on such; instances in which planting of trees, especially the eucalyptus, has exercised a modifying influence on intermittent or malarial diseases, etc.

If it is a possible thing to have these questions correctly answered from all the localitiee to which they are sent, the State Board of Health can compile facts of great benefit to the people of the State. Every person who receives one of these circulars should endeavor, to the best of his abitity, to anewer as many of the queetione ae possible, for in so doing he will assist greatly in a laudable object.

Friday morning, Frank B. Crane, of the old Brigge orchard, Marysville, forwarded a car of pears to Chicago by the expreee train. The freight on a car to Chicago is $900; to New York, $1,100. This price makes the railroad a partner in every fruit-ehipping housa in the State.

Smiley, of Douglas City, Trinity county, etripped 180,000 feet of bedrock this season, and cleaned up $22,000.

CORRESPONDENCE.

The Stickeen Mines.

EDITORS PRESS:—A deal has beeu said in connection with the Cessiar mines, of which there are statements published in the various issues daily; but none of which I notice are in harmouy, but conflicting with each other. Under snch circnmstances it is impossible for the public to be reliably informed upon the present or past state of that section of British territory. More especially in this advauced stage of the season I am surprised that some paper has not instructed some reliable and truthful reporter to secure substentiel and undispnted information upon the mines and the general aspect of the country iu the vicinity of the mines. Io the early part of the seasoo the public were entirely deceived by reports that all would have imagined would have been undispnted, by coming, as stated, straight from the mines, giving such glowing and flattering accounts of the richness and extent of the mines, with the difficulties they had to contend iu resching, part of which was trne, but with a deal of untruth. The consequeuce was, it raised quite a feverish excitement in California and neighboring Territoies, and many were eager to get out there, even st the risk of life, and only taking expenses in as a secondary consideration—for to a miner and prospector difficulties and dangers are no bar where there is a chance of making a rich strike.

The consequence wes that nnder these varions influences many left comfortable and steady employment, with amply filled purses and eager hopes to reach the nortbern El Dorado of the present day, and peid enormons and exorbitant passages to the mines by the different means of transportation then in use, in addition to their own hard toil. Ou arriving at Dease creek they found that they had been deceived by exsggerated reports; for npon my arrival there, which was early in the mouth of May, I found no available ground to take up, and little country available for prospecting. Nor could I see 24 miles of paying ground on Dease creek, as represented by one Peter Gargcvitch, *alias* "Peter the Great;" but to the contrary, sfter indefatigable prospecting, only developed six miles of ground, supposed to be payiug by prospecting, but which could not be fully tested until opened into working order. Owing to the many disadvantages the prospector was subjected to, through swolleu streams and gravel frozen through to tbe bed-rock; they were only able to prospect whatever grouud the nature of circumstances would allow.

At the same time I am not goiug to entirely repudiate every assertion made in respect to the couutry, for Deese creek has sufficiently established the fact, no later theu the eerly part of last spring, that rich ground has been developed; end the probabilities are that richer yet will be worked before the closing fall. But when we look et the extent of grouud payiug for miuing on, it is uot snfficient to cause any excitement outside of British Columbia. Although there may be a few payiog claims—some very rich — is thet going to support a community of about 2,000 miners? Up to July there were upwards of 1,100 miuers' licenses reudered. Still, I am confident I am writing impartially and justifiably when I state that the extent of ground developed at the present time will not sustain a community exceediug 450 or 500 of every grade and calliog, in accordance with the requirements of the place. Nor is there a probability of more on the outside being strnck this season; and, jndging from the features of that region, I am positive that there will never be sufficient developed to maintain a large community, for all the ground that is staked out now could be worked in six months, could the mioers ooly utilize the time by looger seasons.

As for the assertion that the appearance of the couutry is indicative of an extensive field for prospectiug—as a miuer I cannot see it io that light, for it is impossiblo to discover paying ground in swamps and marshes, intersected at distances with lagoons. And I have seen the assertion that ground is gold-beering throughout that region where there are deposits of gravel. Such is not the case, which I can prove by my own prospects, for in many places I could not obtein the color, thongh there were very good indications on the surface. In sddition, tbe country had all b en prospected thoroughly in the immediate vicinity of the miniug region and Dease lake, and no paying ground had been developed. Parties had been out to the head of the Rapid river without striking anything; this is a distance exceeding 30 miles; and other parties had been down the Delure river, some for a distance of 100 miles, where the slate formation gave out, and granite and sandstoue came in, with like success; and these expeditions had returned by the middle of July. As for the essertions which are invariably made, that men will speak hitterly against the country, owing to what they subjected themselves to, although justifiable in a certain sense, the public must not he carried away with the delusion that the great majority of miners came back before they could justifiably form a proper estimate of the country. In that they are deceived, for there were various parts of that country which could have been prospected as early as the middle of May, especially the smaller tributaries to Dease lake. A large part of the more isolated section of the country was found by parties to have been prospected last year. I myself prospected where I thought there had not been a humsn foot, but was soon disabnsed of that idea, by discovering foot-marks through the soft moss and the remains of old camp fires. Of course, I admit Dease creek and other deep creeks could not be prospected, owing to their swollen streams, but they did not exclnde other sections from being prospected. If reporters have any desire to be well informed, they should seek out men who have just come in from prospecting; from them they will be able to obtaio reliable and unbiased information. In referring to the record, I find Buck's creek, Dulure and Beadie creeks were developed last February, for there was very little paying ground available on any of the creeks after Jennary, although a deal of ground has obanged hands for large amounts—some interests ranging from $100 to $600 to the share, while claims have averaged as high as $1,500. I have not the slightest doubt bnt thet there will be large nnmbers coming down and taking passage by every steamer, as now they see all their visionary prospects blighted. There is no other alternative, the country affordiug uo inducement for employment to recruit their funds. THOMAS ROBERTS.

Virtue Ledge, Baker City, Oregon, Aug. 10, '74.

Hurdy-Gurdy Water Wheels.

EDITORS PRESS:—In a recent issue you have an article headed "Advantages of Large Wheels," which refers to the use of what are commonly kuowu as hurdy gordy water wheels for driving quartz mills. The article seems to intimate that the larger the hurdy wheels, the greater the advantage; while a critical examination of the statement of "a correspondent" would clearly show that it was *not* the diameter of the wheel that made the more favorable result, but the msuner in which it was geared. The small wheel made 160 revolntions empty, the large one 75. The former with five stamps gives 56 drops, and with 10 stamps 38. The large one, with five stamps, 82 drops, and with 10 stamps, 57. To my mind the defect pleinly appears in the manner in which they were geared, and not in the application of the water.

A carefnl estimate of the results derived, would show that the small wheel with 5 stamps, 700 ponnds each and six inches drop, and 56 drops per minute, would show a yield of three horse power; 10 stamps, with 38 drops per minute, would show a yield of four horse power; five stamps, 700 pounds each, 7 inches drop and 82 drops per minute, would equal five horse power; and 10 stamps, with 7 inches drop and 57 drops per minute, would show nearly seven horse power. By looking at the statement of "a correspondent," that the small wheel was worked at a very great disproportion of velocity, to its velocity runoing empty, 38 and 56 drops to 160 revolntions empty, tbe large wheel did not work under the same disproportion, 57 and 82 drops and empty 75 revolutions. If these figures are correct, we maintain there will be no difficulty in showing that the disparity existed in the method of gearing and not in the size of the wheels.

I wish to call yonr attention to another fact in that article which shonld be highly interesting to millmen. That is, where small quantities of water are used nnder high heed, to propel machinery. "A correspondent" states "that 60 ioches of water was used, miner's measurement," aud "the fall was 100 ft." Now, 60 inches of water, miner's messorement, equals 160 cubic ft. per minute of water, which ought to yield 25 horse power; or as some estimate a miuer's inch is only equal to 1.66 cubic ft. of water, it would be equal to 100 cubic ft. of water per minute, which, under 100 ft. fall, would equal 16⅔ horse power. As estimated above, we allow 2.66 ft. to one miuer's inch, which is the exact amount when the water is measured nnder a six-inch pressure. If tbese estimstes are correct, end we know they are, then the application of water by the hurdy principle is very extravagant, as we know full well by many experiments and many quartz mills now driven by other wheels giving more than double these results; or, in other words, more than double the machinery is driven by the ssme quantity of water under the same fall, by other water motors. Our experience is obtained from results secured by the use of Leffel & Myers' double turbine, whose wheel is now most generally used in this State and Nevada to drive quartz mills.

EXPERIENCE.

Mining at Jonesborough.

EDITORS PRESS:—By the kindness of S. L. Howard, Esq., I am able to furnish the following reliable information respecting valuable "gold diggings" at the locality known as Jonesborough (Dog-town Ridge). This place is eighteen miles from Oroville, on the west branch of the Feather river—west branch of north fork of the Feather river.

On tbe Dnrgan claim, which is the upper claim on the ridge, they ran in a cut and took out eight hundred dollars in ten days; finding that the bed rock pitched back, they went below and ran a bed-rock tuunel. On the 18th of August they had ron in 180 feet, and again struck the gravel bed. A large bony of gravel is in sight, which prospects from five to eight cents a pan.

The claims, for two miles down the ridge, show eqoally as well if not better.

The "Blue Hog" claim, the "Indepeudent" and another claim below, have been opened by cuts showing rich gravel. The bed rock pitching into the hill, they resort to tnnueling as in the Durgan mine.

The beauty about these mines is the abundance of water, the great fall, and the never failing supply of water. The fall is from five huodred to six hnndred feet. The dump is one thousand feet.

Colonel Whitemau or Whitemar, nf San Francisco, is now there and opeuing a ditch to the mines. A company of forty men have located the fluming right for three miles up and down the river; into which all these mines will dump their tailings.

Mr. Howard, my informant, is a practicsl miuer of twelve years' experience, end he does not hesitate to say that these mines are among the best in Northern California.

Timber in abundance can be had within a radius of a mile from the mines. Geutlemen wishing to visit these mines can travel by cars to Oroville snd then take the stage to Jones' ranch. The stage at present starts on Wednesday at 7 A.M. and Saturday at 7 P.M., or on the arrival of the cars at Oroville. The hotel at Oroville is large, clean and roomy, sets an excellent table, and an obliging host presides over it.

The stage to and hotel accommodations at Jones' ranch are all that can be desired, as I am informed. More enon es I use the one and shall visit the other to-morrow. Mr. Howard hes promised your correspondent to keep us posted on fnture developments of the mines.

D.G.

Forest City Mines.

In a letter to the *Mountain Democrat* a correspondent says: Forest city is now one of the liveliest and most prosperous mineral sections in Sierra. As in the historic days of '49, everywhere was heard the jingling of coin, and "games" are in progress day aod night at West and Knowles saloon, which does a rushiog business. New bnildings are being pnt np in all directions, and the loud, steady ring of the hammer and the pick echo and re-echo far and near, up the high mountsins and down the deep cañons—even to tbe remotest breasts and shafts in the long tunnels, filled with busy toilers, unlocking the treasures of the world.

Prospectiug is going on vigorously, and everybody wishes and expects to strike as good diggings as the Bald Mountain. Half a mile below Forest city is the Yellow Jacket, Eastman, Kenselhack & Harp, owners, under the management of Petroleum V. Nasby. They have fiue prospects and very coarse gold. Treloar & Lee ere working Oregon creek, making their regular eight dollars a day. Tbe Welsh Co obtain good wages ont of the old Oregon clsims. Holmes & Hasner have leased the Live Yankee, with similar returns. The Sonth Fork have their tunnel in 1,200 feet, ruouing night and day; and by next spring expect to strike pay gravel. Rich streaks have already beeo fonnd; the lead is pitching, and, it is sopsuppose, 300 feet further will bring the rich ground into the tunnel. This claim is adjacent to the Bald Mountain. The North Fork boys are pegging away night and day with excellent prospects of puttiog their tunnel through by next summer; now in 2,516 feet. The Red Jacket, formerly Young America, owned by Heintzen, Nelson & Co., have already commenced their tunnel, which will be extended until it drains the whole ridge back to the Highland and Masonic shaft. This is one of the best located claims in Forest city, lying between Crane, Hauley & Co's and the Live Yankee, cornering on the Highland and Masonic. Next in importence is the Wisconsin, on the northwest side of Forest City ridge. The tnnnel here, 1,500 feet in length, was commenced in 1854, and has cost np to the present time over $36,000. It is too high to work the ground, but the company is satisfied that the running of another one 500 feet long will make their claim a valueble piece of mining property. The Bald Mountain Co. are working a large crew of men, filling their pay dumps for the incoming water season Their claim yields ss richly as ever. The net profits siuce the first of January last have been $110,000, making a dividend of $5,500 to the share or claim.

COAL.—Onr coal burners are busily at work conveying this necessary article to the smelting works under the supervision of Mr. Prescott. We are glad to see the steady, business-like maoner with which this enterprise is being csrried forward. There is no bombast — no extra assertions being made, but the work of getting ready for a rnn is being done silently and thoroughly. No doubt can exist that, when fairly ready, a start will be made resulting in the most complete and perfect success. This is of much more benefit to our people tban dozens of columns of reports or newspaper articles, and assures us that what is beiog done will end a long suspense one way or the other, and will demonstrate, beyond a donbt, a fact we all desire to know, whether our ores are susceptible of treatmeut or not.—*White Pine News.*

Three models for the deep-water ship, to be built at Vallejo, have already been submitted to the ship-building company.

Experiments in Explosives.

On Saturday, the select committee on explosive substances (the seme which has arranged for the meeting of Parliament, after the recess, the interesting spectacle of a member of the outside pnblic in custody at the bar of the House of Commons) had the opportnnity afforded it of observing in action one of the principal agencies which comes withiu its consideration in the committee room. The opportnnity was provided by the British Dynamite Co., and the scene of the experimeut was the park of Sir Gilbert Eest, abont four miles beyond Maidenheed.

Ont of a small leather bag, which the company were concerned to learn had accompanied them in the carraige ou their journey down from London, Mr. Downie produced a few handsful of cartridges, which, on being opened, were showu to contain a light brown, earthy substance. This was the terrible dynamite, the "giant powder," as the Americans call it. Standing upon the root of the tree, Mr. Dowuie proceeded, with easy confideoce, to demonstrate that dynamite was ou the whole a pleasant thing rather than otherwise to carry about with him in a leather bag on railway journeys. The theory upon which legislation has hitherto proceeded is that, supposing an accident were to befall a train carrying a few hundredweight of dynamite, the train, the passengers, and the nearest railway station would be distribnted promiscuously through space, consequent upon the explosion by concussion of the dynamite. It is, on the contrary, alleged that dynamite will not explode except in two ways, one being by concussion between iron and irou, and the other by the detonatien of a cap.

In proof of this Mr. Dowuie, taking ont a cartridge and laying it on the stump of the tree, swnng a sledge hammer round his head and prepared to strike. "It will just smash up like a bit of paste," said Mr. Downie. There was an uneasy feeling prevalent among the little group of hon. members and others standing around the stump that this was a very ssfe assertion to make. Supposing that the innocent-looking roll nf paper peecefnlly collapsed under the blow of the hemmer, Mr. Downie wonld have been justified. But supnosing, on the other hand, the test failed, and the dynamite exploded, he wonld be equally sefe from contradiction by any who stood around the tree. The prediction was, however, happily fulfilled. The hammer fell heavily on the cartridge and flattened it into the appearance of a cake. Other cartridges were hnrled against the stump, and being thus brokeu opeu had lighted matches applied to them, at touch of which they harmlessly went away. The immunity from danger by ordiuary accideut having beeu thus demoustrated, a series of experimeuts were carried out with the view of showing the snormons power of the explosives wheu properly directed. A couple of holes were bored in the sides of the tree stump, and a dozeu cartridges being inserted and fired by the fuse, the gnarled and knotted root, full five ft. in diameter, was rent in twaiu, the wreck being lifted a foot or two ont of the ground. The two stumps of trees being disposed of, half-a-dozen cartridges, tied together and conuected with a fuse, were thrown to tbe bottom of a pond, shaded by a clump of trees that bent together. the topmost trees 200 ft. above the level of the pool. Half a minute later a loud report was heard, and the water, snddenly upheaving, leaped in a mnddy fountain thrice the height of the loftiest leaf on tbe trees. Finally, an ancient bonlder, weighing abont half a tou, which had beeu fonnd in one of the neighboring fields, and had defied the tooth of chisel and the blow of hammer, was attacked. Six cartridges, containing a trifle less than two onnces of dynamite a-piece, were laid ou the top of the stoue and covered with a sod. The fuse was lit, the cartridge exploded, and when the compeny re-assembled from behind the trees and banks, whither, pending the issue of the experimeut, they hed retired in skirmishing order, the boulder was found split into a soore of pieces. This concluded the experiments.—*Colliery Guardian.*

REPRESENTATIVE.—Takeu as a whole the present Feir is a showing of the lateut skill, industry and taste of the Stete with which she has every reason to be gratified. Tbe design of making it tboroughly representative of California industry is being well carried out. Those who have watched the snccessive exhibitions of a similar charecter in this city, remark the great superiority of the present Fair and ell its predecessors in the matter of prominence of home over foreign industry. This feature is one that has grown steadily since the first exhibition, and gives the best possible evidence of the progress the State is makiug in indnstrial pursuits. The degree of advancement reached, as evidenced by the exhibition, is exceedingly hopeful, and will certainly stimulate our people to still greater energy in their respective industries. This exhibition proves that in not a few branches we have fully caught up with many of the older communities of the Eastern States.

Two wine merchants from Bordeaux, France, have applied for apace at the Ceoteonial Exhibition. One has expressed an intention of exhibiting 50 differeot brands of Bordeaux wines. This is a good chance for California wine men to set up their bottles for comparison.

Real estate to the value of $340,000,000 in the cities of New York and Brooklyn alone is free from tax because it belongs to religious and charitable institutions.

Scientific Progress.

A Laboratory Experiment, and What Came of it.

Sir Humphrey Davy, profiting by the results of Lavoisier's experiments, investigated the nature of flame, and communicated the results of his study to a large audience gathered to hear him. Among other things he demonstrated that it was possible to produce a flame which, at a very high temperature, contained either free oxygen or unburnt carbon; that a large grate, with a limited supply of fuel, would generate the former, while a small grate, abundantly supplied with fuel, would give a flame devoid of oxygen, but in which combustible substances might be melted without fear of consuming them. Probably many of his hearers thought that while this discovery was very interesting, it was of small practical importance, and not worth the trouble of finding it out—not so all of them. In the audience was a young man named Cort, for whom these remarks had an especial interest. Up to that time the conversion of cast iron into malleable iron was effected by melting the pig metal with charcoal, and exposing it to a blast of air. By this process only small quantities were produced at a time, and the iron thus made was costly, even in the days of cheap charcoal. It was impossible to obtain the same results by the use of mineral coal, as the sulphur it contained would render the iron unfit for use. So the problem of cheap and abundant wrought iron remained unsolved until Cort, from the facts presented by Davy in his lecture, caught the idea of decarbonizing pig iron by allowing the flame to play upon it without bringing the metal into contact with the coal. Profiting by the idea he devised the puddling furnace.

This invention gave us iron at a price which rendered possible its use in large quantities as a material of construction, and as a consequence we have railroads spanning continents, and radiating in vast and complex systems from the centers of trade. Where would be our modern systems of rapid and cheap transportation if we had not the rails? Where the rails if we had not the puddling furnace? Where the puddling furnace if we had no knowledge of the nature and properties of flame? Whence that knowledge had the element oxygen remained unknown? Thus we trace back through the principal events which mark the stages of its development, one line of progress beginning with Dr. Priestly's experiment with a handful of red oxide of mercury, and ending in the greatest triumphs of engineering, which were alone rendered possible by our knowledge of how to produce iron in any quantity needed at a cost which has enabled us within thirty years to build and equip 70,000 miles of railroad. With these facts in mind we can appreciate the justice of the gentle protest entered by the great Tyndall at the close of his series of lectures in this city, against the so-called practical spirit of the age, which meets the scientific investigator at every step with the question, Of what benefit are your discoveries? The question cannot be answered, for the benefits of every discovery are incalculable. Instead of thus discouraging scientific progress, let us rather encourage it by every means in our power, and honor those who discover nature's hidden secrets for the good which, though we cannot estimate it in advance, must certainly result to mankind from any contribution to the sum of human knowledge, however small and unimportant it may seem.—*Iron Age.*

Blue Sky and White Clouds.—The ethereal blue color of the sky is due to minute particles of matter which float in the air. Were these particles removed, the appearance of the sky would be deep black. It is a fact in optics that exceedingly fine portions of matter disperse or scatter the blue rays of light, coarser portions scatter all the rays, making white light. The atmosphere is full of aqueous vapor, the particles of which diffuse white light in all directions. When these particles are enlarged, they become visible in the form of clouds. The vapor particles of the white clouds are supposed to be finer and lighter than those of the dark colonds. That the diffusion of light in our atmosphere, the blue coloring of the sky and the colors of the clouds, are due to the presence of matter floating in the air, has been conclusively proven by Tyndall. On passing a beam of sunlight through a glass tube, the beam is rendered brilliantly visible by the reflection of light from the dust particles floating in the air contained in the tube. But on removing the dust particles, which is done by filtering the air by cotton wool, or causing the air to pass over a flame, the beam of light is no longer visible in the tube.—*Ex.*

When tinned sheet-iron—technically termed tin plate—is washed over with a mixture of three parts of hydrochloric acid and one part of nitric acid, diluted with three parts of water, and then cleansed with pure water, there will be observed a peculiar somewhat mother-of-pearl-like appearance, due to the crystalline particles of tin, produced by the rapid cooling reflecting the light unequally.

The man who has thoroughly mastered a scientific principle holds a key which opens many locks.—*Tyndall.*

Origin of the Diamond.

An ingenious theory is thus put forth by the *Scientific American:* A constant product of volcanic action, we know to be carbonic acid gas, which contains the basis of the diamond combined with oxygen—a gas capable of being liquefied by the pressure of a column of water less than fourteen hundred feet high, and the ancient South African Sea was several times that depth. We know that this same gas is frequently imprisoned in the soft mud of stagnant pools, where it lies unabsorbed, escaping as bubbles when the mud is disturbed. Is it not reasonable to assume that the less energetic discharge of this gas from the heated depths below the sea beds might be stopped in the muddy filling of the vents, where, liquefied by the pressure of the superincumbent water, it might remain until deprived of its oxygen by some process of Nature's chemistry, leaving the free carbon to crystallize as the sparkling gem so eagerly sought for by the miner?

This, of course, is a mere hypothesis, for we know of no process by which the oxygen could be so withdrawn; but in every other respect the supposition is based on known conditions, and there is apparently no other way in which the raw material of the diamond could be so readily distributed in crystallizable condition throughout these natural diamond factories. The matrix in which the diamonds are found is unquestionably of aqueous origin; and we know, from the vegetables and other substances found enclosed by diamonds, that they could have been formed only in the presence of water. The two seem, therefore, to be contemporaneous.

It is a well known fact also that diamonds sometimes contain cavities enclosing a transparent liquid. We have seen it stated, but are not sure of the authority, that diamonds of this sort have been broken and their contents found to be carbonic acid; a fact which, if true, would add materially to this new theory of their formation.

Fulminates.

In a paper read before the Polytechnic Club of the American Institute, Dr. Fenghtwanger said: The fulminates are, compounds of cyanogen and some metals, such as mercury and silver, used as explosive compounds. The fulminate of mercury, which is so largely employed for the manufacture of percussion caps, is prepared by the action of alcohol upon a solution of mercury, in excess of nitric acid, and care must be taken to avoid an explosion. The fulminate is separated during this process in fine needle-like crystals. Moderate friction or percussion will cause the same to detonate violently, it is therefore usually preserved in a wet state with about one-fifth its weight of water. For the use of fulminate of mercury in the cap-composition it is mixed with nitrate or chlorate of potash. The oxidizing property of these salts is preferable to insure the ignition of the cartridge. Chlorate of potash and powdered glass are generally added to increase the sensibility of the mixture to explosion by percussion.

Fulminate of silver is prepared in a manner similar to that of mercury, but its explosive properties are far more violent, and can only be prepared in small quantities; but the pyrotechnists consume much fulminating silver in the manufacture of torpedoes. Their method is to dissolve ten grains of pure silver in a liquid consisting of 1¼ drachms of strong nitric acid and 1 drachm of water at a gentle heat, and as soon as it is dissolved ¼ ounce of alcohol is added and the fulminate of silver will soon be deposited in minute needles. They may be washed and dried very cautiously and kept in small quantities in paper. The violence of its explosion renders it useless for percussion caps.

Effect of Low Temperature on Metals.—As the result of a long series of experiments on the effect of low temperature in changing the strength of metals, Professor Thurston concludes that the practical result of the whole investigation is that iron and copper, and probably other metals, do not lose their power of sustaining "dead" loads at low temperatures; but that they do lose, to a very serious extent, their power of sustaining shocks or resisting sharp blows, and that the factor of safety in structures need not be increased in the former case, where exposed to severe cold is apprehended; but that machinery, rails, and other constructions which are to resist shocks, should have large factors of safety, and should be most carefully protected, if possible, from changes of temperature.

According to A. Fricke an emulsion of fat with water is obtained by shaking them together in a glass vessel whose sides are moistened with water slightly alkaline. Such an emulsion saponifies without heat, by mixing with an excess of caustic soda solution of 20° B. and stirring. On standing over night the soap collects as a cake on the top.

New Rubber Product.—Mr. John Mackintosh, whose name has become in England a synonym for a water-proof coat, has patented a process for mixing carbon with india-rubber in a peculiar way, and claims that the product is better adapted for a variety of uses in the arts than any compound before known.

It has been shown by Carius that, contrary to the views held by chemists, ozone is absorbed unchanged and in considerable quantity by water.

Mechanical Progress.

Boiler Explosions no Mystery.

Mr. McMurtrie recently delivered a lecture in New York, in which he gave a succinct and very intelligent account of the principal of the many known causes of explosions, showing that they were all very simple and very easily understood, and that the mystery of steam boiler explosions arose merely from a difficulty in determining, from the scanty and usually conflicting evidence presented, to which of the known causes the disaster should be ascribed, rather than from the existence of any mystery in the nature of the cause itself.

It was stated that, out of thousands of cases of explosions which had been examined by experts, but a limited number, which might be counted on the ends of the fingers, were still involved in uncertainty as to cause; and even in these cases, the evident difficulty was insufficiency of testimony.

Neglect of boilers which required repair, ignorance of the proper methods of management, defective safety valves and other appurtenances, and the innumerable other causes arising from gross faults in those having boilers in charge, were shown to be invariably chargeable with the terrible loss of life and property annually produced by explosions.

The character of these several classes of defects in the boilers themselves, and in their management, was plainly shown to be easily comprehended by average intelligence, and the fact was impressed upon the audience that in no case was the phenomenon involved in mystery. In every example, where it has been possible to obtain reliable evidence, it has been found that the cause was readily ascertainable; and it was also found that the cause, when determined, was perfectly simple and readily comprehended by any well informed person.

It was shown that, in all cases where there existed any apparent mystery, it had been found that evidence was lacking, and that, where the disaster was due to well known causes, no reliable testimony was obtainable to reveal it.

It was therefore concluded that, whenever one of these so "accidents" occurs, it is the duty of those charged with its investigation to take the fact to be *prima facie* evidence of the criminality of some one, and to devote their attention to the detection of the criminal.

If there appears to exist no evidence revealing wrong doing, and although the testimony presented may seem to preclude the assignment of any known and probable cause, it is still to be concluded that the mystery does not attach to the conscience of the accident itself, but to those causes which conspire to hide its origin. The greatest apparent mysteries are often found, after long and almost discouraging investigation, to be explainable by absurdly simple trains of circumstances.

Economic Consumption of Smoke.—The operation, at Glasgow, of patent self-stoking smokeless furnace, which is, perhaps, a little better known in England than in Scotland, is thus spoken of in the Glasgow *Herald.* It meets the case more thoroughly than any invention of a similar kind that has hitherto come under notice, and is as simple in construction as it is efficient in operation. The coal is placed in a hopper, over the front part of the furnace, into which it drops in small quantities through a couple of apertures. It is not necessary to open the front door of the furnace, except to see how the fire is getting on, for by a simple mechanical re-adjustment the man in charge of the furnace may regulate the quantity almost to an ounce. As it is added to from above, the coal sinks down, and slides slowly until it reaches the bars from the bottom of the furnace. These bars are acted upon by plungers, which carry them forward together, with their layer of cold on the top, and then, an eccentric being applied, every third bar in the series is brought back to receive a fresh supply. In this systematic and continuous way the furnace is fed with coal, which passes right through in slow and easy stages, the same quantity of fuel being at all times in exactly the same state. Combustion is, therefore, perfect; the smoke is burnt up, and the waste fuel is discharged, in the form of clinker or slag, into the ash-pit.

Smallest Locomotive.—In an English journal, some three years ago, was an illustration of the "wee" locomotive "Topsy." It has 1⅜-in. cylinders and 1⅞-in. stroke, the coupled wheels being 4 in. in diameter. The weight of the engine, empty, is 54 lbs., or, say half a hundred weight. In steam the weight is 60 lbs. The "Topsy" drawe a lode of eight little trucks up the line (which has an average inclination of 1 in 16, with a maximum gradient of 1 in 11, and there is one curve of 9 ft. radius), and in all respects conducts itself with the propriety of engines of larger growth. Discussion as to the comparative size of locomotives, big and little, brings this little giant again into notice.

It is estimated that the projected tunnel beneath the English channel could be driven and completely fitted up in five or six years, and at a cost of from $40,000,000 to $50,000,000.

Making iron in peat-burning furnaces among the Lake Superior mines is a success.

More improved portable fire-extinguishers are added to the list every day.

A New Calculating Machine.

A short time ago (says a contemporary) we saw in the Reliance Machine Works, Philadelphia, a wonderful little mathematical machine, which was being manufactured in that establishment. There is nothing remarkable in the appearance of the machine, but there is in the result it achieves. It will add, subtract, multiply, divide, and, in fact, perform almost any arithmetical operation with perfect accuracy and perfect ease of management. It might be made of special service to politicians in office, for it understands "addition, division, and silence." As an example of rapid computation, recently before the Franklin Institute, the inventor, Mr. F. S. Baldwin, set up a multiplicand, consisting of eight places of figures and a multiplier, also composed of eight places, and performed the multiplication in a minute and a-half. The operator has simply to turn a crank. For instance, suppose the unit figure in the multiplier to be eight, the operator turns the crank eight times, then moves the multiplying gear one place to the left. The partial product is shown complete at each turn. The machine also proves its work by reversing the operation and turning the crank backwards until the starting point is reached. If correct, the product will then show a row of noughts. The machine has been used by a prominent railroad company for several weeks, and in a number of long computations has not made a single mistake, but has detected several mistakes in their prepared arithmetical tables.

Fire-proof Construction.—It must be strongly asserted, that, before a building can be fire-proof, it should be heat-proof, and that no building with any exposed metal forming an essential part of its construction can be so designated truthfully. Wherever iron is used, it should be protected either by good brick-work, sound plastering, or, if nothing better can be found for the purpose, solid wood-work round it. Wood-work, if really sound and solid, will resist for almost any length of time every possible effect of heat short of actual flame; even when flame has reached it, it is by no means destroyed at once, but, on the contrary, is sometimes found to last for hours; and wood protected on its under side by proper plastering, which will not fall down or crack on the application of heat, seems to be a powerful resister of flame. It is probably to the scamping now so common that we owe the diminishing use of timber as a material for the construction of buildings designed to carry heavy loads. Let this scamping only cease, let everything be as it represents itself to be, and either wood or some other heat-proof substance will be found to occupy a much more prominent part in the construction of our buildings than it does or ought to do at present.—*Builder.*

At the tests of artillery in Boston harbor, for the purposes of experimental tests, there were provided two guns of 25 tons each, and of 15-inch caliber. One of them was the common smooth bore, and the other was rifled in accordance with Mr. Wiard's invention, but in other respects there was no difference whatever. One hundred and forty pounds of powder, the largest quantity of ammunition ever used in a gun, was fired from each, and the projectiles were respectively of 460 pounds weight. The targets consisted of wrought iron plates of 15 inches in thickness, and they were erected side by side, 150 feet distant. The rifle projectile fired from the Wiard gun was of conical shape, and the one fired from the common smooth bore piece was necessarily round. The one first named went through the 15-inch plate and out of sight into a sand bank in the rear. The demolition of the almost invulnerable target was complete, and so great was the force with which it was struck that a fragment of 300 or 400 pounds was thrown clear across the island, a distance of not less than a quarter of a mile. The projectile from the smooth bore gun penetrated the target only about six and a-half inches.

Hay Cutters.—A Missourian has patented an invention which consists in improving hay and straw cutters by the application thereto of a grinding plate that takes up the wear on the knife as fast as it occurs, a peculiar support for the cutter blade, and also novel means for operating the feed roll. These are said to cause the machine to operate with less labor and to cut the hay or straw more uniformly than is usual.

Still Another.—Car couplings are still the rage. A promising arrangement is described as an improved automatic car coupling, wherein the coupling pin is held up by a slide until the drawheads of two cars come into collision, and are automatically coupled, the object being to relieve car couplers from the usual peril of their occupation.

Phosphosue Bronze.—Some of the brands will bear a considerably greater breaking strain than steel itself. It appears, also, to be suitable for sheathing ships, since, when immersed in sea water, it loses scarcely more than one-third as much as is lost by the best sheet copper.

It is proposed to tunnel Mont St. Bernard. The whole work will cost about $12,000,000; the tunnel alone, $3,400,000.

Moulds for casting steel, having spring sides to allow for the expansion and contraction of the metal, have been introduced.

Much ingenuity is expended in perfecting apparatus for automatically supplying locomotives with water.

Mining Stocks.

Mining stocks went up very strong until Monday afternoon, when they broke badly. The stocks in mines in outside districts are looking up a little notwithstanding the depression in other quarters. The *Enterprise* in speaking of the low prices says: There are occasional slight movements up and down, but they possess no special significance. About all that any one can feel sure of is that they cannot go much lower. When they are likely to make a permanent rise no one can say; but all have a feeling that the time for such a rise is not far distant, and those who have money to invest are beginning to look about for a good place in which to put it. At each little rise these people become nervous and fear they may have waited just a little too long, and not a few purchase a few shares of something to have a finger in the pie in case it shall turn out that the big rise has indeed begun. Of course it is rather provoking to find stocks settling back again in a day or two, but none of those who have purchased at any of the figures which have ruled of late are likely to lose in the long run. The work of prospecting is being vigorously pushed in all the mines, both great and small, along the Comstock range, and in most instances the explorations made have resulted in the development of favorable indications if not in paying ore. Those mines which have been long flooded with water are at present nearly all clear again and getting in shape to resume work in their shafts and on their lower levels.

The "watering" of mining stocks is again in order, as several companies have called special meetings for this purpose. The Woodville Mining Co. notified its stockholders that a meeting of the company will be held on the 28th of September to take into consideration and decide upon a proposition to increase the capital stock from $2,800,000, divided into 28,000 shares, se at present, to $6,000,000, divided into 60,000 shares.

The Best & Belcher Co. have called a meeting to take into consideration the proposition to increase the capital stock from $2,240,000, in 22,400 shares, to $10,080,000 in 100,800.

The Exchequer Mining Co. propose to increase the capital stock from $2,400,000, or 8,000 shares of the par value of $300 each, to $10,000,000, or 100,000 shares of $100 each.

A Gold Hill paper says the recent attempt to increase the stock of the Yellow Jacket mine from 24,000 to 96,000 shares fell through for want of a sufficient representation of stock at the meeting. It is quite probable that the project was defeated by the pending assessment. It is very pleasant, in the absence of a better dividend, to have one's shares multiplied by a majority resolution.

INJUNCTION DISSOLVED.—There was great rejoicing in Pioche, on Wednesday, on the reception of the news that the Supreme Court had dissolved the injunction granted by the District Court in the case of the Magnet Mining Co. vs. the Page and Panaca Silver Mining Co. The last named company were enjoined some two months from working upon and removing ore in their mine.

A WELL defined ledge of silver ore is said to have been discovered in Pope valley, about 20 miles northeast of Calistoga. The work of prospecting is rapidly progressing.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

DIAMOND GOLD MINING CO.—August 20. Location: Grass Valley mining district, Nevada county. Directors: H. O. Howard, John O. Hanecom, J. K. Cooper, Rodger O'Donnell and John G. Jonee. Capital stock, $1,000,000.

NORTHERN BELLE MILL AND MINING CO.—Aug. 21. Location: Columbia Mining district, Nevada. Directors: J. C. Bateman, A. J. Holmes, B. P. Hazeltine, H. H. Allen and J. H. Beait. Capital stock, $5,000,000.

DEXTER WIND-MILL CO.—Aug. 24. Trustees: H. F. Shepardson, A. H. Southwick, Wm. Weighd, H. H. Johneon and A. S. Moore. Capital stock, $45,000.

GEYSER QUICKSILVER MINING CO.—Aug. 26. Location: Sonoma county. Trustees: Geo. W. Gilbert, J. C. Wilmerding, E. B. Mott, Jr. and Mosss S. Friedberg. Capital, stock, $6,000.000, in 60,000 shares.

MERCURY QUICKSILVER MINING CO.—Aug. 24. Truetcee: Geo. W. Gilbert, Robert Hamilton, Moscs S. Friedberg, S. P. Boswell and A. H. Rutherford. Capital stock, $6,000,000, in 60,000 shares.

The following named Company has filed a certificate of incorporation in the office of the Secrstary of State at Sacramento:

GOLDEN SULPHURET MINING CO.—Place of business: Sonora, California. Capital stock, $450,000, in shares of $100 each.

THE Oro quartz mine near Oroville, has tnrned out 250 tons of ore during the past three years. A tunnel is now being run to tap the vein 600 feet below the croppings. When the tunnel ie finished the company intend to run a mill by water power, as they have water enough to run 100 stamps. The tunnel ie now in 250 feet and it is expected that they will tap two other veins. There ie also another ledge on the bank of the river (near the mill) which ie six feet wide. The contractor who ie running the tnnnel is using s drill propelled by water power, with a pressure of about 300 ft. acting on an 18-inch wbeel. With this machine holes can be bored in any direction.

CORNUCOPIA, Nevada, is a comparatively new camp which attracted considerable attention last year. A correspondent writes ne from there that the mines are good, bnt that s mill is much needed because the ore could be worked at Cornucopia at less expense than by freighting it to the mille already built at Winnemucca and Mountain City, as is being done now. The district is surrounded by agricnltural and pasture land.

THE LAVA BEDS.—The mines known as the "Lava Bede" near Oroville, give employment to about 4,000 Chinamen. Sbafts have been and are being snnk in several placee, one being 85 feet deep. The stratnm of gravel runs a dietance of 12 miles and there is plenty of water, from Feather river; water can also be obtained by sinking from eight to twenty feet.

W. E. DARBY, an expert, sent from this city to examine the supposed coal lands in Santa Cruz county, reports that he failed to obeerve anything either by croppings or in the tnnnels which would, in hie judgment, indicate a true coal measure, and thinks it useless to continue the prospecting tnnnels.

A GREATER amonnt of prospecting is going on in the western part of Nevada this season, says the Virginia *Chronicle*, than ie generally supposed. It is not confined to s search after silver-bearing ledges, bnt coal, cobalt, borax and quicksilver are sought for, and some valuable mines have been discovered.

THE Tnnckee *Republican* states that 68 car loads of steel rails have alresdy arrived there from the East this season, and 192 more are yet to come. This will make a total of 2,000 tons of steel raile for this seasone. These rails are to be nsed between Truckee and Blue cañon and will supersede the present iron rail.

GOOD progress is being made in the erection of the heavy foundation walls of the large new mill of the Consolidated Virginia mining company. The principal walls are about completed; bnt there is much heavy etone-work yet to be done about the fonndation of the batteries and engines.

TIMES are lively, in a mining point of view, in the Jesus Maria district, Calaveras county. Two mills are in operation—one on the Austrian and another at the old Whisky Side mine. The work of development ie progressing favorably on a number of promieing ledgee.

OWING to a recent break in the Amador canal, near the West Point bridge, the watsr has not yet reached the distribnting reservoir. If no accidents happen, however, the water will probably be through by the first of September.

THE mines at Anbnrn district, Baker county, Oregon, are proving more favorable than they ever have heretofore, new ones being opened that will last and pay better than any gronnd ever discovered in Oregon.

THE end of the litigation in the Ophir case leaves the superintendence of the mine still in the hands of Samnel T. Cnrtis. No work is being done at preeent npon the 1,700-foot level, on acconnt of bad ventilation.

THE Humboldt Agricnltnral, Mining and Mechanical Society have decided to hold the next county fair at Winnemncca, on the 12th, 13th and 14th of next October.

THE last ore taken from the New York gold mine, near Grass valley, yielded $35.79 per ton. This mine has alresdy produced upwards of $500,000.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALAMEDA COUNTY.

COAL.—Livermore *Enterprise*, August 22: Parties are making preparations to prospect the newly discovered coal vein on the Redwood road. The present prospects give fair indications of a good body of coal. The H. A. Coal Mining Company are contracting to sink 100 ft. further on their present shaft. The indications for striking the main body are sufficient to warrant the undertaking. The company are erecting houses near the mine, and making such other permanent improvements as are necessary.

AMADOR COUNTY.

AMADOR CANAL.—*Ledger*, August 22: The water is being carefully conducted through the canal to the distributing reservoir, and will reach that point in a few days.

FAOM VOLCANO.—Quartz interests are looking up, and will doubtless give a new impulse to quartz mining in the neighborhood. There has been recently several small lots crushed taken from lodes in the vicinity, all of which have yielded from $40 to $45 per ton. Griesbach & Co. struck a very rich quartz vein up Sutter creek, about four miles above town, a few days ago, the rock from which, by ordinary process, paid $45 per ton. George Story had a crushing from his lead which returned $40 per ton. Rodgers & Co have struck another very rich lode, from which they took about 90 tons of rock and had the same crushed, and which yielded the sum of $3,000. The Placer mines, on Union Flat, sold a short time since by T. Sorocco to Booth & Co., of San Francisco, are proving to be very valuable mining grounds and yielding well.

BUTTE COUNTY.

DUTCH HILL MINES.—*Record*, Aug. 22: D. D. Harris and John Wayland returned this week from a visit to the Big meadows. While there they visited and inspected the Dutch hill mines. Very little work is being done at present on account of a scarcity of iron for tubing. As a 400-ton consignment is arriving here and Aldersly has commenced shipping it over the mountains to Dutch hill, the probabilities are that work will soon be resumed.

CALAVERAS COUNTY.

ZACATERO.—*Chronicle*, Aug. 22: The Zacatero quartz mine at West Point has made a splendid commencement. The first clean-up of the new mill, after a run of eight days, yielded $7,000. Some idea of the exceeding richness of the rock can be formed when it is considered that the battery is composed of but 10 stamps.

NEWS from the Gwinn mine is most cheering. In the 900-ft. level pay ore was struck 100 ft. nearer the shaft than before, and the rock is very rich.

EL DORADO COUNTY.

RICHER THAN EVER. — *Mountain Democrat*, Aug. 22: Since the crushing works have closed down on the Saint Lawrence mine, underground operations have been continued to the running of a contract drift on the 800-ft. level to the northward of the shaft. Last week, in timbering this drift at a point 140 ft. north from the shaft, the contractors cut into quartz at the bottom, in widening to make a footing for their timbers, and found ore which is estimated to be good for a yield of $100 per ton. They cut into this fine ore about 18 in., but as they are running straight ahead, on a contract, they are not authorized to prospect the width and condition of the ledge at this point.

GEORGETOWN. — *Republican*, Aug. 20: The California Water Co. are driving ahead with their works, and expect to complete them this fall, and then it is believed that all who want water can be supplied. The company have a large force in constant employ, and Supt. McKnsick is kept as busy as a man well can be to run things to the best advantage. We saw at the water company's office, which is in charge of J. H. Miller, several specimens that were taken from claims in which the company is interested, that were very tempting, among them a couple of nuggets of several ounces each, and several very handsome specimens of quartz, bearing gold to over half their weight. The Woodside is engaging more attention than any other mine about those parts. This mine is only a few rods from the very center of the business portion of the town, and has just got in working trim, since machinery for pumping and hoisting was put in. The shaft is down 130 ft., and the water had just been got out when we were there. This mine paid well a few years ago, and it is generally believed that with the machinery now employed, which is all new and of the best, the mine will prove the greatest success of any mine in the country.

THE Mansfield mine, a short distance from St. Lawrence, J. L. Smith, Supt., is looking exceedingly well, and negotiations are now in progress for the erection of a mill.

HUMBOLDT COUNTY.

RYE PATCH. — *Register*, Aug. 21: The Rye Patch Mill and Mining company have reduced the force in their mine at Rye Patch, to 12 men. The mill is kept running on tailings.

IT is reported that Sol. Kunkel discovered a valuable mine, last week, in the mountains south of the Humboldt house.

INYO COUNTY.

STRUCK IT.—*Independent*, Aug. 18: The ledge for which Supt. Wingard has been running his tunnel on the Virginia Consolidated was struck Thursday last, and at a depth of 200 feet from the surface. The vein rock is loose and requires timbering before the ledge can be cut through to determine its thickness; and this work has been done at once, but enough is developed to know that that the ledge is large and the whole prospect very satisfactory.

PIUTE DISTRICT. — Francisco Gonzales and two other men came down from the Bishop creek district, Thursday, bringing with them some particularly rich gold rock from a new ledge recently struck. A Mr. Johnson had purchased a half interest in the discovery claim, having paid $4,000 for it, and is now gone to San Francisco to procure the machinery for a five-stamp mill, to be erected and put to work on this ore immediately. Griswold & Co.'s arrastra was running steadily.

PANAMINT —Henry Jones says he will have a 20-stamp mill running there in less than 100 days. The machinery for the Jacobs' mill was all on the ground. The toll road, recently washed out, is in repair again.

KERN COUNTY.

MOUNTAIN CORRESPONDENCE.—Cor. *Southern Californian*, August 20: A week ago Graham and others unearthed a ledge near the Howe property from which they took six tons and crushed it, which yielded the sum of $621. The last crushing of Mr. P. Murphy agreeably surprised him; he cleaned up $4,000 from 120 tons of Venus. The more the Summer mine is developed the better it shows. It is the leviathan mine of the county. In many places it is 30 ft. across the vein. Hoisting works, which will cost $100,000, are now being put up. The managers are opening the mine to correspond with the 80-stamp mill which is in course of construction. Sageland is looking better than ever. Here is a mine nearly on the edge of the desert, getting richer below the depth of 600 feet than at the surface, which effectually explodes the theory that deep and permanent veins exist only at the top of large mountains. Piute is running on good ore, with two years' work in sight.

MARIPOSA COUNTY.

COULTERVILLE MINES.—Cor. *Gazette*, Aug. 21: The Kate Kearney has a vein of good size, 4 ft. thick, with well defined walls of good formation, showing a true vein. The ore is very regular, prospecting about the same from all parts of the vein. The Baodaretta mine the Goodwin B others took hundreds of thousands of dollars from, and it is still keeping up its lick. The day I was there they were smelting their bullion into bars. They had 25 lbs. of pure gold, weighed on butcher's scales, being the result of 100 tons' crushing. The Hasloe is running to its full capacity, on good ore, and from former runs there is no doubt as to the result. The machinery about this mine is all new and of the best quality—all works smooth, and is of sufficient strength to work the mine to an indefinite depth.

MENDOCINO COUNTY.

IRON DISCOVERY.—*Democrat*, Aug. 22: Report has it that an iron lead has been discovered near Ukiah, but a few miles off, near Gobbi's Soda spring. Our informant says it was supposed to be a continuation of that near Cloverdale.

NEVADA COUNTY.

OMAHA.—*Transcript*, Aug. 20: A clean-up of 25 tons of rock from the Omaha mine, was made at the Larrimer mill on Monday. The product was 70 ozs. of amalgam, or about $22 to the ton of rock. This was a much larger result than was anticipated. More of the same quality of rock is being hauled from the mine to the mill, preparatory to another crushing. Work at the mine continues, and the ledge is increasing in size.

MINING.—Men have all been at work during the summer. Not an idle man could be found who desired to work. They have been in the mines taking out the gold which will be in circulation during the winter.

OCCIDENTAL.—The machinery of the Banner mine was purchased and is being put in position at the mine, and we understand will soon be in running order. The ledge at the Occidental is large.

MINING NOTES. — *Transcript*, August 20: The North Bloomfield company will soon have their mine opened, and if the yield shall bear any comparison to the outlay in opening it, will greatly swell the proceeds of the county next year. The mines at Moore's Flat will all be worked next year when the Milton ditch is built to that place. The mines in Little York township never looked as well as they do today, and it will exceed anything ever taken out there heretofore. All the mines in this vicinity are very prosperous. The Manzanita hydraulic mine, near this city, has yielded bountifully this season, and has proved itself much better than its owners anticipated. The quartz mines are all at work and doing well. Machinery has been put up on several new ledges and the prospects justify the outlay which has been made on them.

NEVADA.—*Transcript*, August 22: The rock continues to increase in richness. So soon as the water is more plenty the returns from the mine will greatly exceed anything heretofore taken out.

DEEP DOWN. — *Tidings*, August 22: The shaft of the Eureka mine in this place is expected to reach the point at which its 1,300-ft. level will be established this week. A drift will at once be run to tap the ledge (the incline does not follow the variations in pitch of the ledge,) when the all-important question of the future of this mine—great, even if now abandoned—should be determined.

THE Perrin and the O'Connor mines are being negotiated.

THE mines in Little York township, it is said, are looking better than ever before, and very heavy results are looked for from next year's run. The hoisting works of the Webster mine, near Randolph Flat, were burned to the ground a few days since. Damage, $2,000.

PLACER COUNTY.

STONE COAL.—*Herald*, Aug. 22: We were shown a piece of what had the appearance of hard glistening stone coal, found a few miles northeast of Auburn. This coal was submitted to experts here, who at once pronounced it the best quality of stone coal. It was tested in a blacksmith's forge in our presence, and burned as well as the best. These specimens are supposed to come from cropping of a large ledge, not yet found.

GOLD RUN.—The old Cedar shaft, on which there has been so much labor and capital expended, has at last been put down to bedrock; the result is $6 to the pan, and ground enough to last 20 years, the gravel deposit being about three-quarters of a mile wide, by four miles long, with an average depth of 200 ft. The water has "gin out" at this place for the season, and all the claims have shut down in consequence. This season has been a good one for claim owners, most of whom have reaped a good harvest. There will be another branch tunnel (from the big one) which is intended to tap the Cedar ground some 60 ft. below the bottom of the shaft; when that is accomplished look out for lively times.

PLUMAS COUNTY.

CLAYBANK CLAIM.—*National*, Aug. 22: The drift is in bedrock, the top showing the "old-fashioned" quartz gravel, which prospects better every foot they make towards the main channel.

CONLY & GOWELL.—About six acres have been stripped this year, but only one-half of the bedrock cleaned, as the water gave out three or four weeks sooner than was expected. Their large flume is 6,000 ft. in length, and part of that distance has a grade of only four inches to 16 ft. The present year's work has uncovered a large basin which has proved a very rich part of the claim. The amount cleaned up has been large and $100,000 would not be much above the figures.

SAN LUIS OBISPO COUNTY.

RINCONADA.—*Tribune*, Aug. 22: A few days after this claim was bonded a rich deposit was struck, which will undoubtedly prove the most extensive in the county. We have a specimen of the ore on our table which excels any specimens we have yet seen in that line. We are assured that there are tons upon tons of the same class, lying open to view, which they think will average 50 per cent. all through.

WE understand that a valuable asphaltum mine has been discovered and is now in successful operation, on a tract of land recently sold to Frenchmen. Large quantities have been taken out and it is pronounced by experts to be of the very best quality. A contract has been made with a party for the hauling of fifty tons to the landing, to be shipped to San Francisco.

SANTA BARBARA COUNTY.

TUNNEL.—*Press*, Aug. 18: There is a rumor of an "enterprise of great pith and moment," no less a project than the boring through the Santa Ynez mountains, to make a passage for water to the mines, and also for the transmission of ore to this city.

SIERRA COUNTY.

GRAVEL. — *Mountain Messenger*, Aug. 18: Kuder & Co. have struck fine gravel in their mine at Saddle-back. They raised a shaft 50 ft. from their tunnel and tapped a fine looking bed of river boulders and washed gravel. They think they are on the rim of the channel only.

GOOD PAY.—Philo Haven is reported to have struck very rich diggings at Gold Lake, having taken out 60 or 70 ozs. in three days last week. We trust the report is correct.

MILL.—Clough & Co. will immediately proceed to build a five-stamp mill on their ledge near Rock creek. They intend to have it running before winter.

SISKIYOU COUNTY.

GOOD CLAIM ON THE KLAMATH. — *Yreka Union*, Aug. 22: We learn that Miller and the Mott boys have struck excellent pay in their claim on the bar on the Klamath river, opposite the mouth of Horse creek. Report says they are taking out from 6 to 7 ozs. a day, with but four or five hands at work.

OAK BAR.—Reports from Oak Bar are of a very favorable character. The claim of Clever, Delaney & Co., which paid so well last year and the year previous, is said to be paying well again.

SOLANO COUNTY.

BROWNLIE MINE.—Vallejo *Chronicle*, August 22: The Brownlie mine will start up its furnaces within a few days. It has now 200 tons of fine ore on the dump and will therefore be able to put a goodly quantity of quicksilver on the market after commencing operations. Workmen are now engaged in erecting a housing over the trestle-work track leading from the dump to the furnace.

SONOMA COUNTY.

PHŒNIX.—Napa *Register*, August 22: Sixteen flasks quicksilver came down from the Phœnix last week, and 12 more were received yesterday. Mr. Fellows, the superintendent, came down yesterday, and reports everything as going on well, the product being about 70 to 80 flasks per month. The water bursting out from some hidden reservoir, still continues to flow, though with diminished volume. 20 flasks quicksilver from the California to-day.

TRINITY COUNTY.

TRINITY-CENTRA. — *Journal*, Aug. 22: The Cinnabar mine is in full blast. The retorts were got up some weeks ago, and the ore was there ready and waiting for them.

THE McGillivray D. & H. M. Co. have done a great deal of work in the way of fitting up their mines. Extensive bed-rock ditches have been run and new flumes put in at a large expense. At a recent clean-up, however, enough was taken out to pay all expenses to date, and left a margin to go on.

SMILEY, at Douglas city, stripped 180,000 ft. of bed-rock the past season. We learn that $22,000 was the amount taken out.

TULARE COUNTY.

PORTEAVILLE.—Cor. *Delta*, Aug. 22: Mr. McCaslin of this place, who has been absent on a prospecting tour for the last two months, returned a few days ago to get a new supply of provisions, and tools to work with. Reports finding a gravel bed about eight feet in depth at the point of discovery; and that it dips back into the hill, and rests on a decomposed bedrock. Mac is an old placer miner, and he says he thinks that it will pay well to work it; he panned out some, and says that it pays about two bits to the pan in fine gold.

TUOLUMNE COUNTY.

MINES.—*Independent*, Aug. 22: The Table Mountain Alpha company are still running on the channel—prospects fair. The superintendent has expressed himself as well satisfied with the favorable indications. A party of experts have started for the Summit silver mines.

Nevada.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Aug. 21: Ore breasts on the 1,300-ft. level are yielding finely as usual, and look more promising than ever. The ore stopes on the 1,465-ft. level are also looking well and are yielding excellent ore. The Empire State mill is kept steadily running on ore from the mine, while at the same time there is a steady accumulation of ore in the dumps.

SAVAGE.—Sinking the main incline below the 2,000-ft. level is making rapid progress, the rock in the bottom working finely. The main south drift on the 2000-ft. level has reached the south line and has been discontinued for the present.

GOULD & CURRY.—Sinking the double incline winze below the 1,700-ft. level is making steady progress. It is now down 188 feet below that level, the bottom still in vein matter. There is some little water coming in, yet not enough to at all impede the progress of the works.

CON. VIRGINIA.—Daily yield 300 tons of ore The ore breasts both north and south on the 1,300-ft. level are yielding finely. The ore stopes on the 1,400-ft. level never looked better than at present. The north winze from the 1,400 to connect with the south drift on the 1,500-ft. level is down 97 ft. Work on the new mill is making steady and as rapid progress as the nature of the rock will admit of.

BELCHER.—Daily yield, 450 tons of ore. The ore breasts on the 1,300, 1,200 and 1,000-ft. levels are all looking well and yielding finely, as usual. Sinking the new air shaft is being pushed with all the vigor possible, the bottom being in fair running ground.

WOODVILLE.—A strike was made in the north drift, on the 200-ft. level, and appears to be an entirely new and very rich discovery. While running that drift an apparently cross ledge was struck, which has been drifted on 20 ft. in a southwesterly and 20 ft. in a northeasterly direction, both drifts running the entire in fine ore. A winze has also been started, which is down 12 ft., and is still in good ore.

CROWN POINT.—Daily yield, 500 tons of ore. This ore is being mostly extracted from the 1,000, 1,300 and 1,400-ft. levels. The ore stopes and breasts on all of these levels are looking well, and promise a fine yield for months to come. The new machinery is all working splendidly, and the future looking bright and prosperous.

HALE & NORCROSS —The main west crosscut from the incline on the 2,000-ft. level has cut a number of streaks and spots of fine ore, but nothing that will pay for extraction or reduction. Daily yield, 50 tons of ore, which is being extracted from the old upper levels.

CHOLLAR-POTOSI.—Daily yield, 80 tons of ore. This ore is being extracted from the stopes on the old upper levels. Its assay value is $30 per ton.

A COMPANY of seven old experienced California miners from Marysville, Cal., are now engaged in putting in a flume near Auburn, Baker county, Oregon, that cannot be excelled by any in the State, commencing near Powder river, on Mill creek, takes in Quacomas, Ohio, French and Hogeye gulches, and when finished will be about three miles in length and three and a half feet wide, three feet deep, and the bottom lined with rock 12 inches thick.

BLACK HILLS.—A large meeting of old miners and others was held at Sioux City, on Tuesday. They organized an expedition to Black Hills. Two hundred and fifty names were enrolled, and it is understood the party will move in conjunction with others forming at different points on the frontier.

The Fair as an Educator and Elevator.

One of the most important and suggestive paragraphs in the excellent opening spsech, pronounced on Tuesday by Col. Barnes, was his reference to the present social and political status of the farmer and mechanic—so changed from what it has been in years gone by. In alluding to the fact of the present great uprising among the indnstrial classes throughout the country, he remarked that, "the coming years will see destroyed whatever they deem hostile to their material interest and established by their consenting judgment, whatever may seem for their advancement. That state will be the wisest, safest, and happiest which gives to them such knowledge of the real principles of economic and mechanical science as shall guide, if it cannot control, their policy and direct their aims, and, while enabling them to sweep away their disabilities and wrongs, shall not suffer them to march under those early inspirations of uneducated liberty to an uncertain and ruinous goal." One of the most effectual means of thus controlling this newly developed element, and directing into healthy and legitimate chaunels the growing power of the industrial classes, is just such exhibitions as that which has now been inaugurated in this city. From the commencement of the industrial exhibition epoch the profound significnce and value of snch exhibitions have come to be more and more realized by both peoples and governments everywhere. Their beneficent influences are many and wide-spread; they advance hnman knowledge in every direction, and more than anything else serve to bring together, in friendly counsel and social converse, the heretofore too much antsgonised elements of capital and labor. Through the universal language of the products of labor, the artisans of various sections hold communication, not only with each other, but as well, also, with that clsss of the community which more especially represents the moneyed interests, the relations between which and labor constitute the great aud vital problem of the day. By the friendly greetings and words interchanged on the common platform of the exhibition room, ancient prejudices are broken down; unfriendly olass elements are fraternized; generous rivalries in the peaceful field of industry are excited, and a better understanding is fostered between labor and capitsl.

It is gratifying to note the increased interest which all portions of the community are taking in these exhibitions, planned more especially in the interests of the mass of the people. They cannot be otherwise than largely promotive of both the material and moral welfare of the community, while they serve to give a more just appreciation of ths true dignity of labor, and its paramount claims on the consideration of all as the sole basis of national wealth and power.

It is largely to the influence of these exhibitions, which have become so popular in this city, that our people have been educated up to so fully see the need of a great industrisl school of srt in our midst, and the gratification of which laudable wish has recently been so fully placed within our reach by the timely and munificent bequest of our distinguished fellow oitizen, James Lick. Let us hope, with the orator of Tuesday, thst the foundation thus laid will be hnilded on and strengthened until it shall give to our own State, at least, a race of skillful, theoretical and practical mechanics, whose labors shall bring honor and profit to the land of their birth.

Complaint Against Alfalfa.

The *Utah Mining Press* contains an acoount of the death of a valuable horse, which was supposed to have been caused by eating lncerne or alfalfa. The lucerne had been cut and partially dried, and the animal, it is probable, had been deprived of all green or fresh-cut feed to an extent that induced excessive eating. The case excited some interest in the neighborhood, as it was the first complaint heard against alfalfa as feed. It should not, however, create any distrnst of this valuable food. We have known a good many cases in which borses, and cattle also, have been seriously injured under similar circnmstances, and some where the result was fatsl. Animals when first "turned out" in spring are very apt to be injnred by over-eating; bnt the most serious cases are those where horses or cattle have broken into gsrdens, grain fields or meadows, even. It is generslly during the short feed of midsummer that these hungry raids occur, and animals often remain several hours in these tempting spots; gorging themselves and suffering, as a consequence, hoven or bloat. Probably the case mentioned above was one of these. We have known of alfalfa having been fed on Eastern farms for a term of several years, and have never heard of any injurious effects following. In changing from stable-feeding to grass, cattle and horaes should not be allowed to fill their stomachs at first, but should have a slight feed each day until fully accustomsd to it; and if plenty of salt is accessible it will lessen the danger of bloating, and perhaps save the lives of valuable animals.

Bazaine annoys the French officials by writing letters to them.

Pretty Rich Rock.

We all know that California, as a mining country, can't bs beat; but soms parts of the State have not received due credit for richnsss of rock. It is not the fault of newspapers, either, for some of them tell pretty hig yarns of these respective localities. If any of our interior contemporaries can "top over" the following, from the Trinity conuty *Journal*, the editor had better form a partnership with Mark Twain and writs a book: "George M. Grover, of Junction city, has been to Bullychoop and returned fully satisfied that the quartz of that section is the "biggest thing in the State." Billy Wsldorff and Grover packed a mule with 150 pounds of the rock, in gunny-sacks, to Indian Creek. The friction occasionsd by the motion of the mule causing the pieces of rock to rnb together wore them somewhat, and a small qnantity of the dust thus msde was found in the sacks after the rock wss taken out. Shaking this into a pan. George panned it out and obtained $6 10. Thinking the Junction city boys would like some specimens, George pnt a few pieces of the rock in his pockets and carried them home. Of course these wore away some, and emptying the dust from his pockets into a pan, he washed out $3 20. Since then George hss discovered that there were holes in his pants' pockets, and some of the dust must have gone through. At last accounts he was engaged in shaking the dust out of his boots, and expected to realize $1 30. It is but fair to state that Grover says the rock brought away was the poorest that could be fonnd. We have known Mr. Grover intimately for a long time; he is a native American, and not in the least given to exaggeration; still, where more than one of our readers live in ths same house, and the story appears to them to be a little large, they can divide it among themselves, each taking as mnch as he thinks he can stand."

For Croakers.

One having all long held the faith that California has in her the making of a msnufacturing State must derive great enjoyment in walking up and down the aisles of the Pavilion and seeing the rapid advance made since the last Fair. Per contra, the constitutionsl Croaker, whose natural hopelessness of disposition and carping manner have made him and his class a nuisance for years past, must feel that his prophecy department needs re-organizing.

The increase in qnantity and quality of home manufactured articles is exceedingly gratifying, and the quiet way in which the progress has been made indicates a healthy and continuous energy among our people. Despite the perpetual moan about the high price of labor and the scarcity of fuel, California, as the present exhibition indicates, is going ahead in manufactures, at a rate which, with the constantly increasing momentum of accomplished results, will, before many years, give her fair rank in the list of manufacturing States.

Plumas County Mines.—The *Quincy National* says: By a working test during the past fifteen years it has been demonstrated that one of the best paying gravel leads in this county is that which includes Gopher, Badger and Shores' Hill, Curtis Point, Wahponsee creek, Pine Leaf and Quien Sabe ravines. A more clearly defined, extensive and better-paying deposit of gravel cannot bs found in the State. A large portion of the ground on the line of the snpposed "old channel" is located or claimed, but, owing to the want of means and the scarcity and high price of water, only a few, comparatively, of the claims have been opened and fitted up for systematic and profitable working. It usually requires a large outlay of money to open a claim and fit it np with all the improvements now considered necessary for hydraulic mines; and unless the original locators, who, as a general thing, are unable to bear the expense, can induce men with capital to assist them, the claims will remsin undeveloped. Such is the case along the lead above referred to. Less than two years ago Garland & Dow purchased a set of claims in Quien Sabs, and have since located and applied for a patent to eighty acres of mineral land on the main lead; they have been at work ever since the purchase, and have succeeded in fitting up the claim in good shape. They have put in abont 1,200 feet of flume, dug a ditch which gives them between 200 and 300 feet pressure, set up iron pipe, hydraulic chief, and all necessary improvements for a first-class claim. The ditch takes water from the ravine, and will in ordinary seasons supply them with three month's run of water, and the Spanish ranch ditch, which runs just above their own ditch, can supply an abundance of water for a much longer period. They have a splendid bank of gravel, which prospects well.

A Good Disinfectant.—A reliable home-made disinfectant may be prepared as follows: Dissolve a quart of salt in a gallon of water, and with the salt water slack a half peck of lime, which should be wet enough to form a kind of paste. For the purpose of a disinfectant, this home-made chloride of lime is nearly as good as that purchased at the shops and drug stores. Use it freely about sinks, cellars, gutters and out-houses, and in this way prevent sickness, suffering and expense.

Daniel O'Connell, the journalist, has returned to this city.

Deep Sea Soundings in the Pacific.

Capt. Belknap, commanding Unitsd Statss steamship "Tuscarora," engaged in deep sea sounding in the Pacific, in a report datsd Hakodadi, Japsn, June 26, 1874, gives an interesting and valuable account of his recent soundings. It will be remembered that Commander Belknap first ran a course of soundings from Puget Sound to San Diego, thence to Yokohama *via* the Sandwich Islands. It was his intention to return on the line of the great circle passing through the Island of Tanogo, of the Aleutian group, and towards Puget Sound. He left Yokohama, on his return voyage, on the 8th of July at daylight, and next morning began sounding homeward. When about 100 miles east by south from King Kassen, or Senda Bay, on the east coast of Japan, the lead sank to a depth of 3,427 fathoms, showing a descent of 1,504 fathoms in a run of 30 miles. This result seemed extraordinary at so short a distance from the land, but the next cast of the lead revealed a depth still more astonishing, the sinker carrying the wire down 4,643 fathoms without reaching bottom. On this occasion, when some 200 fathoms of wire had run out, the sinker was suddenly swept under the ship's bottom by a strong undercurrent, and all efforts to get the wire clear and prevent it from tending underneath were unavailing; the difficulty being increased by a fresh wind and a moderately heavy sea. Finally, when 4,643 fathoms of wire had run out, and only about 150 fathoms were left on the reel, it broke close to the surface and about five miles were lost. After this experience Commodore Belknap concluded that the current of the Japan stream would prove too strong for a light of eight miles of telegraph cable, and perhaps render the process of laying the cable impossible. He therefore ran back in shore in order to skirt the stream, and beyond it start out again on the new great circle of Point Komala. In latitude 40° north on this new line he found very deep water; at one cast of the sinker it reached a depth of 4,655 fathoms, with but a slight current. The conditions under which these latter deep casts were made were favorable; the wind was east, the sea smooth, the swell remarkably slight for the Pacific, and the ship was quiet.

Robinson District.

During the week, says the *White Pine News*, we have met several gentlemen from Mineral City and Nevada district, and all concur in the opinion that at last the district is showing unmistakable signs of "coming out" the present season. The mill of the Watson company is being run constantly on ores from the Portland and Sumner mines, and the shipments of bullion illustrate the fact of a steady production of the precious metal. Although somewhat base, as yet, in its character, it still works well by the milling process. It is anticipated, as depth is attained, that the character of the ore will change from its present condition to a more free description, which will he all the better for the district.

The new furnace lately erected under the supervision of James Montgomery, for the Canton mining company, is moving along finely, its product exceeding the most sanguine expectations of all. Superintendent Walsh is highly and justly pleased with the result, as on its successful working rests the real future of the district. It is said that two new furnaces will soon be commenced there, which will be but the pioneers of many others. It is a matter for congratulation that Judge Walsh had the wisdom to employ only the most competent men in the erection of his furnace and the manipulation of ores, as much of serious and permanent harm is often done by egotism and self-sufficient estimate of talent. Montgomery says the ores smelt with much greater facility than those at Eureka, and, being abundant, no doubt can possibly exist as to the prominent place to be occupied by Robinson district in the near future.

The Ward-Ellis Consolidated Co. have purchased several valuable locations containing large bodies of smelting ores, which will necessitate the speedy erection of other reduction works, thus adding to the general prosperity. All residents are jubilant over the outlook, and we congratulate them on their perseverance and pluck in holding on so well and so long.

Pacific Mill and Mining Company.—A New Incorporation.—Mackay, Fair, Flood, O'Brien and others have just incorporated all of their mines and mills under the above name. They incorporated under the laws of California, and their certificate was filed for record in the office of the County Recorder of Storey county, August 8th. The business of the company, as set forth in their certificate, will be the mining of precious metals and the reduction of gold and silver-bearing ores. The capital stock is $8,000,000, divided into 80,000 shares of $100 each; principal place of business, San Francisco, the company to remain in existence 50 years. The Trustees are: W. S. O'Brien, J. C. Flood, James G Fair, John W. Mackay and Edward Barron. The incorporation embraces the Consolidated Virginia mines and mills, of which the parties above mentioned have control.—*Virginia Enterprise.*

The revival of the whipping-post, as a cure for "morbid impulse," is called for by the Troy *Times*.

Spain is doing a great deal of fighting for its size just now.

Original Gold Hill.

The ground of the Original Gold Hill Gold and Silver Mining Co., situated immediately adjoining the most noted mines of Gold Hill proper, is ons of the oldest locations along the section of the Comstock. The claim was located in 1861, and considerable work was done tnward its development. A shaft was sunk tn the depth of 330 feet, and at the 220-foot level a fine body of ore was found, but it was of too low a grade to psy, owing to the great cost of milling; therefore, after considerable prospecting about for richer ore, the company was obliged to suspend operations. Since then the claim has been allowed to lie idle, until within the last yesr; it falling into other hands, work was resumed under far more favorable auspices, the reduced price of milling giving a good margin for profits, and the present company being oomposed of men of capital, energy and ability. They have been retimbering and repairing the shaft, and having prospected the ore deposits to their satisfaction they feel warranted in going to the expense of erecting new and efficient steam hoisting works, the hoisting having heretofore been done by means of a hand windlass and a whim. They have thoroughly perfected the title to their mine, which certainly is one of the very best and most valuable locations, and the assessment recently collected not only paid all costs, but left money enough in the treasury to defray all possible expenses for the next three or four months to come, independent of ore production.

The new hoisting works are situated over the mouth of the shaft, about half way between the American Flat and Ophir toll grades, and the engine and machinery are of sufficient power to work the mine to a depth of 700 feet. The fonndations are solid and everything is of the most substantial character. The platform nr floor for the main bnilding is strongly built of heavy timbers, with three-inch plank flooring. The bnilding, which will soon be np, is to be 60 feet long by 32 wide. The shaft consists of three compartments, each four and a-half hy four feet in the clear. It is one of the best shafts along the lead, and is fitted with first-rate cages and all the reqnisite applianoes. Under the energetic direction of Mr. Scott, the foreman, a vast amonnt of very effective work has been done during the psst month, and the new hoisting works started into operation day before yesterday. This morning the clearing ont of the debris at the bottom of the shaft was completed, and some water encountered. Water, however, cannot interfere with deeper sinking, as the whole grnnnd is drained by the much deeper mines near by. The company dn not propose sinking the shaft deeper at present, but will open a new level from the bottom of it, 100 feet below their present working level already opened. This 100 feet is all new, unprospected ground, and valuable ore developments will nndoubtedly be msde in it. Meanwhile, they propose, as soon as properly prepared tn do so, to take ont ore frnm the 220-foot level for milling. J. C. Corey, late of the Ophir mine, is Snperintendent; and the prospects for the Original Gold Hill may safely be laid down as very flattering.—*News.*

A Singular Geological Freak.

In the bottom of the main shaft of the Virginia City Coal Company, El Dorado cañon, Lyon county, has been encountsred the trunk of a large tree four feet in diameter—a lone relic of an ancient and extinct forest. Where cut throngh by the shaft this old tree is fonnd to be perfectly carbonized, turned into coal. Outside the old log is completely crusted over with iron pyrites, many of which are so bright that the crystals shine like diamonds. These crystals also extend into the body of the log, filling what were once cracks or windsbakes, and even forming clusters abont what once was the heart of the tree. This relic of an old time forest lies far helow the two veins of coal the company are abont to open. The finding of this old trunk is evidence that the country was at some time, ages and ages ago, covered by a forest of large trees; thongh the native timber growth, when the country was first visited by the whites, and as far back as the traditions of the Indians extend, was bnt a scrubby species of nut pine. A few miles from the shaft in which this carbonized tree was found are to be seen on the surface the petrified remains of many large trees. In the early days of Washoe, but the prospectors had broken them np for specimens, pieces of tree-trunks two or three feet in diameter, and twenty or thirty feet in length were to be seen lying npon the surface of the gronnd. However these trees and even the one fonnd in the bottom of the shaft of the coal mine, may have come from the foothills of the Sierra mountains—may have drifted out when seas of water everywhere covered our present valleys. The water lines on the hills show that the whole country was filled with lakes, and the petrified trees lying here and there on the snrface of the ground probably floated out on the water of the extinct lakes, and finally sank to the bottom in the places where they are now fonnd.—*Virginia Enterprise.*

Woodward has discontinued the late cars on the Mission street line. Quarter past twelve is the last.

Fifty tons of fruit—five car loads—were forwarded eastward from Sacramento on Wednesday.

Vallejo's face is swollen with the mumps.

Useful Information.

Salt in the Seas.

Many people imagine that the ocean water is naturally salt, and will be surprised to know that the salt comes from rocks, and is washed into the sea.

The sea depends on the disintegration of rocks on land for its saltness. It does not originate in oceans and seas. Rains wash it and hold it in solution as particles are liberated by violence, decomposition and gradual action of many natural forces. All streamlets and rivers, therefore, are constantly transporting salt to the sea. If there is more than can be held in solution, then it accumulates in masses at very deep points, which, in the revolution to which matter is subject, may again be a stratum of salt somewhere remote from where the mass was found. Thus the salt mines of Portland, and the vast horizontal beds of pure salt in Texas, as well as that mountain of rock salt in St. Domingo, were collected at the bottom of ancient seas, which are now dry land, remote from water.

There are places in Africa where the process of disintegration of salt from rock is regularly going on, but there is not water-power enough to force it onward to the sea. Hence the particles are spread abroad and mixed with the soil. The negroes of Northern Africa having discovered its distribution where there is no water to dissolve in the ground, leach it. In that way they separate the salt. By evaporating the water holding it in solution, an excellent article for domestic purposes is produced. Salt pervades the earth. It exists in the grasses and most vegetable products on which animals feed. In that way they derive enough in most countries to meet the demands of their natures. They require as much as civilized humanity. With them salt is necessary, as with ourselves, for keeping the organs of vision in good condition. Stop the supply, and blindness would ensue.—*Ex.*

Mud Spots on Varnish.—On this subject the *Carriage Monthly* remarks: High grade finishing varnishes, whether of English or American makes, possess their wearing qualities from the simple fact that they retain their elasticity or oily principle to a great length of time. The surface hardens sufficiently to resist dust and to admit of being washed, but the body of the varnish remains soft and sensitive, and must allowed to dry on the surface of the varnish both stains it and extracts by capillary attraction the oil contained in the varnish. Each spot of mud, according to its size and shape, acts on the varnish immediately under it, but no further; from the fact that a suction is created by the evaporation of the moisture contained in the mud. Different kinds of soil act with more or less injurious effects. Sandy soil would have but a slight effect on a varnish which would be badly stained by more adhesive clayey soil, and the filth of a large city would be still more fatal to the gloss of the varnish.

Protecting Composition.—In answer to a correspondent, who asks how to make a composition for coloring and preserving gates, roofs and timber generally from the weather, the editor of the *American Builder* says: Melt 12 ounces of rosin in an iron pot or kettle; add three gallons of train oil and three or four rolls of brimstone; when they are melted and become thin, add as much Spanish brown (or red or yellow ochre, or any other color you like, ground, as usual, with oil) as will give the whole the shade wanted. Then lay it on with a brush, as hot and as thin as you can. Some days after the first coat is dried, lay on a second.

An Amusing Chemical Experiment.—Place five glasses in a row, then pour into the first a solution of potassium, the second a solution of corrosive sublimate, the third a small quantity of iodide of potassium and some oxalate of ammonium, the fourth a solution of chloride of calcium, and the fifth some sulphide of ammonium. Now pour parts of the contents of the first glass to the second, and a scarlet color will be obtained; next pour the second into the third, and the mixture will be colorless; again, pour the third into the fourth, and the contents will be white; finally, pour the fourth into the fifth, and the mass will be a dense black. Then you will have had two glasses of colorless, one scarlet, one white and one black.—*Ex.*

Desilverino. — It is sometimes needful to know how to dissolve silver without attacking copper, brass, or German silver, so as to remove the silver from silvered objects, plated ware, etc. A liquid for the purpose is simply a mixture of one part of nitric acid with six parts of sulphuric, heated in a water-bath to 100 deg. F., at which temperature it operates best. By this means the old silver attached to plated ware, old daguerreotype plates, etc., may be removed and saved without any necessity for wasting acids in dissolving a large amount of useless metals.—*Jour of Chem.*

Substitute for Ground Glass.—To half an ounce of white, hard varnish add two ounces of methylated spirit. Shake well up, and allow it to settle for an hour or two. Clean very carefully the plate of glass, and coat with the varnish. When dry, a semi-opaque film of exquisite fineness will be left on the glass, which answers well.—*Artisan.*

Learn to Forge Your Own Tools.

The following sensible advice is from the Newark *Manufacturer*: Many mechanics have an idea that after they have mastered the more legitimate duties of the workshop they have learned all that is necessary, and can undertake anything in their line of business. Machinists particularly are prone to this error—a common one, by the way—and think that a knowledge of fitting and turning, once acquired, makes up for all other deficiencies. In reality, the self-styled finished mechanic is, paradoxically, the unfinished one; for he who acknowledges his shortcomings, and tries to correct them by obtaining all the information he can, will acquire a more thorough knowledge of his profession. Comparatively few machinists are competent to dress their own tools, or, indeed, handle the blacksmith's hammer on any work. How many times such knowledge would have been invaluable, we leave individuals to decide from their own experience. A simple weld, which they were unable to make, a faculty for dressing chisels without putting their own eyes in danger by striking the anvil instead of the tool, would assuredly have stood persons, ignorant of such details, in good service in time of need. Apprentices who go to the tool dresser to have the edges of their chisels or other instruments renewed, will do well to observe the process and inform themselves of it, instead of throwing coal at the helpers, or otherwise conducting themselves in an unruly manner. Observation and experience are twins, and no youth, or, indeed, any adult can hope to attain eminence or proficiency without paying some attention to the matters herein alluded to.

Cleaning Kid Gloves.—During the warm weather, kid gloves are easily soiled, particularly as the prevailing colors are quite light; and as it costs time and money to have them cleaned at the dyer's, we let our readers into the secret of cleaning them at home, which can be done just as well as if paid for outside. Take a little sweet milk and a piece of white or brown soap. Fold a clean towel three or four times, spread it over your dress, and spread out the glove smoothly upon it. Take a large piece of white flannel, dip it into the milk, then rub it upon the soap, and rub the glove downwards toward the fingers, holding the wrist of it by the left hand. Continue this process until the glove, if white, looks a dingy yellow, but if colored, looks dark and entirely spoiled. Now let it dry, and then put it on your hand, and it will be soft, smooth, glossy, and clean. Take care, however, to omit no part of the glove in rubbing it, and see that all the soiled parts are thoroughly cleaned. This process applies only to white or colored kid gloves. For black gloves that are soiled, turned white, and otherwise injured, take a teaspoonful of salad oil, drop a few drops of ink into it, and rub it all over the glove with the tip of a feather, then let them dry in the sun. White kid boots and slippers can also be cleaned by the first process to look "as good as new," and black kid boots and slippers can be restored to their pristine gloss by the latter method.—*Ex.*

Indestructible Paint.—One of the conditions most to be desired, and chiefly aimed at in the production of matter in certain forms, is indestructibility, and any material, either for constructive or decorative purposes, fulfilling this condition must inevitably meet with favor. In the natural order of things it would take a very long time—eternity, in fact—to prove the presence of this quality in any substance claiming to possess it. The application of tests, however, with a limited term of use may enable a fair conclusion to be arrived at, thus dispensing to some extent with the element time.

Cement for Attaching Labels to Metals.—Take 10 parts tragacanth mucilage, 10 parts honey and one part flour. The flour appears to hasten the drying and renders it less susceptible to damp. Another cement that will resist the damp still better, but will not adhere, if the surface is greasy, is made by boiling together two parts of shellac, one part borax and 16 parts water. Flour paste, to which a certain proportion of sulphuric acid has been added, makes a lasting cement, but the acid often acts upon the metals.

Rose colored Stain for Wood. — Monnier recommends steeping the wood for several hours in a bath of 1,200 grains iodide of potassium to the quart of water, and then immersing it in a bath of 375 grains of corrosive sublimate, when it will assume a beautiful rose-red color by chemical precipitation. It should subsequently be covered with a glossy varnish. The baths will not need renewal for a long time.

Babbitt Metal consists of 24 to 96 parts of Banca tin, eight of antimony and four of copper. This alloy of 24 parts of tin, eight of antimony and four of copper is called hardening; for lining the boxes 72 parts more tin is added, or simpler, one part of the hardening alloy melted with two parts of Banca tin.

Dim writing, nearly effaced by age, may be restored by the application of a solution of prussiate of potash of water. Wash the parts with a hair pencil, and the writing will appear if the paper has not been destroyed.

Blacking brass is simply done by plunging the brass object for a very short time into nitric acid, and then into the fire, when the acid evaporates and leaves the dead black, well adhering film of oxide of copper behind.

Good Health.

Iodized Albumen.—M. Collas, in the *Bulletin General de Therapeutique*, describes a new process for the administration of iodine. Alcoholic solution has been found too irritant in many cases, and as the iodine acts on the alcohol, forming a hydriodic ether, the tincture is liable to vary in its composition. Iodide of starch has been recommended, but this preparation is of variable strength, and has besides an unpleasant taste. Iodized albumen, M. Collas considers, obviates all these inconveniences, and can, without much difficulty, be formed into pills. The albumen is prepared by agitating actively an albuminous solution with iodine in very fine powder or in solution in some appropriate vehicle. The mixture is at first highly colored, blackish-brown, but this color gradually disappears in several hours of contact, and the preparation no longer strikes the violet color with starch. The product is then dessicated under gentle heat in an air bath, when it may be made into pilular mass. The dose is so arranged that each pill shall contain 5 milligrammes of iodine. The experiments by Professor Dolbean have shown that iodine thus prepared has no bad effects whatever. It may be continued for several weeks without stomach trouble or other inconvenience.

Recovery from Wound of the Brain.—Dr. R. F. Baldwin, in the *Richmond and Louisville Medical Journal*, adds another to the list of cases in which recovery has occurred after severe wound of the brain. A lad 16 years old was accidentally wounded by the discharge of a pistol in the hands of a companion a few feet distant. Upon receiving the shot the boy fell with violence, but did not lose consciousness. The ball, about the size of a buckshot, entered the right frontal bone an inch above the center of the eyebrow, and, passing through the brain, lodged in the occipital bone near the center of the occipital cross. A silver probe passed by its own weight to the center of the brain without touching the ball. As a precautionary measure he was bled, and Epsom salts were administered. The wound healed rapidly without any constitutional disturbance, and in 10 days he returned to his home. He is still living in good health, and has never suffered the slightest inconvenience from the accident.

Cure for Rattlesnake Bites.—In view of the numerous cases of rattlesnake bites being almost daily reported by the interior press, the following recipe from the Trinity *Journal* may prove of some benefit: A physician in Texas was recently bitten by a rattlesnake, and, in order to test the efficacy of iodine as a remedy, he waited until the swelling in his leg and the pain compelled him to lie down—about 20 minutes after being bitten—when he took half a teaspoonful of saturated tincture of iodine, repeating the dose in diminished quantities, at intervals of 15 minutes for an hour. He also applied the tincture to the wounds and the whole surface of the swollen leg; and in five hours the pain had so far subsided that he fell asleep and slept several hours. On waking, he was entirely free from pain, though his leg was fearfully swollen and tender to the touch. He used no other remedies, and in a few days was entirely well.

Cure for Burns.—Comte de la Tour du Pui publishes the following for the benefit of the world at large. He says that a pretty strong solution of ammonia in water is an excellent remedy for burns in cases where the skin is not destroyed, and as "much trouble doth environ those who meddle with *hot* iron," our readers are peculiarly interested in such remedies. The count says, that having by accident taken hold of a crucible which was nearly red hot, he suffered great pain, plunged his hand into some ammoniacal water, and kept it some hours afterwards covered with a piece of linen soaked in the same; the pain was allayed almost immediately, and no blisters or suppuration occurred.

Lemon Juice as a Local Application in Diphtheria.—In the clinical lecture by M. Bucquoy he expresses his preference for lemon juice, as a local application in diphtheria, to acids, chlorate of potash, nitrate of silver, perchloride of iron, alum or lime water. He uses it by dipping a little plug of cotton wool, twisted around a wire, in the juice, and pressing it against the diseased surface four or five times daily.

To Conceal Bad Tastes of Medicines.—The bitter taste of quinia, colocynth, aloes, quassia and other bitter medicines is said to be instantly removed by chewing a piece of licorice root. To disguise castor oil rub two drops oil of cinnamon with an ounce of glycerin, and add an ounce of castor oil. Children will take it and ask for more.

Ether and Chloroform.—We are able to say that in the present state of science the medical man is responsible for every case of death occasioned by the application of ether, because a careful watching of the respiration is capable of preventing death, while the lethal effect of chloroform depends in part on individual predisposition, which the physician is unable to recognize.—*Schiff.*

The Butte *Record* says that saleratus, applied immediately, is a sure cure for tarantula and scorpion bites.

An Artificial Face.

At a recent meeting of the Medical Society of London, a member, Dr. Hutchinson, exhibited a patient who had lost a large portion of his face by disease, and to whom the deficiency was supplied by artificial means in a way similar to that by which some of our dentists treat loss of palate, nose, etc.

The disease had resulted in the destruction of the superior maxilla, all the spongy bones, and also of the soft parts, including the nose, some of the cheek, the upper lip, and nearly all the soft palate. A rhino-plastic operation being deemed impracticable, the case was treated mechanically. To supply the lost parts internally an apparatus was constructed of vulcanite, bearing mineral teeth, which articulated with those of the lower jaw, and this was held in position by the vulcanite being adapted to the whole of the inner surface of the nasal fossæ, thus affording a hold by means of suction. For the sake of lightness the whole of the apparatus was hollow, while the outer surface was coated with soft gutta-percha; the floor of the artificial piece formed the roof of the mouth. Mr. Hutchinson had also made an artificial nose of vulcanite. This was fixed to the man's face by an elastic band which passed round the head. The junction was partially hidden by means of a moustache fixed to the upper lip, which was also artificial. Mr. Hutchinson comments on the fact that the man's occupation (he was a mason) and his position in life compelled him to treat the case in the simplest manner possible. Various delicate improvements in the shade of color, mode of attachment, and usefulness of mastication, could be made in the case of persons in a higher sphere of life, who would appreciate delicacy of manipulation.

Camphor Medication.—Camphor is a poison, and yet it is largely used by many families for alleviating pain and curing sores. It is a nervous irritant. If taken in small doses, its acts like alcohol and opium. In large quantities, it excites the nervous system even to the extent of camphor spasms and death. Camphor also acts as an irritant on the mucous membrane of the stomach, leading to constipation and ulceration. On these accounts it should not be used without the advice of a physician. Families easily get into the habit of running to the camphor bottle for every trifling ailment, until after a while insidious maladies break out whose origin is little suspected.—*Journal of Health.*

Gurjun oil in Leprosy.—Dr. J. Dougall, of Port Blair, Andaman island, has published a report of his experience with gurjun oil in the treatment of leprosy. Of twenty-four cases under treatment during six months, he says that all have been decidedly benefited. The oil is administered internally in combination with lime-water, and is also applied externally to the affected parts. Gurjun oil is an oleo-resinous product of the *Dipterocarpus lævis* and other allied trees. Experiments with the new remedy are being made at the present time in London and elsewhere.

Croton-Chloral in Facial Neuralgia.—In *The British Medical Journal*, Dr. F. B. Lee reports the case of a lady, æt. 32, who had suffered for years from attacks of facial neuralgia, had had several teeth extracted, had been blistered behind the ears, and had tried numerous other means without avail. He prescribed croton-chloral in three-grain doses every four hours. After the third dose perfect ease was experienced, and although three months had elapsed, there had been no return of the disease.

Reason Why.—Nitrous oxide causes people to laugh who inhale it, because it introduces into the body more oxygen than can be consumed. It therefore deranges the nervous system, and, being a powerful stimulant, gives an unnatural activity to the nervous centers and brain. This derangement usually exhibits itself in a pleasurable excitement to those who inhale it—causing them to be merry, almost to insanity. It has therefore been called laughing gas.—*The Druggist.*

What Candy is Made of.—The New York *Mail* says candy-eaters are welcome to the appetizing information that terra alba (which is nothing but plaster of Paris or gypsum) glucus, lampblack, sulphuric acid, aniline, verdigris, Brunswick green, gamboge, smalt, ultramarine, oil turpentine, Prussic acid, rotten cheese, fusel oil, chrome yellow, and other drugs and compounds are largely used in the manufacture of cheap candies.

The beneficial effect of Alpine health resorts has been attributed to the greater abundance of ozone in the mountain air, and the theory is supported by recent investigations; but Dr. Haller, of Switzerland, says that though it seemed likely that as one ascended, an increase of ozone would be met with, yet at the highest accessible points there was no marked difference.

Diet in Erysipelas.—A very important department of the constitutional treatment is proper alimentation. A milk diet, with farinaceous pudding, rare cooked eggs, beef tea, then poultry and fish, will all in their proper place be useful, and assist much in promoting a speedy recovery.—*Pac. Med. Jour.*

Cod-Liver Oil in Consumption.—When the patient is losing health and strength the oil is serviceable. The most agreeable preparation to take will do the most good.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Tools; A Splendid Success; Sanitary Condition of the State, 129. A Good Feature at the Fair; Fruit Drying; An Interesting Mine Model; An Interesting Feature; Design Patents, 136. A Model Hydraulic Mine; Progress of Life; The Marysville Foundries; Our Sugar Interests, 137. Patents and Inventions, 140.

ILLUSTRATIONS.—Block Plane, No. 9½; Circular Plane, No. 13; Combined Plow, Filletster and Matching Plane, No. 41; Combined Dado, Filletster and Matching Plane, No. 46, 129. Progress of Life in Geological Ages: Inverted Siphon on Spring Valley Company's Property, 137.

CORRESPONDENCE.—The Stickeen Mines; Hurdy-Gurdy Water Wheels; Mining at Jonesborough, 130.

SCIENTIFIC PROGRESS.—A Laboratory Experiment, and What Came of It; Blue Sky and White Clouds; Origin of the Diamond; Fulminates; Effect of Low Temperature on Metals; New Rubber Product, 131.

MECHANICAL PROGRESS.—Boiler Explosions no Mystery; Economic Consumption of Smoke; Smallest Locomotive; A New Calculating Machine; Fire-proof Construction; Hay Cutters; Still Another; Phosphorus Bronze, 131.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 132.

MINING SUMMARY from various counties in California and Nevada, 132-3.

USEFUL INFORMATION.—Salt in the Seas; Mud Spots on Varnish; Protecting Composition; An Amusing Chemical Experiment; Desilvering; Substituts for Ground Glass; Learn to Forge Your Own Tools; Cleaning Kid Gloves; Indestructible Paint; Cement for Attaching Labels to Metals; Rose Colored Stain for Wood, 135.

GOOD HEALTH.—Iodized Albumen; Recovery from Wound of the Brain; Cure for Rattlesnake Bites; Cure for Burns; Lemon Juice as a Local Application in Diphtheria; To Conceal Bad Tastes of Medicines; Ether and Chloroform; An Artificial Face; Camphor Medication; Gurjun Oil in Leprosy; Croton Chloral in Facial Neuralgia; Reason Why; What Candy is Made Of; Diet in Erysipelas; Cod-liver Oil in Consumption, 135.

MISCELLANEOUS.—Forest City Mines; Coal; Experiments in Explosives; Representative, 130. The Fair as an Educator and Elevator; Complaint Against Alfalfa; Pretty Rich Rock; For Croakers; Plumas County Mines; A Good Disinfectant; Deep Sea Soundings in the Pacific; Robinson District; Pacific Mill and Mining Company—A New Incorporation; Original Gold Hill; A Singular Geological Freak, 134. Hydraulic Mines of the San Juan Range; Mining Enterprise; Blue Pigment of the Egyptians; Mining at Dutch Flat; The Calistoga Quicksilver Mines; The Deepest Well in the World, 138. Prospectus Compilation; A New Idea; Pine Flat Mines; Ascent of Mount Shasta—Remarkable Feat; A Good Education; Street Cleansing in New York, 139.

Design Patents.

But few persons understand the nature and value of a design patent, and many do not even know that our patent law has provided protection for works of taste, beauty and ornamentation. In many cases a design patent will serve a much better purpose than a trademark or even a mechanical patent. A mechanical patent is issued where the invention involves *utility* resulting from mechanical constructions and combinations, while a design patent secures to the inventor or designer the exclusive right to any design which involves ornamentation or beauty—something which is pleasing to the eye solely, without combining utility with it. The manufacturer who desires to establish a reputation for his products or articles, can easily ward off imitators by securing a suitable design which shall become known in connection with the articles which he manufactures. A trademark would certainly protect him if the purchasing public were studious and particular enough to bear in mind that the real article is sold under a special trademark, but as a general thing the public does not examine so closely into such matters, and are more apt to overlook a trademark than a peculiar shape or design upon the article, such marks more firmly imprint themselves upon the memory than mere trademarks. Another advantage in favor of a design patent is that it can be secured for the term of either three and a half, seven or fourteen years, as the applicant sees fit to demand, and the cost is graduated accordingly, being $30 for three and a half years, $40 for seven years, and $50 for fourteen years, including all fees and charges.

IRON has been discovered a few miles from Ukiah, Mendocino county.

Fruit Drying.

In our issue of August 8th, we described a machine for drying fruit which it was claimed had been "thrown open to the public" over twenty years ago. We do not understand, from the article, which was clipped from the *Horticulturist* and which we republished in the PRESS, that the machine was ever patented; but on the other hand we should judge that the writer meant that the invention was "thrown open to the public" by the fact of its being described and illustrated in a public journal. Since writing our previous article we have taken some pains to inquire into the merits of the various fruit-drying machines now offered to the public, and to learn the difference in treatment and the quality of the final product of the different machines.

The process of placing the fruit in a closed chamber like a stove oven, and then heating the air in the chamber until the fruit is dry, is not a dessicating process, practically speaking, but rather a baking of the fruit. A small quantity of the moisture in the fruit is taken up by the air in the oven, but as the air has no escape it soon becomes charged with water and a steam is generated in the oven, which partially cooks the fruit.

When the fruit is dried in kilns, which are distinguished from the oven process by the fact that the air has free access and exit to the fruit during the drying process, the fruit is liable to become burned or scorched by the heat before it is properly dried, as the organic moisture in the fruit is soon carried away by the heated air, especially if the temperature is not high enough to seal the outside of the fruit, so as to prevent the escape of the moisture; and the consequence is that if the fruit is not scorched it is shrivelled and dried so completely that it is tasteless and incapable of being restored to its original flavor.

The secret of drying fruit, so as to leave it in a thoroughly preserved condition, without detracting from its original quality, the inventor of the Alden process, which is now being introduced quite extensively upon this coast, claims to have discovered. Mr. Alden claims that, to properly preserve fruit and vegetables by drying, only a small portion of its moisture must be removed. The fixed moisture which is not removed but remains in the fruit, he asserts, can be so chemically combined with the constituent elements of the fruit and vegetables that its presence instead of being an objection is absolutely necessary to prevent the succulent properties from being destroyed. This combination is effected by exposing the fruit or vegetables to a gradually decreasing temperature and increasing moisture. For this discovery Alden secured his patent, and although he uses an upright furnace with a chain carrier similar to the one described as having been thrown open to the public over twenty years ago, his process could be carried out in almost any style of a furnace. In the old process it is evident that the fruit was carried from top to bottom of the stack or chamber. It is also evident that the heated air was admitted at the lower end of the chamber and passed out at the upper end. The fruit was therefore exposed in its passage down the stack to increasing heat, dryness and decreasing moisture, just the opposite of the process employed by Alden. The twenty-year-old process is therefore quite a different thing from Alden's. The apparatus, however, being old, can be used by all who desire to use it without infringing, as long as no patented improvement is added to it and as long as the old process is followed out.

The rationale of the Alden process is that when the fruit is subjected to the high degree of heat at the lower part of the chamber or stack, the heated air commences to eliminate the moisture, and is converted into steam. This steam, rising upward in the stack, envelops the fruit above so as to keep the pores of the fruit open, and thus permit the free water to escape while the remainder forms a component part of the fruit. Thus we see the difference between the Alden process and other processes which were previously in use. And if anything is needed to show us the superiority of the process, it is the excellence of the dried fruit produced by it.

Another fruit drier which is offered to the public, and which deserves especial mention, on account of its cheapness and great efficiency, is the American Fruit Drier, patented Nov. 12th, 1872. Mr. Ryder, the inventor of this machine, agrees with Alden, that the fruit should be subjected to the greatest heat at first, so as to seal its exterior, and be gradually moved towards a lower temperature; but, instead of keeping the fruit surrounded by the steam of the newly introduced fruit, or other moisture, he carries the steam off as soon as it leaves the fruit; thus moving the fruit towards both a decreasing moisture and a decreasing temperature. The operation is carried on in an inclined chamber, through the middle of which the fruit is conducted on trays. The heat is admitted to the under side of the fruit line from the furnace, and rises through the fruit to the space above it, where the current of hot air carries the moisture off through the upper end of the chamber, without allowing it to strike the fruit above the point where the steam is generated. The goods produced by this drier are thoroughly dessicated, and, instead of being damp and clammy, like the Alden goods, are dry and firm. Either of these processes unquestionably preserves the fruit, and at the same time retains most of the properties of fresh fruits and vegetables in a condition ready to be developed again by returning their quantum of water. Fruit-drying machines are destined to become as necessary, in a commercial point of view, as the flour mill, sugar refinery, or other well established manufacturing apparatus. Every farmer who has a surplus of fruit or vegetables above what is necessary for home use, will require some arrangement for preserving them, and thus render them available during the months when fresh fruit and vegetables cannot be obtained. California, with her superabundance of fruits of all kinds, will appreciate the great value of these machines, and will use them for the purpose of enabling her to send these otherwise perishable products to all portions of the world where a demand exists. The fruit-drying industry is now in its infancy. A few years hence, we believe, will show a different state of things. Large drying establishments will be in full operation. Large farmers will have their own driers, and the dried products will be found upon every table. Time alone will tell which of the machines offered to the public is the best.

An Interesting Mine Model.

One of the most interesting and unique novelties in the Pavilion, is the representation on glass, of the New Almaden quicksilver mine. It is not only an exquisite work of art, but it constitutes the most palpable, truthful and comprehensive work of representing the underground workings of a mine which has ever been devised. No description can do it justice; it must be seen to be appreciated. The whole mine—its topography, with the trees, buildings, etc., thereupon, and all the shafts, tunnel's, drifts and ore-bodies below the surface are distinctly shown in a model of about twenty-six inches square surface by ten inches deep, just as it would appear to a clairvoyant who might possess the power, while standing upon the lower portion of the surface of the mine, to look directly through the earth and rock, and view collectively the entire underground work.

The model stands upon a pivot and may be turned so as to view more closely from any given point any particular portion or section of the mine. The direction and inclination or depth of the various tunnels, shafts, etc., are most distinctly and accurately shown. The ore-bodies, as they existed before being worked out, are distinctly shown in red color (the color of cinnabar), by which they are readily distinguished from the misty or light slate color of the country rock, and the blackness in which the dead openings have been made in various directions to reach the ore.

It is well known to quicksilver miners, and indeed to all who are thoroughly read up on this speciality of mining, that cinnabar ore never occurs in regular veins or lodes, like silver or gold; but is found in detached bodies or deposits. This fact is made strikingly apparent by the merest glance at the model on exhibition. Yet by gradually turning the same or passing around and viewing it from different directions, it will be seen that the main bulk of the ore-bodies bears a most striking general conformity to the abrasion of the surface.

This fact may afford some important hints for prospecting elsewhere among the quicksilver deposits which are now being so largely sought for in various portions of the State. This model thus represents the most perfect means for a careful study of the mine, and shows in a most striking manner the greater amount of uncertainty met with in mining for quicksilver over the search for precious metals, which are almost always found in more or less continuous veins. We believe this is the first attempt of this mode of mine delineation and will, no doubt, be generally introduced at mining schools for purposes of instruction, as well as for record and aid in practical mining explorations—a copy therefrom should form one of the first requisites for our School of Mines at the State University, or should be supplemented by similar representatives of three or four of our principal gold and silver mines. Much credit is due to the artist, Mr. Charles T. Healey, C. E., by whose painstaking skill this beautiful exhibit has been prepared and placed on exhibition for the general benefit of the public.

In order to enable the reader, who has not or cannot examine it in person, we will say that the model consists of twenty-six plates of glass about 26 inches long by 11 inches in width, set edgeways in a frame and one inch apart. Each inch representing one hundred feet, whether in hight, depth or length. To prepare the model the surface ground of the mine is first surveyed off for the topography by running lines 100 feet apart north and south, east and west. Similar and corresponding surveys are next made throughout all the underground workings. There are twenty-six plates of glass upon each of which one of the surface lines is drawn; whatever points in the underground workings these lines would cut if they were projected so as to form a sectional plane to the lowest explored depths are then depicted upon the glass in their proper position. When each plate of glass, thus prepared is placed in its proper position in the frame, the observer is enabled to view from the outside where each of the lines would cross, and of course the excavation between the points of crossing can all be shown as upon an ordinary map as sectional drawings. The whole thus placed together, the glass being transparent, enables the observer to view, as with a clairvoyant's eye, every exposed portion of the mine through a cubical space of about 2,600 feet in depth, from the highest point, which is as low as excavations have been made.

An Interesting Feature.

Those who have witnessed the previous exhibitions in this city cannot fail to notice the marked superiority of this over any other of its predecessors, in the way of the prominence which is apparent in the matter of home over foreign industries and productions. This distinctive feature forms a most interesting and encouraging subject for quotation, and affords the most indubitable evidence of the rapid progress which our young State is making in those industrial pursuits without which our gold would be as dross, and our silver as worthless stones. This fact is most notably apparent wherever we move throughout the whole extent of this magnificent and varied display of industry.

No one or two visits can convey any adequate conception of the variety, extent, or interest of the exhibition. Every department may be made a study, and visited again and again. If the visitor will follow us carefully through our daily reports and notices of special interest, which cannot be completed in short of a month of our daily issues, he will find many a hint thrown out with regard to the various articles on exhibition, which alone but the practical skill and observation of a professional and special reporter would be likely to discover.

The present exhibition will form a most important era in our history as a State, and cannot fail to stimulate to still greater exertions in the great race of progress which we have so successfully inaugurated with the older communities of the Atlantic States and Europe. It would add much to the important results of the exhibition if the Institute would appoint a suitable commission to study and report upon the various exhibits according to their several classes, and in a proper form for official publication. A most valuable and instructive volume of from three to four hundred pages might be thus prepared for circulation both at home and abroad, which work, if properly done, would well repay the outlay, and add largely to the reputation of the Institute and the credit of the State. Such a work is all the more needed at this time, from the fact that in the absence of any award for premiums, and consequently of the usual "committee reports," no record will exist after the close of the exhibition, except the meager and fugitive reports which may be gathered up here and there from the various newspapers of the day.

A Good Feature at the Fair.

A gratifying feature of the present Fair is the large number of mechanics among the audience. While the Fair, owing to its many attractive qualities, is justly regarded as a desirable place to spend an evening in the enjoyment of good music and the exhilaration of a well-mannered crowd, it is yet not forgotten that it is essentially an *industrial* exhibition. Hence, it is pleasant to see our workingmen coming night after night, generally with their families, and taking an intelligent interest in all the mechanical contrivances, and otherwise increasing their knowledge. A large proportion of the artizans of the city are men whose intelligence is far above that which people coming from Europe and some of the best manufacturing centers of the East, would expect to find in this class. Here the man who is employed to-day may quite likely be the employer a year hence. The time will soon come when the surplus capital which is accumulating in this State will be engaged in manufacturing enterprises, and the man with hands and mind trained in some industrial specialty, will find himself in possession of a lucrative capital. Many of our mechanics make a point of attending the evening schools where mechanical drawing is taught, and where they may obtain theoretical knowledge of the principles of mechanics generally. These men are the ones who will rise, and these are they that are seen attentively studying the workings of new machines at the Pavilion. It is to be regretted that workingmen generally have not a stronger realization of the importance of what not a few hold in contempt—"book knowledge." It is the man who unites this with his practical skill who becomes the foreman and eventually the employer.

We hope to see an increase in the attendance of mechanics. To them more than any other class the Fair belongs, and it is chiefly the results of their labor which make the Pavilion the attractive place it now is for all classes.

JOHN A. BALL, the inventor of the dredging machine which was recently used in excavating the channel in San Antonio creek, at Oakland, proposes in his advertisement, on another page of this paper, to construct and furnish a complete dredging machine for the sum of $20,000, and guarantee the machine to remove six cubic yards per minute. This certainly appears to be a reasonable offer. In a subsequent issue we propose to say something more about this dredge.

TWENTY-FIVE white and 50 Chinese miners are hard at work in the Loon creek diggings, Idaho. The prospects are encouraging.

THE lately discovered quartz mines on Bully-choop mountain, Trinity county, are attracting considerable attention.

A Model Hydraulic Mine.

We were able thie week to get aome facts concerning the operations of the Spring Valley Mining and Canal company at Cherokea Flat, Butte county, California. We are rather glad to get some notes from the locality, as the company referred to is spoken of as one of the best managed and worked in the State. The outfit is complete, and if visitors to California want to see a representative hydraulic mine, they should visit the Spring Valley company's property. The claim comprises 1,500 acres of ground, containing pay gravel to an average depth of 300 feet. The company hae expended in tha works, flumes, ditches, reservoirs and water privilegee over $1,000,000.

They have on the line of their ditch about *four miles* of iron pipe, 30 inches in diameter. One section of this pipe conducts the water across the west branch of the Feather rivar. It is laid in tha form of an inverted siphon, and has a vertical depression of 856 feet. The accompanying diagram will give an idea of the position of the pipe, which is somewhat eimilar to the pipe used by the company, which furnishes water to Virginia City and Gold Hill. *A* is the ditch which leade the water to the pipe. *B* is a ditch on the opposite mountain which receives it. Thia pipe has a depression from the level of the discharging arm of 856 feet. The receiving arm has a head of 180 feet vertical pressure. The length of the inverted siphon is two and a half miles, and the pipe is 30 inches in diameter.

There are ten miles of sluices, varying from four to six feet in width, and 23 undercurrents from ten to 40 feet in width. For the year ending July, 1874, the sum of $476,112 in gold waa washed out and shipped. They employed 160 hands all the year round, and expended $125,000 during the same time, of which $85,534 was for labor. The quickailver alone used by the company for the year cost $13,309. For iron pipe they paid ont $8,839.

The water need is brought by two ditches, 60 miles in length, from Butte creek, and from the head waters of the west branch of the Feather river. The ditchee are six feet wide at bottom and eight feat wide on top. They are four feet deep and run a conatant stream of 2,200 inches of water.

This company is known aa a "close corporation;" that ia, the stock ie not dealt in at the stock boards, being held hy few persone. That the claim ia profitable may be judged from the fact that they paid out $150,000 in dividends during the year ending July. During the year they constructed a continuous line of sluices 3,560 feet in length and six feet in width. This gives them a triple line down Sawmill ravine. Three undercurrents were built and three abandoned. The mining claims purchased during the year cost $28 308. They used up over $11,000 worth of powder during the year. The aasets of this company in July amounted to $4,344,496 and the actual liabilities amounted to $143,869. The officers of the company are as follows: Egbert Judson, President; Mr. R. C. Pulliam, Superintendent; Louis Glass, Secretary; Trustees, E. Judson, Wm. Gregory, Isaac E. Davis, M. R C. Pulliam and Richard Abbey. The miue turned out last year the largest gold bar ever made, being valued at the mint at $71,273.15, and it has been said that they will send a bar worth double this amount to the Centennial Exhibition.

A rather peculiar feature in this claim ia the fact that diamonds are found in the washings; most of them, however, hy the primitive method of rocking. One diamond worth $250 was cut in Boston in 1864, and last year several were tested in Amsterdam and Paris and pronounced diamonds of the first water. Professor Silliman has examined these saods carefully and enumerates the mineralogy of the Cherokee washings as yielding gold, platinum, iridoemine, diamonds, zircon, topaz, quartz in several varieties, chromite, magnetite, limonite, rutile, pyritee, garnets, epidote and almadine. One of the diamonds found weighed 2¼ carats.

Stickeen Mines.—A letter, in another column, gives some interesting statements concerning the Stickeen river mines. We notice that the Indians up that way are becoming troublesome. We see by a dispatch from Victoria that the "Otter" brought down $90,000 (?) in gold dust from the mines. Only four beeves and 90 sheep now remain to supply 500 or 600 miners with fresh meat, at 65 cents per pound, and by the end of this month there will be no fresh meat, unless the overland trains arrive. These are owned by Messrs. Nelson & Bent. From Mr. Johnson, mail carrier, we learn that on Deese creek the McIntyre claim was paying about the best—30 to 40 ounces a day of 24 hours, to eight hands. The Brady claim was said to have yielded 300 ozs. in one week. The ground is very spotted, in places paying from $7 to $8 a day to the hand, with rockers. About one and a quarter miles of Thibert's creek pays pretty well, but the pay dirt is only 12 to 18 inches thick, and is soon worked out.

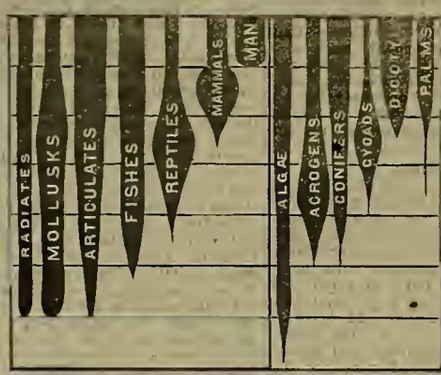
The American quicksilver mine, in Lake county, recently purchased by George S. Wright and others, last week made its first shipment of 45 flasks, the result of 15 day's run with six retorts.

The freight receipts over the Virginia and Truckee railroad, since the first of the present month, have been greater than ever before.

Progress of Life.

In our issue of August 8th, we gave an illustration showing the building up of the earth's crust, and the various periods into which it has been subdivided by scientists. To-day we illustrate the progress of life, as developed by an examination and study of the fossils contained in the various deposits and geological subdivisions of as much as is known of the earth's crust.

Referring to our illustration, it will be observed that the diagram is separated into two general divisions, the one for animals, the other for plants. It is again divided into seven subdivisions, corresponding to the geological "periods" already alluded to. Commencing with the lower or Azoic period, we find the first appearance of life was vegetable—the *Algæ* (sea-weeds), a flowerless order of plants, propagated by spores instead of seeds, and vegetating in low, swampy places, or such as are entirely covered by water. This is the lowest form of life, and just what we might expect to find at the very beginning thereof.



PROGRESS OF LIFE IN GEOLOGICAL AGES.

As soon as we leave the Azoic period we come into the lowest order of animal life, which consists of Radiates, Mollusks and Articulates (crustaceans and worms). Each of these have continued in slightly varying quantities through all geological periods to the present time. The width of the shadings represent their increase or decrease through the several periods.

Fishes next commenced their existence, and have slowly increased in numbers up to the present time.

Next follow Reptiles, and after them Mammals, with very important variations in quantities until we reach the age of man, the last and crowning act of creation.

In Regard to Plants,

As we have already said, we first find the *Algæ* or sea-weeds—flowerless plants; next come the Acrogens, a second class of flowerless plants, embracing the coal-plants, the wonderful abundance of which, during the carboniferous age, is strikingly manifest from our diagram. The Conifers also began to appear about this time, and, as will be seen, have steadily increased to the present time. In subsequent succession came the *Cycads*, the *Dicotyls*, and lastly the palms—the most magnificent of vegetable creations.

The remains of all these animals and vegetable creations are found as fossils, and always in the order of superposition as here given. This diagram presents a most interesting and instructive study.

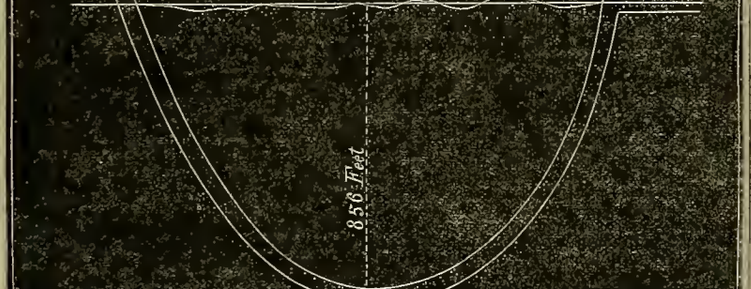
The hydraulic claim of Messrs. Veith & Shear, Calaveras county, has reported again. A recent clean-up, after a run of 20 days, paid $3,000. And the claim isn't fairly opened yet. It will pay $6,000 per month this winter.

The test of the Soapstone gold mine, at El Dorado county last week, was very unsatisfactory. The specimens received at this office were very handsome, and looked pretty rich.

The Marysville Foundries.

One of our travelling correspondents has lately visited the town of Marysville, and sends us the following notes concerning the foundries in that place;

The Empire Foundry and Machine Shop, Williamson & Cory, proprietors, during the past two years have made a specialty of the Little Giant hydraulic machine. The superiority of their work was apparent, and of course they obtained the preference, and they have received orders from all the mining districts in this State, and from Oregon and Mexico. A few days since they received an order from Ohio for one of their machines, which will not reach its final destination till it gets to Michigan. Mr. H. B. Williamson showed our correspondent over the works. Among the manufactured articles was a fine show of enormous nozzles, some of them of such dimensions as to be capable of discharging a stream of water equal to 50¼ square inches, the nozzles being 8 in. in diameter. These works cover an area of over 50,000 square feet. Besides their other departments they go largely into the manufacture of agricultural implements, and have skilled workmen who are prepared to make, repair and keep in order all kinds of ponderous machinery, and even the little, useful sewing machine. They put up a sawmill, run by a 45 horse power, which cut 22,700 superficial feet in the time between 12:40 P M and 6 P M. They have been constantly employed on mill work for the past year, and have orders which they have not yet filled. They run a gang of 60 hands.



INVERTED SIPHON ON SPRING VALLEY COMPANY'S PROPERTY.

They are putting a handsome cast-iron fence aronnd the Court house at Yuba city, Sutter county. They are also making the iron doors for the Grangers' warehouse, and the engine and machinery for the new steamer now being built by Orr Bros., of Yuba city. Their portable engines are much admired.

Another of the large and prosperous foundries of this State is that of the enterprising firm of Preacott, Eckert & Co., of Maryaville, Yuba county, whose card appears in another part of this issne. This foundry was established in 1854.

The buildings in which the various industries of this establishment are carried on are of brick. The works require an area of 30,000 feet, and give constant employment to more than 40 employees, who, judging from their cheery looks, must like their work, their wages and their "bossea." The specialty of this firm is mining machinery. A silver mill is now receiving the finishing touches, and will be shortly sent to its destination—Battle Mountain. Another, a gold mill, left their works last week for a firm at San Diego. Their work is found in every mining locality west of the Rocky mountains. The increasing demand for their work requires the enlargement of some of their machinery, and general increase of their facilities.

W. C. Howes has been appointed Superintendent of the Table Mountain Blue Gravel mine, Tuolumne county. They are now running for the back channel.

Our Sugar Interests.

One of the most important interests connected with the manufacturing industries of California is that represented by our sugar manufactories and sugar refineries. The amount of capital invested in this business is very large; while the products of the industry reach fully five millions of dollars annually. Of manufactories proper we have two—both engaged in the production of beet sugar: the one at Sacramento, and the other at Santa Cruz (formerly at Alvarado). We have also four refineries, all located in this city, which obtain their raw material (cane sugar) from China and the islands of the Pacific.

The only exhibit of this important industry is made by the Bay Refinery, located at the corner of Union and Battery streets. This company makes a very interesting exhibit—first, of the various raw sugars as they are imported; then of the various stages of refining, represented by the sugar in solution after its first, second and third processes of filtering; and finally of the refined sugar, as brown, white, loaf, crushed, granulated, etc. But the most interesting part of this exhibition consists of the small, regularly formed cubes, so remarkably uniform and crystalline in appearance. This sugar is made by what is known as the

Partz Cube Sugar Process.

This is especially a California invention, and one of the most important and valuable which has been introduced into sugar making for years. It consists in a process by which hard, white sugar is produced in a much less time and at less cost than has hitherto been done. Moreover, the sugar produced by this process is decidedly superior to any other, and commands a higher price in the market. This sugar is now made by the Bay Refinery only, which has the exclusive control of the process on this coast for cane sugar, where it has been in successful operation about one year. Its application to beet sugar being reserved by the proprietors of the patent, the process will soon be introduced at the Santa Cruz beet sugarte.

These little cubes that look so nice, so hard, and so regular, are turned out by an ingeniously constructed machine, whereby the soft, granulated sugar, as it comes warm from the centrifugal, is in a few hours transformed into cubes as shown. The process of making the sawed cubes, which are far less a perfect and uniform, requires as many days for its accomplishment as the Partz process does hours; while the preparation of loaf and crushed sugar requires almost as many weeks. Moreover, the introduction of this process into any refinery increases its capacity from one-third to one-half, without any further addition of floor room. These facts may enable the reader to form some idea of the value and importance of this California invention, the products of which are now for the first time placed on public exhibition.

It is to be regretted that it has not been found practicable to place one of these ingenious machines on exhibition in the Pavilion. Only one has yet been put in operation. Three more are in process of construction at the Ætna Iron Works in this city—one of which is for the Bay Refinery, another for the Santa Cruz beet sugarie, and the third is to be sent to a refinery in New York City.

Harvest Fires.—Reports still keep coming in of destructive harvest fires occurring during the harvest progress. A note from a subscriber informs us that on Aug. 17th a large portion of the wheat on the ranch of George Morres, of Potter valley, Mendocino county, was burned, together with Hughes' "Separator" threshing machine. The fire is supposed to have caught from a neighbor's threshing machine.

The water in Klamath river is lower than it has been for years at this season. This is good for the miners, as it will give them an opportunity to work to the bed and bars by means of wingdams.

The proposed Colfax and Nevada railroad will not be built unless the amount demanded by the Directors—$74,000—is forthcoming by the first of September.

The discovery of some rich gold-bearing rock in Cucomonga cañon is causing considerable excitement in Los Angeles. A number of claims have been recorded.

The Phœnix quicksilver mine, Napa county, is now producing between 70 and 80 flasks per month.

Rapid progress is being made at the hoisting works of the Dayton mine. The new boilers are in position and ready for use.

The quartz mines at Rocky bar, Idaho, are yielding a handsome return, and business is consequently prospering.

Work on the Columbia marble works, Tuolumne county, has been suspended, owing to some difficulty about contracts.

Moony & Kinder have sold their mine in Placer county to a Philadelphia company for $70,000.

A smelting furnace is being erected in the Newark district.

Hydraulic Mines of the San Juan Range.

A correspondent of the *Bulletin* writes as follows from North San Juan: As the hydraulic or deep gravel mines in this section of the country are now attracting the attention of speculators, and are largely owned by San Francisco capitalists, a few lines concerning their extent, value, present condition and manner of working may not be uninteresting to the readers of your paper. The mines, or what is known as the San Juan range, extend from French Corral to Snow Point, a distance of about 30 miles, and are located on an immense ancient channel, or river-bed, that traverses the ridge of land embraced between the south and middle forks of the main Yuba river, coming from the direction of the Sierra Nevada mountains, and terminating at French Corral, which is the western extremity of the ridge.

The Ancient River-Bed—The Blue Gravel.

This ancient channel is, in elevation, from four to six hundred feet higher than either of the rivers between which it lies, and its gravel deposit is, from 200 to 1,500 feet in width, and from 100 to 600 feet in depth; gold is disseminated throughout the entire deposit, but the gravel is always the richest near the bottom or bed-rock. The color of the gravel is, in the upper portion of the deposit, red and white, and near the bedrock is deep blue. The blue gravel is generally cemented, and requires blasting before it can be washed. The channel is not continuous, but has been cut in places by deep ravines and cañons, and broken by land-slides. The largest of these breaks occurs between San Juan and Badger Hill, where all trace of the channel is lost for a distance of about five miles.

Principal Mining Districts.

The most important mining districts along the line of the channel are French Corral, Empire Flat, Kate Hayes' Flat, Birchville, Buckeye Hill, Sweetland, Manzanita Hill, San Juan, Badger Hill, Cherokee, Chimney Hill, Columbia Hill, Kennebec Hill, Grizzly Hill, Lake City, Malakoff, Humbug, Relief Hill, Woolsey Flat, Moore's Flat, and Snow Point. All of these districts were established in "early days," and each has its own peculiar local laws, prescribing the manner of locating claims, and the amount of work necessary to be done in order to hold them after being located. In many districts, however, the records have been lost, or intentionally destroyed; consequently where conflicting interests arise, and the courts are appealed to, the party that can do the "tallest swearing" generally wins, and I have noticed that men can swear in mining suits with as little regard to a hereafter as in any other class of cases that come before our courts.

Leading Companies.

There are now three water companies on the ridge to supply the mines with water, *i. e.*, the Eureka Lake and Yuba company, consolidated; the North Bloomfield Gravel Mining company, the Milton Water and mining company.

Eureka Lake and Yuba Canal company consolidated, M. Z. Mirabach, of San Francisco, managing agent, is a New York corporation, the oldest of the companies named, and formerly enjoyed a monopoly of the water business of the entire ridge. The property of this company consists of a consolidation of the water rights and ditches of the Old Miners' ditch, Poor Man ditch, Lake ditch, Humbug ditches, Bloody run and Grizzly cañon ditches, and the San Juan or Yuba canal companies' ditches. The company have now in use three main ditches, with an aggregate capacity of about 3,900 inches per day which, in a favorable season, will run for about ten months in the year.

The North Bloomfield Gravel Mining company is a San Francisco corporation. S. F. Butterworth, L. L. Robinson, D. O. Mills and W. C. Ralston are the principal stockholders. They have one main ditch with a running capacity of 3,000 inches per day. The Milton Water and Mining company is another San Francisco corporation, in which Egbert Judson and A. Block, are largely interested. Quite a number of the business men and miners living in this vicinity are also shareholders; among the number are Simon Furth, V. G. Bell, Daniel Furth and H. C. Miller. This company recently purchased the water-rights and storage reservoirs on the middle Yuba river, formerly owned by the Sierra Nevada Lake Water & Mining company, of London, and are now engaged in constructing a ditch from the Milton dam, with a running capacity of 2,500 inches per day. The ditch will be completed by November next, and will be one of the most substantial works of the kind in the State. Each of these companies own large tracts of mineral land, and the North Bloomfield Gravel Mining company and the Milton Water and Mining company are both engaged in the construction of extensive works for the development of their several possessions.

Enhanced Value of Mining Property.

The improvements that have recently been made in hydraulic mining, and the reduced price of water, brought about by competition, have greatly enhanced the value of mining property here, and added new life to mining enterprise. Ground that has been lying idle for years, and that never could have been profitably worked, under the old system of hydraulicing, and the high price of water, is now valuable and being put in working condition. The fact, too, that a patent or permanent title to the mineral lands can now be obtained from the government has added greatly to the value of mining property, for it removes at once the principal objection that capitalists have had to to taking mining risks; and now, when titles are perfected in that way, money for the development of mines is easily obtained at fair rates of interest. Though hydraulic mining has been carried on here for nearly twenty years, until recently but little has been done toward the development of the great gravel deposit, all of the work having been done at points readily accessible, and where the gravel could be reached with short tunnels; and though during that time a large amount of gravel has been washed away, but a very small portion of the channel has been disturbed; and, notwithstanding that there are districts where the mines cannot be profitably worked, in consequence of the great depth of pipe-clay and mountain dirt, overlying the pay gravel, and others situated so far back from outlets that there is not sufficient fall for the construction of a drain-tunnel, through which to work the bottom gravel, yet the next fifty years' washing will not exhaust the auriferous gravel that can be mined with profit, and it is more than probable that long before the expiration of that time there will be improvements made and changes take place that will so far lessen the expense of working as to make valuable mining ground that is now looked upon as being entirely worthless. The value of a hydraulic mine depends in a great measure upon the advantages there are for working it.

Causes of Failure.

The great aim of mining speculators seems to be to get hold of a large tract of ground that will make a good showing on paper, and from which rich prospects can be obtained with a pan. Whether in reality it can be profitably worked, is a minor consideration with them; for so long as they can put it on paper, and work it in such a manner as to get capitalists and outside parties interested, and make it profitable to themselves, it is all they desire. This, together with the appointment of incompetent persons to superintend mines, is the principal cause of the many failures that have been made in large mining enterprises in this State. Mining is a business that it takes years of experience to learn; and no man, whatsoever his qualifications, is competent to manage and superintend the working of a hydraulic mine, unless he has served an apprenticeship, and in that way gained a thorough knowledge of the business. Where this rule is not followed, failure will be the result in nine cases out of ten.

Mining Enterprise.

For a number of years J. H. Bradley has owned a valuable piece of mining and ditch property at Henry's diggings, near Grizzly Flat, this county. The mine is a gravel claim, embracing about 240 acres, with a rich pay streak averaging about four feet in thickness next the bed-rock. The deposit in the center of the hill is estimated at about 150 feet in depth. There is a fine outlet and practically unlimited advantages for dumpage of tailings. The water right will afford a supply of fully 1,000 inches of free water for six months in the year. Bradley had invested his all in securing the mine and the ditch property. He estimates the cost of constructing a new flume and opening the mine in good shape for hydraulic operations, at $6,000. For years he has been striving to induce parties with that amount of capital to take hold of the enterprise, leaving him a fair amount of unassessable stock. We are delighted to learn that he has at last succeeded. A number of San Franciscans, with ample capital and of resolute will, have become associated with Bradley and have incorporated under the name of the "Carrie Hill" Mining Co. Bradley is to superintend the immediate construction of the new flume, for which 80,000 feet of lumber has been ordered, and a large invoice of spikes and nails have gone forward. As a matter of necessity, from the impossibility of obtaining white labor, a gang of Chinamen is being organized. Our energetic and long-suffering old friend is also to superintend the opening and working of the mine, for which purpose we are quite sure that no more capable man could possibly be found. And we have no hesitation nor fear in venturing the prediction that if the mine is opened according to his ideas and plans he and his associates will reap an abundant reward. We have a strong conviction that the Carrie Hill is destined to prove a magnificent mining property—a very fortunate investment for those engaged in it; and it affords us unaffected, unalloyed pleasure to anticipate the well earned success which is to reward Bradley's indomitable perseverance. We always like to see one of these half-dog, hang-on miners win an ultimate triumph over a seemingly unconquerable concatenation of adverse circumstances and surroundings. There is a sublimity in their frequent exhibitions of faith and patience which we admire more than we can express.—*Mountain Democrat.*

BLUE PIGMENT OF THE EGYPTIANS.—Fifteen centuries before the Christian era, the Egyptians appear to have been acquainted with the preparation of three distinct kinds of blue pigment, prepared from mixtures of sand, soda and lime, with oxide of copper. One of these fine colors has been lately examined by M. Fontenay, and by analyzing he has been able to reproduce them in all their qualities of brilliancy, permanency, etc.

THE "dry inkstand," which needs only to be supplied with pure water, is now found to be an old device.

Mining at Dutch Flat.

The Nevada *Transcript* says: The mining district of Dutch Flat and Gold Run, for the two towns are so close together, and their mining interests are so closely blended, that it has long been noted for its yield of the precious metal, and for the certainty with which the hardy miner could count on a return for his labor. The hydraulic process was first begun in the spring of 1865; the Bear river ditch supplying about 650 inches of water, having been brought in. The yield that year was light; but in the succeeding years of 1866 and '67, work was prosecuted more extensively, and about $600,000 was taken out each year. In 1868 a party of miners owning these claims bought the Bear river ditch, and organized the Gold Run Ditch and Mining Company, and it is now the largest operator in that place. The capital stock is $905,000, and it is all owned by citizens of Gold Run and Dutch Flat. The stockholders are J. H. Kinder, Wm. Judd, J. F. Moody, J. L. Gould, Allen Towle, Frank Sachs, S. D. Moore, H. H. Brown and Victoria Walcott. Allen Towle is President, H. H. Brown is Secretary and Treasurer, and J. L. Gould is General Superintendent. They have over $200,000 invested in mining property, of which $80,000 is in ditches. Their water comes from Bear and South Yuba rivers through twenty-eight miles of ditches. This season they have had plenty of water and expect to run seven or eight months. They are working five claims, and 2,000 inches of water, and employ 40 men. They own the following claims: Indiana Hill, North Star, two-fifths of the Druid, one-half of the Gold Run, Church and Golden Gate, Kearsarge, Bay State No. 2, Pinetop. Thus far the surface gravel to the depth of 100 to 175 feet only has been worked, the lower stratum of over 200 feet in thickness not being workable, for want of fall to carry off the tailings. The company are now engaged in the prosecution of an enterprise that cannot fail to have a very beneficial influence on the mining interests of this section.

To procure the necessary fall, and enable them to work these rich beds, the Gold Run company are running a tunnel over 3,000 feet in length through the mountain at a depth of 600 feet below the crest of the ridge. The lower end of this tunnel opens into Cañon creek, while the head will open directly under the great deposits of blue gravel and furnishing means of working them to the bed-rock. Hoskins & Bro. are working a claim of 70 acres. They employ 15 men and use 600 inches of water. The Fishhawk company have a claim of 40 acres, use 550 inches of water and employ six men. O. Harkness uses 500 inches of water, employs seven men and works on a claim of 40 acres. The Indiana Hill Blue Gravel company is drifting on the channel, and crushing the gravel in an eight-stamp mill, driven by water-power. It is working 30 hands and is doing well. J. F. Moody works the tailings of all these claims, and is making a better thing of it than any of the claims. He owns about 3,000 feet of the cañon, in which he has fitted flumes and undercurrents, and now has nothing to do but catch the gold that escapes the workmen above. His clean-ups have been of the most satisfactory character, and this season's work will probably net him a larger amount than usual. In fact, all the claims have paid well, and an expression of satisfaction rests on the countenances of all the miners.

The Cedar Creek Gold Mines and Water Co. is the principal concern doing business at Dutch Flat. It is an English corporation, having a capital of £200,000. The principal office is in London, where the President, George Batters, and the Secretary, W. J. Livingston, reside. Its business headquarters are at Dutch Flat, and the management of its extensive works are intrusted to T. B. Ludlum. This company is prosecuting its work with vigor, and employs a large force of hands. The old Placer county canal, after passing into its hands, has been improved and extended until the company now owns about 60 miles of ditches. The capacity of the main ditch is 6,000 inches of water, the greater portion of which is used by the company in operating its claims. Of these the principal are the Pacific, the Central, Jehoshaphat, half of the Gold Run, the Home Ticket, the Gem. Altogether, it owns 32 claims, comprising some 200 acres of mining ground, employs 150 men, and uses 3,800 inches of water, besides 1,450 inches twenty-four hour water to outside parties. It is also engaged in running a bedrock tunnel for the purpose of tapping the Dutch Flat channel, work on which has been progressing for some time with favorable results. The tunnel when completed will be 3,000 ft. in length and 8 ft. by 8 in size. It is now in 660 ft. and has reached the first shaft, from which washing began about the first of this month. In prospecting this important work eighteen men are employed. Three Burleigh drills are used, the air being compressed by water-power. The drill and machinery in use by the Cedar creek company cost $12,000, and while the work of driving a tunnel is not materially cheapened by their use, the saving of time outweighs every other consideration. A blast of 300 kegs of powder is now about ready to be fired in the Yankee Jim claim, which is being prepared for working. It is expected to open up a large bed of gravel for working. Besides the Cedar creek company, the South Yuba canal company is supplying water to the miners, its canal having a capacity of 3,000 inches. The water is taken from the south Yuba river, and is carried through about twenty-five miles of ditches. The following claims are being worked: North Star No. 2, owned by Lakemp & Voight. They employ ten men and use 500 inches of water. Their claim is paying well. The Red Bank company have sixty acres of gravel left, on which it is working five men and using 450 inches of water. The Summit claim runs seven men and 500 inches of water. The Somerset claim, owned by Staples & Bros., works eight men and uses 450 inches of water. Kidder employs five men and uses 350 inches of water. The general report is that more men are employed than ever before, and that the mines are paying well, and the prospects for the future are exceptionally brilliant.—*Argus.*

The Calistoga Quicksilver Mines.

In our last week's issue we gave a description of the quicksilver mines in our vicinity, commencing with the Kentuck and following the southwest arm of the belt, and ending at the Yellow Jacket. We shall in this issue commence at Pine Flat and follow the easterly arm of the belt. The first mine attracting our attention is the Georgia, owned by Thompson Brothers, of Pine Flat, and associates. Considerable developments have been made, and a large body of ore brought to view. The metal is exceedingly rich, and closely resembles that taken from the New Almaden. A tunnel has been run into the ledge, and the quantity of metal in eight would well warrant the erection of reduction works. The next mine, or rather mines, of value, are those known as the Bacon mines—a consolidation of locations which were bought recently by an English company, represented by Mr. Bacon, who visited England some eight months since, for the purpose of organizing the company and pushing the mine. A large body of men have been constantly at work on these mines since their purchase, and a fine body of metal has been developed. Mr. Bacon returned to England last week, taking with him quite a quantity of the ore. His visit is for the purpose of making arrangements for the erection of works for the reduction of the ore.

The next mine that attracts our attention is the American. This mine was formerly owned and worked by Mr. Perschbacker, and occupied a prominent position for a long time; but the unfortunate erection of furnaces, which failed to work satisfactorily, caused a cessation of operations at the mine, which passed into the hands of Cross & Co., of San Francisco, and after being held by them for some time, was recently sold to Mr. Wright, the present owner, who is expending a large amount of money on the mine. He has erected a large amount of retorts, and is using a stamp mill for the purpose of reducing the ore to a proper size to work in these retorts. The developments made at this mine, under Mr. Wright's direction, are very flattering, and the present indications at the mine warrant the assertion that the American bids fair to be a successful rival to its neighbor, the Great Western.

Lying between the American and Great Western we find the Pilot Knob, recently owned by our fellow-townsman, J. W. Norton, and associates. This mine has every appearance of being a direct continuation of the Great Western ledge. Several samples of rich ore have been sent to San Francisco. We next visit the El Madre. The stock in this mine is mostly held in San Francisco, and is readily changing hands at a fair price. The reputation of the mine is excellent. We next visit the Alice Cross, owned by B. S. Prickett and Charles Ridgley, of Knight's Landing, and Stuart and Elder, of San Francisco. A very long tunnel is being run under contract, to tap the ledge at a great depth. The croppings at this mine are very prominent, and it has been pronounced by experienced parties to be as good a prospect as any in the district.

We will now give a short description of the Redington mine, which lies some twenty miles northeasterly from the Great Western: This mine is producing more quicksilver than any mine in the United States, the yield last month aggregating nearly $100,000. The superintendent is Charles Livermore, who is at present working about 250 men. The owners are about erecting two more large furnaces of the Knox & Osborne pattern, having enough ore in sight to run the four furnaces uninterruptedly for a long time. There are 1,260 shares in the mine, and a dividend was declared last month of $20 a share. The stock is mostly owned by Mr. Livermore, of San Francisco, and Mr. Redington of the same place, and Goodman & Co., bankers, of Napa. We find also near Knoxville the Manhattan mine, owned by Messrs. King & Osborne. They have a furnace of their own patent, and are producing about 60 flasks a month, and have prospects of doubling the same before long.—*Calistoga Press.*

THE DEEPEST WELL IN THE WORLD.—At about 20 miles from Berlin is situated the village of Sperenberg, noted for the deepest well that has ever been sunk. Owing to the presence of gypsum in the locality, which is at a moderate distance from the capital, it occurred to the government authorities of the mines to obtain a supply of rock salt. With this end in view the sinking of a shaft or well 16 feet in diameter was commenced some five years ago, and at a depth of 280 feet the salt was reached. The boring was continued to the further depth of 960 feet, the diameter of the bore being reduced to about 13 inches. The operations were subsequently prosecuted by the aid of steam until a depth of 4,194 feet was attained. At this point the boring was discontinued, the borer being still in the salt deposits, which thus exhibit the enormous thickness of 2,907 feet.

Prospectus Compilation.

We have had occasion to review, in some of our recent numbers, the history of various companies, originally brought out under what were apparently promising circumstances, but which have ended in financial disappointment, and the ruin of many members of that confiding body, the British shareholder. But while we hardly feel inclined to bestow much sympathy upon that section of the British shareholder which allows itself to be tickled out of its money by seductive and high-promising prospectuses, we cannot too strongly condemn those who work behind the scenes, and are the means of leading so many into unfortunate speculations.

The art of prospectus compilation has attained, at the present day, a high state of development, and it appears to be guided by certain well-defined rules and regulations. It does not much matter whether the company, for which it is issued, is one undertaking public works, such as railways, docks, canals, etc., or for the purpose of carrying out industrial enterprises on the joint-stock principle, or even for the purchase and development of some patent invention, which promises to revolutionize all our preconceived notions; the general scope of the prospectus is ever the same, and the idea inculcated is that promoters and inventors are the most disinterested people in the world, and that it is a foolish thing for the over-cautious British shareholder to retain his money in investments, bringing in a miserable four or five per cent. interest, when he can so readily and safely obtain many times that amount, by simply signing his name to the "form of application" accompanying the prospectus, the demand for which is considerable judging from the large supply which comes to fill our waste-paper baskets.

Notwithstanding the diversity of objects treated by the prospectuses, there is a marked resemblance between them, both in style and mode of treatment. They have all a pleasing appearance, are printed upon the best of paper, and color is judiciously used, so that the special points may stand out prominently in variegated type to attract immediate attention; where diagrams or illustrative plans can be introduced they add much to the general effect. On the first page is placed in goodly array the names of the gentlemen forming the direction, those with handles being specially selected, and great care is taken in duly advertising the titles of the various other companies which have the honor of having them upon their boards. Next follows the body or descriptive part of the prospectus, and if written, as it should be, by a person of sanguine temperament having a lively imagination, and with sufficient tact to keep within the exact limits of truth, we have set before us, in a tempting and fascinating manner, all circumstances relevent and irrelevant, which may tend to persuade the British shareholders of the magnificence of the investment offered. It is necessary, of course, that such a person should have had considerable experience in this special art, so that whilst allowing full scope to his imagination he will always keep in mind the necessity of avoiding making positively inaccurate statements, as they have before this been the cause of much subsequent grief to the directors. Anything of a doubtful character is generally made to appear in the special letters or reports which accompany the prospectus.

The prospectus having been duly prepared and launched, it remains to be seen whether the public nibble at the bait. We presume there is always a certain safe average number of bites to a given circulation, to pay the printing expenses, otherwise the system of prospectuses would not be kept up.

Now what can we say to that very innocent section of the British shareholder who will so readily part with its money, to appear hereafter upon the scene in deep lamentation, because it has found out in the meanwhile that it is not all gold that glitters? We remark that in many cases the investors alone are to blame, for not having taken the precautions which would have saved this future trouble. For instance, it generally happens that when a prospectus is issued, there are already many companies in existence of a similar character, and that reliable information is to be obtained of their capital, earnings, etc; so that little else is required to be done, beyond instituting a comparison between them, to test the probable value or otherwise of the proposed scheme. Of course, all the poetry of the prospectus is to be discarded, and only such allowances are to be made for special circumstances as common sense will dictate. In manufacturing enterprises this is not quite so easy, as there may be contingencies affecting in a different manner undertakings of a like nature, and in the same district, but with railway companies, especially those for constructing works in foreign countries, the matter offers no difficulty, and the probable result can almost be reduced to positive figures.—*Engineering.*

A New Idea. — Mr. Wm. Pesohey says: In both wrought and cast iron a skin is formed upon the surface in the process of manufacture into the shape required. In wrought iron this skin will come off sooner or later in scales, even if the iron is painted. In cast iron it is thrown off in a granular rust. This skin is of no material value, and would be better removed as soon as manufactured, if it were not for the cost of doing so; when it is removed, and the iron painted with an oxide of iron paint, there will be no recurrence of scaling.

Pine Flat Mines.

A correspondent writes from Pine Flat to the Sonoma *Democrat*, under date of August 20th: Unusual activity prevails in this mining camp, partly owing to the fine showing that has lately been made in some of the mines, but mainly owing to the decision in the Caslamayomi grant case, which has encouraged many of the miners to go to work in earnest to develop their claims. At the Flag Staff they have made a very rich strike in the tunnel, which has tapped the ledge at a depth of two hundred feet. The length of the tunnel from the mouth to where they struck the metal is about two hundred and eighty feet. The owners are in high spirits, as the new strike makes it a very valuable mine. At the Sonoma they are turning out about forty or fifty flasks per month. The Rattlesnake is looking splendidly. They struck metal in their lower tunnel last week. They are putting up a twenty ton furnace, and have over three hundred thousand adobes made of an average weight of ten pounds, and have a large force of men engaged still making them at the rate of eight or ten thousand per day. At the Missouri they also made a rich strike last week. Pap Hopkins, the original "Hermit of the Geyser Peak," has been engaged there, and he developed a very fine body of ore in the bottom of the gulch, east of the retorts. They are also taking out splendid metal in the old workings above. The two retorts are turning out six to eight flasks regularly every week. The Missouri looks better than ever.

At the Lost Ledge they have opened out a very fine ledge of ore, and are turning out a large amount of quicksilver. The Kentuck is opening out splendidly—and, by the way, what an imposition is being worked upon the lessees of these mines. A toll house has been established half way between the Missouri and Kentuck, and they charge the Missouri and Kentuck folks one dollar for a six horse team going from the Missouri to the Kentuck. This is at the rate of fifty cents per mile. They also charge toll to the Missouri folks at the same rate for hauling from Little Sulphur up the hill to the mine, and the Missouri folks put the road in repair last spring, at a large expense to themselves. How long are these vampires to be permitted by our Board of Supervisors to charge such enormous tolls? Our mine owners ont in that vicinity have sufficient obstacles to overcome from foreign interference, and it seems that our own citizens, whose interest it should be to lend every assistance in their power toward the development of these important mining interests, should do so. Some of them, at least, are disposed to claim the pound of flesh, and more too.

At the Geyser mine a move is being made looking toward commencing active operations, and there is a well authenticated rumor that a furnace is to be erected.

Ascent of Mount Shasta—Remarkable Feat.—A party of tourists who lately ascended Mount Shasta performed a feat which has not often, if, indeed, ever been before accomplished. They made the trip from the camping-ground to the highest summit of the mountain, came back to the camping-ground, and went from thence down to Sisson's house, all in one day. The amount of climbing and fatigue involved in such a trip can only be appreciated by those who have ascended Shasta. The most remarkable feature of the matter was that four of the party were ladies, viz: Mrs. Churchill, of Yreka, Mrs. Cushing of Oakland, Miss Ellen Newhold, of this city, and Mrs. Sisson, wife of J. H. Sisson, the Shasta guide, and keeper of the house on the stage-road at the foot of the mountain. An unusually large number of tourists have made the trip to and ascended Mount Shasta this year. The view from the mountain is unsurpassed, and the region around it is one of the most thickly wooded, attractive, and beautiful in California. It is full of game and the rivers (the Upper Sacramento, the Pit and McClond) are full of fish.

A Good Education.—The late Edward Everett condensed into a single brief paragraph his estimation of what constituted a good education. Here it is: "To read the English language well, to write with dispatch a neat, legible hand, and be master of the first four rules of arithmetic, so as to dispose of at once, with accuracy, every question of figures which comes up in practice—I call this a good education. And if you add the ability to write pure, grammatical English, I regard it as an excellent education. These are the tools. You can do much with them, but you are hopelese without them. They are the foundation; and unless you begin with these, not with flashy attainments, a little geology, and all other ologies and osophies, are ostentatious rubbish."

A correspondent writes to the *Scientific American* and gives the following directions with reference to the proportions to be observed in constructing buildings for acoustic purposes: Let the whole structure be held in entire subserviency to the auditorium, regardless of needless ornamentation, and let the clear inside lines thereof be as follows: Make or take the whole length as one sum in feet, make the whole width one-half that sum, and the whole hight, to the center of the ceiling, one-half of the latter sum.

Street Cleansing in New York.—In ten years the annual expenditure for cleaning the streets of New York has increased from $13,500 to $1,000,000.

The survey of a narrow-gauge railroad route from Nevada city to Colfax has been completed, and the report of the engineer submitted. He makes the distance between the two points 22 and three-tenths miles. The cost of construction is estimated at $411,132.56. A resolution has been passed by the Board of Directors not to commence the work until $300,000 of the capital stock has been taken, and in the event that it is not all taken within a few weeks, the charter be thrown up. Only $70,000 remains to be taken to complete this amount.—*El Dorado Republican.*

In the two French colonies of Martinique and Guiana, there are more than 6,000 acres under cultnre with annato, the annual produce being 3,000,000 pounds. The production of annato now exceeds the demand, as no fresh uses have been found for this coloring substance.

The custom-house returns show that the quantity of opium imported into the country, now nearly 250,000 lbs annually, is ten times more than it was thirty years ago; and it is the opinion of physicians and druggists that not more than one third of the quantity is used for medical purposes.

In 1873, about 8,000 American mowers and reapers were sold in Europe; and it is estimated that, during the present year, no less than 12,000 mowers will be sold abroad, representing a value of $1,000,000 paid to American manufacturers of this class of machinery.

A national exhibition of textile plants, and machines employed in their manufacture, will be held in St. Petersburg this fall. The Russian Government seems disposed to give special encouragement to the cultivation of fibrous plants and the manufacture of textila fabrics.

A neat thing in hair-cutting in vogue among the Nagas, a tribe in British India, is described as follows: The operator inserts beneath the luxuriant locks of his customer a hatchet or knife, whereon he pounds with a wooden mallet until the edge shines through.

A recent writer on food says that a gent'e man of his acquaintance has for the last fifty years eaten daily two eggs at breakfast, making 730 per annum, or a total for the whole period of 36,500 eggs.

The stone quarry on Point San Pedro, leased by Mr. Jordan, is being worked by a force of 12 men.

Fires all over the country.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. For warded by mail for 50c. extra, at the Mining and Scientific Press Office, by

DEWEY & CO.

Ninth Industrial Exhibition

HELD UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE,

IS NOW OPEN TO THE PUBLIC,

Corner of Eighth and Mission Streets.

The Musical Exercises is noder the immediate direction of Professor GEO. T. EVANS.

The Art Department is under the arrangement of the S. F. Art Association.

The Horticultural Department is under the charge of the Bay District Horticultural Society, and will be one of the pleasing features of the exhibition.

PRICES OF ADMISSION:

Season tickets, admitting gentleman and one lady.$5 00
Season tickets, admitting one person..... 3 00
Season tickets, admitting juveniles under 14 years 1 50
☞ The above tickets are not transferable.
Single admission..... 50 cents.
Children under 14 years..... 25 "

Tickets can be obtained from any of the Managers, at the Mechanics' Institute, 27 Post street, and at the principal music and drug stores.

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

Ayer's Hair Vigor, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stabilished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the Vigor is praised for its grateful and agreeable perfume, and valued for the soft luster and richness of tone it imparts.

—THE—

MECHANICS' FAIR

DAILY.

Having been awarded the publication of the Daily Newspaper in the Pavilion during the Fair of the Mechanics' Institute of the City of San Francisco, commencing August 18th, 1874, we would respectfully announce that no efforts will be spared to issue a

LIVE AND DESIRABLE SHEET.

Its immense circle of readers will include all adult visitors at the Fair, embracing during the exhibition a large proportion of the most intelligent, energetic and influential citizens throughout the Coast.

Advertisers will secure the best terms and space by handing in their orders early.

DEWEY & CO., Publishers.

Certificate of Partnership.

We certify that we constitute a partnership, transacting the business of Printing in this State; its principal place of business is San Francisco, California; its name is SPAULDING & BARTO. The full names and respective places of residence of all its members are signed hereto.

Dated San Francisco, Aug. 5th, 1874.

GEORGE SPAULDING,
HARRISON BARTO.

Indorsed. Filed Aug. 5th, 1874.

WM. HARNEY, County Clerk.
By W. Stevenson, D. C.

6v29-4t

The Motive Power at the Pavilion.

The engines now driving the machinery of the Fair are from the Union Iron Works, Messrs. H. J. Booth & Co., and evince a very important advance step in the production of a steam engine combining simplicity of construction, economic results, beauty of design, few number of pieces, and access ability of all parts. These engines appeal to the judgment of every one as being the machines needed for this coast. The cylinders are 12 "bore 24" stroke, having the steam chest and foundation cast in one piece; the steam ports are very short, being nearly at right angles to the face of valve. The valve has a large lap and quick stroke. The bed embodies the well tested and correct principle of central bracing, first introduced by Corliss, and in this case most admirably carried out. The pillow block has the most improved method of adjusting the quarter-brasses, which insures a complete support on the entire surface of the brass, while being adjustable in every direction. The foundation is cast to the pillow block, making a most complete and simple equivalent for the old, expensive and cumbersome bed. The crank, top of pillow block, steam chest, throttle valve, fly-wheel and governor, are all splendidly finished, and in harmony with the general design. The valve stem and eccentric rod connection are carried in a simple and mechanically designed guide, accessible and substantial. The cross-head has large gib surfaces, adjusted by set screws and within reach and in sight at all times. The cross-head pin is of steel, with an automatic oiler attached. The lower slide is supplied with oil from a stationary oiler under full control of the engineer, while the engine is in motion.

In fact, every part of the engine seems to have been designed with especial reference to the convenience of lubrication, adjustment and rep ir. The oilers used are the Dreyfus Glass oilers on the wearing, and the Seibert Eureka oiler on the cylinder. One engine is fitted with Watson's steam packing for the piston rod, and one with the old-style hemp packing. The governors are of the Lamott patent and Hendy's manufacture, embracing the automatic stop in case of breakage of belt or gear, and have separate adjustment for nice regulation of speed; they are well built and nickel plated. The cylinders are cased with black walnut held in place with silver plated screws. All the nuts are supplied with finished washers, something not usually done, though it adds much to the general appearance.

The engines are intended to be used for the Palace Hotel, now building, and we congratulate the owners on the wisdom of their selection. If the balance of the appurtenances of that hotel are made in keeping with the engine, the public can have no fault to find.

Miners and Mechanics.

Do mining men often think how much they are indebted to the artisans and mechanics? Without their assistance mines could never be worked to the depth they now are, and ore production would be necessarily limited for want of proper hoisting machinery and crushing apparatus. At the same time the artisans are very slightly affected by the success or failure of individual mines. Wild speculation, haste to be rich, incompetent and extravagant superintendence, fictitious companies, etc., have depressed the mining interests of our State from time to time; yet the inventive, practical mechanic and miner have been at work continually, experimenting and perfecting improved applications of motive power, new processes, new pumps, and all the different appliances needful about a mine. The foundrymen of this city have greatly aided the mining interests of the coast in their successful efforts to manufacture improved mining machinery, though the miners scarcely give them the proper credit for the manner in which they have simplified and strengthened mining appliances.

The chinch bugs are making serious inroads on the corn crop of Brown, Pike, and adjoining counties in Illinois, and there is no calculating the extent of damage that will be sustained to this cereal; as the insects are seemingly just beginning to make their appearance. It may be safely estimated, say a good many farmers, that at least one-half of the corn crop will be destroyed.

Chas. D. Gibbes, of this city, has been appointed United States Deputy Mineral Surveyor, by James T. Stratton, U. S. Surveyor-General for California. Mr. Gibbes is an old Californian, perfectly familiar with every part of the State, and well known as a most efficient and reliable surveyor. The appointment is an excellent one.

Negotiations are on foot for the sale of the Perrin mine, several miles below Grass Valley, on Wolf creek, and the O'Connor mine, belonging to an English company, situated near Union hill, Nevada county.

There is a large deposit of cobalt near the head of the Walker river, and it is being extensively worked. The ledge has been traced for a long distance, and ore is being taken out in five or six places.

Our Press in the Pavilion.

We venture the assertion that there are few more interesting pieces of machinery than the modern cylinder press. Look at ours at work. How rapidly and neatly it turns out our immense paper, and yet how quietly it performs its duty. We would say here that it is the peculiarity of the Potter Press to work without noise, jar or friction. The little "Nonpareil" jobber is an excellent mate for it in this respect. Both machines are built for strength and move smoothly and easily along in their duties, without the characteristic clatter and bang of other presses. Where there are crashing and slamming there are friction and wear, just as surely as smoke is an indication of fire. Reader, whether you are a printer or not, examine these representatives of modern excellence in printing presses. *One thousand* Potter Cylinders are in use in toe best offices of the Eastern States, without a known enemy. Some of the finest illustrated works of the land are printed on the Potter presses, and for the excellent and at the same time rapid execution of the general requirements of the job printer, the two-roller extra heavy machine is the favorite far and wide.

An experienced and conscientious printer says: "It is my conviction, after a careful investigation, and comparison with other cylinders that the Potter is the *best*, as I find all the best points of the prominent machines retained, its renowned bunter spring and lever alone places it far ahead of all others, in giving the bed that beautiful, easy movement at a high rate of speed with no tendency to jar, nor to work the 'quads' up in the form. The rollers can be put in or out in half a minute, and the distribution is very superior. The whole machine is solid, firm and strong, and the workmanship and finish unexcelled."

The large factory, at Norwich, Conn., is now employing about 90 hands and turning out ten machines a month. To bring these cylinders up to their present standard of excellence and perfection has taken many years, and a vast outlay of money. We are glad that these presses are to be introduced on this coast; and knowing that the agent, Mr. N. C. Hawks, Manager of the Pacific Type Foundry, is a practical printer of seventeen years experience, we have faith that he will *succeed* in proving their merits to all who are interested, and who will call at 532 Clay street. It certainly gives us an honest pleasure in adding our endorsement of the good qualities of the Potter press, and we will say in this connection of the new type foundry also, which we notice is rapidly approaching considerable magnitude and enjoying a good trade already.

The new hoisting works of the Sierra Nevada mine smooeded in two days, with a single tank, in clearing the shaft of 225 feet of water.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Aug. 25th, 1874

For Week Ending Aug. 11th, 1874.

Suspension Buckle. — Christopher J. Weldon, San José, Cal.

Trap for Sinks and Basins. — Chas. W. Garland, San Francisco, Cal.

Bracket for Dentists' Chairs.—Geo. W. Gray, Albany, Oregon.

Grain Separator.—John T. Hicklin, Olympia, W. T.

Door Spring. — John Steed and Charles Nash, San Francisco, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

A COMPLIMENT.

Plainsburg, Merced Co., Cal., June 22, 1874.

Dewey & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. Rucker, M. D.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final cast-ing of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. McCarty—General Agent.

W. H. Rattenberry—California.

Chas. W. Otis—Contra Costa County.

Chas. T. Bell—Alameda, Santa Clara and Santa Cruz Counties.

J. W. Anderson—Orange and Santa Ana, in Los Angeles County, Cal.

Hoon Alston—San Luis Obispo, San Bernardino and San Diego Counties.

Jas. Kearney—Amador, Calaveras, Tuolumne and Mariposa Counties.

B. Goodwin—Sacramento County.

S. G. Crawford—Nevada, Sierra and Plumas Counties.

J. G. Kelley—For Washington Territory.

Campo, San Diego Co., Cal., July 3d, 1874.

Messrs. Dewey & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. Gass.

Fourth Year of the Pacific Rural Press.

The publishers of this journal design making its weekly issues during its fourth year (1874) still more acceptable and valuable than those of the past.

A Farmer's Paper Always.

The RURAL PRESS—established Jan. 1870, has been thoroughly a farmer's paper—"first, last, and always." Its success in popularity and rapidly increasing circulation has exceeded that of any other weekly on the coast.

Neither Politics or Creeds.

We refer with satisfaction to the independent, chaste and useful character of our reading matter and the absence from our columns of questionable and demoralizing advertisements.

We shall strive to make it an ever welcome visitor to those who desire to constantly

Improve the Heart and Mind,

And shall give a larger space to our HOME CIRCLE department, which from the first has been a popular feature of the RURAL.

Our aim is to gather information from all reliable sources, in the varied forms in which it is to be obtained. Our work is to divest our gleanings of all superfluities; condense such information as is of most importance to our special class of readers—give it to these in the plainest and fewest words possible,—saving *their time by our labor.*

Our Leading Departments

Will be continued under the following heads:

The Home Circle,	The Horse,
Young Folk's Column,	The Swine Yard,
Short Stories,	Sericulture,
House and Farm,	The Vegetable Garden,
Useful Information,	The Flower Garden,
Domestic Economy,	The Vineyard,
Good Health,	The Orchard,
The Dairy,	Tropical Fruits,
The Apiary,	Small Fruits,
Poultry Notes,	The Cereals,
Horned Stock,	Pasturage, etc.,
Sheep and Wool,	Fertilizers,
Goats,	Miscellaneous.

Practical Farmers

Know how important it is that the above subjects should be treated from a local standpoint—that generally the farming tactics of the East will not do for this coast, that agriculture, in its infancy here, can derive greater benefits from an exchange of experience through the columns of the press than in older fields. Constantly observing and studying developments in the special field we represent, we can be expected to give truer information on agricultural subjects, than more general writers at home or abroad.

Our Traveling Correspondents

Will do much service by gathering a large amount of interesting information from various parts of the Coast, which, but for their research and practiced observation might never be placed on record or reach the eye of the reading public. Of our many

Local Correspondents

We have particular reason to be proud. No paper on this Coast—old or new—has ever been so highly favored with volunteer contributions. They are talented, reliable, independent and generous representatives of an intelligent and enterprising people, noble types of good humor, unselfishness and true progress.

Short Stories,

Original and selected, will hereafter appear in each number. Their selection, we trust, will be such as to render them popular and unobjectionable to all. In addition to a large number of

Fine Engravings,

Representing Choice Stock, Farm Products, Scenery, Remarkable Productions, Improvements in Farming Implements and Machinery, Works of Art and the Beautiful in Nature, we shall from time to time present the modest

Faces of Prominent Farmers

Who, as pioneers in the development of agriculture on this Coast, or as active laborers in the "Farmers' Cause," are worthy of the distinction they enjoy, and the favor with which they are looked upon by our many readers at home and abroad.

Engravings (costing thousands of dollars originally) are inserted in our columns during a single year. They afford instant and perpetual impressions often more perfect and real than words can convey.

Patrons of Husbandry.

We shall continue to give our weekly summary of matters connected with the interest and progress of this growing and important movement. We shall aim to give information as fresh as possible in this department. Its readers are aware that the RURAL has been in the lead in calling farmers to organize. We shall continue to work zealously with the Granges for the noble objects of the Order.

The present is an

Important Period

In the history of our Coast. The coming 12 months promise greater developments in its agricultural progress than has been experienced in any previous year. Agriculturists are alive to improvements in every direction, and those who would keep up with the spirit of the times should certainly read the RURAL PRESS.

The S. F. Market Reports

Will receive greater attention in the department of DOMESTIC PRODUCE than that of any other weekly journal. We shall spare no pains to render the reports as reliable and complete as possible. By the employment of our special reporter we hope to make this very important part of our paper one of its best and most satisfactory features.

Kind Words and Acts

Have done much to build up in this isolated and sparsely settled coast so large and complete an agricultural journal as the PACIFIC RURAL PRESS. We commence the new year with a regular circulation of

Over 5,000 Copies,

A far greater issue than that of any weekly on this Coast, independent of a daily publication. If our friends will continue to "help us help ourselves," we hope to reach a circulation of 8,000 this year, and do a correspondingly greater service of good. While we have the greatest advantages and can make by far the best weekly for

Agriculturists on This Side of the Continent.

We cannot expect one-half so large a circulation as journals in older and more populous districts. Consequently readers cannot rightly expect such a paper here at Eastern rates.

No Premiums But a Good Paper

Do we offer. A flashy chromo (or cheap map), with an ill suited paper, will hardly satisfy the farmers of this Coast, whose time is too precious for trifling. To many of you the benefit of a reliable and valuable paper should reach a hundred fold its cost, while to all a poor journal would be dear at any price.

Sample Copies Furnished Free

On receipt of stamp for postage.

Agents are Wanted

Who will do more or less active canvassing. To such we will furnish free samples and pay liberally for their services.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a basis of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $24,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask nothing for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,

To Mining Secretaries.

An amendment to Section 236 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Eagle Quicksilver Mining Company.—Location of work, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—Is hereby given, that at a meeting of the Board of Trustees of said company, held on the 22d day of July, 1874, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessment shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before will be sold on Monday, the 28th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Rooms 5 and 6, No. 302 Montgomery street, San Francisco. jy-25

El Dorado North Mining Company—Location of principal place of business, 215 Sansome street, room No. 2, San Francisco. Location of works, Philadelphia District, Belmont, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of August, 1874, an assessment (No. 1) of fifty cents per share was levied upon the capital stock of the company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 215 Sansome street, room 2, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on sixth (6th) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. E. HOUGHTON, Secretary.
Office—No. 215 Sansome street, San Francisco, Cal.

NOTE—Since levying the above assessment, the office of the El Dorado North Mining Company has been removed to room No. 4, Hayward's Building, No. 419 California street, San Francisco, Cal., and said assessment is made payable to the undersigned, who has been duly appointed Secretary of said Company. FRANK SWIFT, Sec'y.
ag15

Germania Mining Company—Location of principal place of business, San Francisco, State of California. Location of works, Tintic District, Juab County, Utah Territory.

Notice is hereby given that at a meeting of the Directors, held on the fifth (5th) day of August, 1874, an assessment (No. 2) of one dollar per share was levied upon the capital stock of the company, payable immediately, to the secretary, at the office of the Company, 408 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the second (2d) day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. W. TRIPP, Secretary.

Office—No. 408 California street, room 16, San Francisco, Cal. ag15

Kincaid Flat Mining Company—Principal place of business, San Francisco, California. Location of works, Sonora, Tuolumne County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of August, 1874, an assessment of two dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 217 Sansome street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2 st day of September, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 12th day of October, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. H. CORNELL, Secretary.
Office, 217 Sansome street, (up stairs.) San Francisco, California. ag22

Manhattan Marble Company of California. Location of principal place of business, San Francisco, California. Location of works, Oakland, Alameda County, State of California.

Notice is hereby given, that at a meeting of the Directors, held on the 26th day of August, 1874, an assessment (No. 5) of two dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary of the company, at his office, No. 212 Sansome street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 29th day of September, 1874, shall be deemed delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 20th day of October, 1874, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. A. B. CLASON, Secretary.

Office—No. 212 Sansome street, San Francisco, California. ag29

Plumbago Gold Mining Company—Certificate of incorporation dated and filed in the office of the County Clerk of the City and County of San Francisco, California, June 24, 1864. No. 2340. Mine and works at Plumbago Ledge, Sierra County, Cal.

TO ALL WHOM IT MAY CONCERN TO KNOW: The representatives of two-thirds (⅔) of the capital stock and stockholders of said corporation, having made and filed with the Board of Trustees, on the 4th day of August, 1874, their written assent that the place of business of said corporation should be changed from the City and County of San Francisco, to Minnesota, in Forest Township, Sierra County, Cal.

Notice is hereby given, that it is the intention of said corporation to remove the principal place of business from the City and County of San Francisco, to Minnesota, in Forest Township, in Sierra County, immediately after publication of this notice for the period of thirty days from its first insertion in the MINING AND SCIENTIFIC PRESS, a newspaper printed and published in the City and County of San Francisco, Cal. Done by order of the Board of Trustees. S. B. DAVIDSON,
Secretary Pro. Tem.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverising and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the perticles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

v22-3m16p General Agents, No. 210 Front Street.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, haryta and quartz; and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

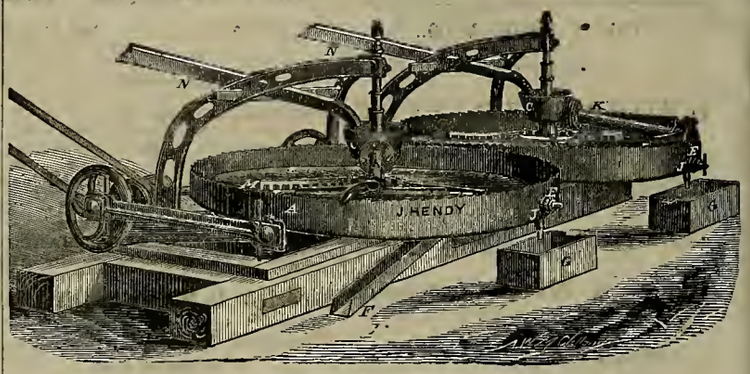
THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator,



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1874.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and buddles formerly in use.

O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection.

E. R. BURKE, Superintendent.

For description send for Circular.

JOSHUA HENDY, San Francisco.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 5, 1874.

VOLUME XXIX Number 10.

Machinery for Generating and Applying Power.

In continuing our general review of the Fair, we naturally pass from Raw Products to the means by which such products are modified and made more useful for man than it is possible for them to be while in their natural condition. To accomplish this work, *power* is required. The sources of power available to the wants of man are—animal exertion, wind-power, water-power and the motive power of heat. The machines and engines by which these powers are made available will form the subject of our present article.

Although, by common consent, we enumerate *four* sources of power which may be adapted to the uses of commerce and manufacture, there are in fact but two—heat and animal exertion; for both wind and water-power, as well as steam, are due to heat, which, in the first case, produces local expansion of the air, which causes wind; and in the second effects vaporization, which replenishes our falls of water—just as in the third but under different circumstances, it provides the engineer with steam.

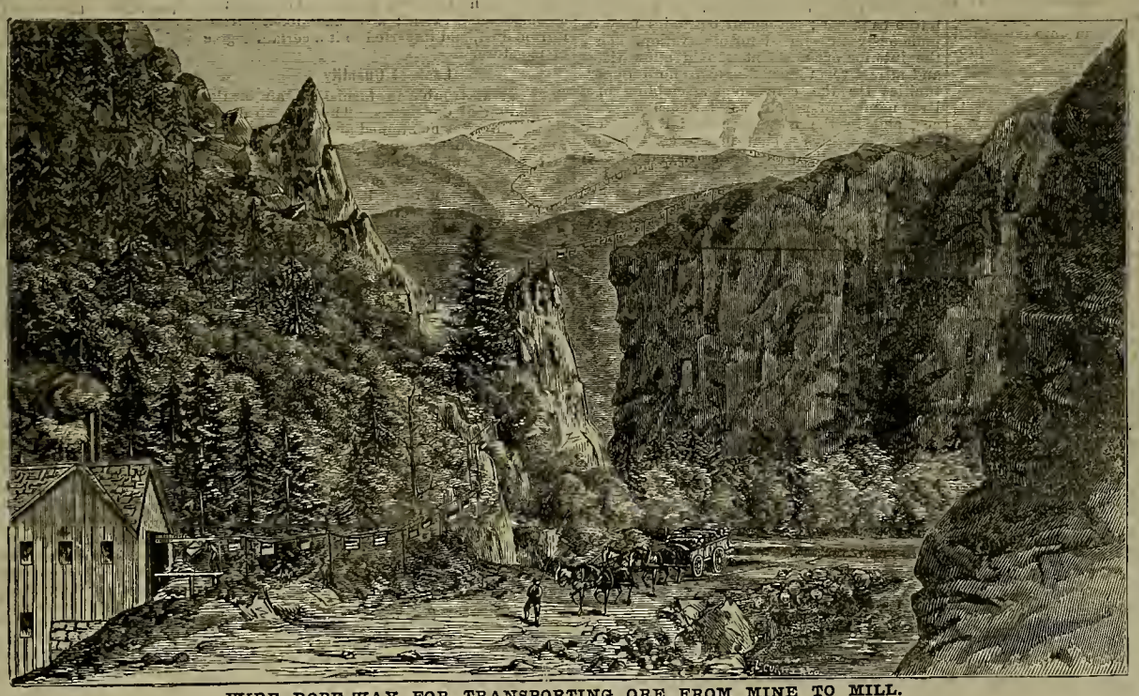
The Steam Engine,

As the recipient and disburser of the power of heat, and the means most generally in use for the application of power, demands our attention as the most important prime mover. It is also more perfectly exemplified in this Exhibition than any other of this class of machines. We have here two first-class engines, probably as perfect in their make, for service, as any which can be found. We have also several smaller ones, of various powers and forms of construction, calculated for the different kinds of work to which this universal power-dispenser is applied.

The history of the steam engine, from the early and rude contrivances by which the employment of steam was first made practicable, down through the great variety of forms through which it has passed, in the course of the infinite variety of purposes to which it has been applied, forms the most interesting chapter in the whole history of the world's progress in industry and art; but we have no time nor space here to dwell upon it. Our business now is with the present and practical.

The economy of the engine depends upon the cost of the generation of steam, and that, in turn, depends mainly upon the construction and mechanical arrangement of the boilers where it is generated. Different kinds of fuel require different modes of construction for the furnace. A ready, full and perfect combustion of the fuel, even to the smoke and volatile gases, is an essential requisite to an economical employment of steam power; and there has been almost as much study expended to secure the proper construction of furnaces and boilers as has been devoted to the improvement of the engine.

Go with us to the little unpretentious shed just outside the north door which opens out from the machinery department, and let us examine the source of that quiet yet giant power which puts in motion all the scores of machines, large and small, which go to make up the sum of the machinery which is now or may yet be put in operation in that department of the Exhibition. A few shovelsful of coal and an armful or two from that pile of carpenter's chips, now and then thrown into the open doors of that glowing furnace, generate heat which is taken up by the water in that huge boiler and conveyed thence, in the form of steam, through that great arterial pipe which you see running from the boiler into the Pavilion; where, branching off in various directions, it furnishes the motive power, not only for the two large engines which drive the main line of shafting, and the huge rock-drilling machine which stands by its side, but also for numerous smaller engines located in different parts of the building, even as far as to the threshing machine which stands near the Market street entrance. That heap of carpenter's rubbish and those few shovelsful of fine coal, which your cook would reject as worthless, are thus converted, as if by magic, into a power which has printed the paper which you are reading, and which will saw your wood, grind your wheat, weave your cloth, sew your garments, plane your boards, plow your soil, and in fact do almost anything which man can perform, except to think or talk. All this is accomplished by steam which has been produced by the combustion of the heaps of rubbish which a few moments since you saw in front of the boiler furnace. But our introductory remarks have extended to a greater length than we had intended, and we must defer any particular examination of the engines until the next issue.



WIRE ROPE-WAY FOR TRANSPORTING ORE FROM MINE TO MILL.

Chromatee.—A party of Vallejoites are about to organize a company, with a capital of 500,000, for the purpose of manufacturing chromates. They have already secured an immense amount of chrome iron, from which to manufacture the various salts of chromium that are demanded by the market. The projectors of the enterprise have made arrangements to have a superintendent and a force of workmen sent out from the factories in Glasgow, Scotland. They have plenty of material to work on, but it remains to be seen whether they can break up the powerful monopoly already in the business.

The silver excitement at St. Helena is on the increase. Parties, principally from Calistoga, were out all of Tuesday night and the night before, making locations.

A well defined and rich ledge of silver ore has been discovered in Pope valley, about 20 miles northeast of Vallejo.

Shasta County Mines.—Mr. R. F. Hallock, of Shasta county, speaks very encouragingly of the quartz prospects in his county at present. The Washington mine, at French Gulch, will commence operations again shortly. They have a 15-stamp mill with pans and machinery complete. Mr. Lewin, the superintendent, says he has taken, altogether, almost three-quarters of a million from the mine. They have some 1,500 tons of sulphurets, the lowest assay of which gives $66.14 per ton. About 40 tons of concentrated sulphurets assay $200 per ton. Several mines at Whisky-town are working with arrastras. One of them has been working this way on $20-rock for a year. There is some little excitement in the county, at present, about prospecting for coal. There have been several late discoveries of argentiferous galena. Mr. Hallock showed us assay certificates of ore from the New World mine, in Cow Creek district, six miles north of the Peck mine, which mine is now being opened. Some of the ore contained $28.46 in silver, and 52½ per cent. lead.

San Juan.—Some one who appears to write as if he was posted, says of Animas district, San Juan: There are but very few of the mines that have been developed sufficiently to profit their owners: but there are hundreds on which the annual assessment, as it is called, has been worked out. The chief occupation of the miners thus far this season has been in working out these legal assessments, and only until quite recently have they been able to get reliable assays. Some of the assays reported from there would astonish even a Utah miner sharp, leading the uninitiated to suppose that the ore was about 75 per cent. silver, etc. The correspondent alluded to above is very sanguine, and says: In every instance which has come to my knowledge the ores are improving as the miners go down on their veins. Even a slight excavation in some instances gives surprising results.

The largest bridge necessary to be built on the San Luis Obispo railroad is now completed. It is 50 feet high and 1,000 feet long, and capable of bearing, with safety, a 40-ton engine.

Work was recommenced at the coal mines of the Pancake company on Monday last. The shaft at present is at the depth of 317 feet, and is now in three feet of good coal.

Endless Wire Rope-way.

At the upper end of the Mechanics' Fair pavilion is placed one of Hallidie's patent wire rope-ways for transporting ores from the mine to the mill. We have before described this apparatus in detail, and give this week an illustration showing the general arrangement of the rope-way, where it is erected in a mountainous country. Some improvements have recently been made in the buckets, etc. The buckets are now arranged so that the bottom is opened by suitable contrivances at the dumps by the mill, and on the load being discharged it closes automatically. Several of these ropeways are now in use on this coast and are giving satisfaction.

One can readily see the many advantages this method possesses in mountainous regions, from the fact that it requires neither expensive machinery nor roads; that it can be run at all seasons of the year, even when there is a great depth of snow on the ground; that it can be cheaply constructed in the worst possible country; and that where there is sufficient grade not only does it run itself by gravitation, but produces a motive power at both ends of the line. Running at 200 feet per minute, the cars are carried down on one side of the posts and up the other, 240 per hour, each delivering 100 pounds of ore or 12 tons per hour, and they can be run day and night continuously. The total cost of laying down the endless way is from $6,000 to $12,000 per mile, and the cost of carrying the ore is about 12 cents per ton per mile.

No Quicksilver in Nevada.—The Virginia *Enterprise* is surprised that they have found no quicksilver yet in Nevada. It says: While the people of many sections of California are running crazy over quicksilver mines, the only way in which our people are slopping over from their legitimate business of silver mining is in the direction of stone coal; and even on this they are not very wild. We of Nevada have, on a few occasions, tried to become excited about quicksilver, but we never could find anything to serve as a starter. Lumps of red jasper are sometimes brought to our assayers by prospectors, who are almost ready to think that they have got hold of the world in the right place; but no genuine cinnabar has yet been found in the State. This is rather strange, as we have a little of almost every other metal and mineral.

Extensive preparations are now being made at the Pinto mill, which has lately passed into the hands of the British mining company. The machinery is being put in thorough repair, and wood and coal are delivered in large quantities. A large amount of ore is also being brought to the mill from the mines in Newark and other districts.

Several nuggets, averaging in value from $1.50 to $14, have been found at the newly discovered gold mines on Dry Gulch, near Connor Creek, Oregon.

The experiment of making paper barrels is being tried at the Vallejo barrel factory.

Raw Produots at the Mechanics' Fair.

The Managers of the Ninth Industrial Fair have very properly placed raw products first in their list of classification. A knowledge of raw products sbould always be the first considera- tior with every reading and thiuking person, since it is an essential prerequisite for the at- tainment of every material good. Every pur- suit, whether for the necessity, convenience or luxnry of man, has its beginning and end in the procurement and workiug or modification of raw products. Raw materials are usually found in particular localities, and generally iu great abundance, and at small expense of labor or skill. It is their adaptation to the wants and conveniences of man that calls out ingen- uity and demands skilled labor, and it is this which brings honor, and power, and wealth to a nation. Still, he who provides the raw ma- terial is just as essential, in the great hive of industry, as he whose more defty handiwork fits it to our needs.

The position of California, with its great commercial center at the gate of the Pacific ocean, is a most important and anomalous one in the industry of the world, whether in the original field of raw products, or in the more advanced one devoted to their multifarious modifications. First brought prominently be- fore the world by the extraordinary richness of her mountains in mines of gold and silver, she has since reached an equal prominence by the wonderful adaptability of her valley soils to the production of the golden grain, aud other fruits of the earth, which go to feed aud nour- ish man and beast. The raw products of Califor- nia, both miaeral and agricultural, are each in their way effectiug giant strides in the advance- ment and extension, not only of our own coun- try, but of the world at large. Cousidering the importance of this class of products, and the abundance with which nature is handiug them out with the least possible amount of toil, it is much to be regretted that so little attention has been paid to introducing them into the grand industrial display now in such successful pro- gress in our midst.

Mineral Products.

First in the order of arrangement under this head are placed minerals, including ores, rocks, earths, salts, coals, petroleum, unwrought met- als, etc. Mr. H. G. Hank's display of min- erals is the only thing worthy of especial men- tion in this direction, and this is really fine— indeed, it is a prominent feature in the Pavil- ion, and has been set up at great expense and in the very best style and taste. It is a very complete and methodical cabinets, embracing not only the ordinary minerals found in first- class cabinets, but a wide range of those more rare and curious, embracing a large num- ber of valuable specimens of gold and silver. It is just the collection needed by such an institution as the Academy of Sciences, or the State University, and just such an one as every person should have access to in order to be- come in auy degree familiarized with the sub- ject of mineralogy. It is the result of many years of labor and the most careful attention of the best practical mineralogist on the Pacific coast. The exhibition is a credit both to the owner and the Institute.

Aside from this, however, snd a very credi- ble exhibition of salt, by the Carmen Island salt works, and a show of coal in bulk, from the Renton Coal Co., located at Seattle, Washiagton Territory, we find nothiog in the mineral line except the sample exhibits of the enterprising proprietors of the San Francisco *Journal of Commerce*, who have done what they could to keep up the reputation of the State by displaying, in samples, chrome iron ore from Del Norte county, pig iron of various qualities from Oregon, mangaaese from Red Rock, etc.

Vegetable Products.

In regard to vegetable products, which are even more abundant and, with the exception of iron and coal, far more important than mioer- als, we find a very small display. Had it not been for the publishers of the *Journal of Com- merce* this great industry would have been almost entirely ignored. These gentlemen finding, just as the exhibition was about to open, that no space had been taken for vegeta- ble products, outside of the horticultural de- partment, hastily gathered together samples of cereal and other products with which they are enabled to make a very creditable exhibition. They have in their collection about 50 varieties of wheat; 20 of oats; 14 of barley: several of corn, beans, peas, etc. There are shown sam- ples of different grades of cereals from Cali- fornia, Oregon, Australia and the Mississippi valley, placed in contrast with cereals from the various parts of Europe. Not less than 100 samples are shown from the great wheat centers of Southeru Russia, Huagary, etc.

Flour of various brands is also shown, and samples of dried fruits, hops, etc. The latter exhibit is quite interesting, as showing the in- creased vigor of growth manifested by the hop plant iu this State over auything met with else- where. Experts tell us that a similar superi- ority is observable in the intrinsic value of the hop, for all the uses to which it is applied.

Mr. Horace D. Dunn makes a fine show of woods from Japan, which were forwarded by the last steamer, with a view of bringing them to the attention of cabinet makers, carriage makers, etc. These woods can be laid down here muoh oheaper than they can be obtained from the Eastern States. They consist of thirty va- rieties; are from the Island of Yezo, of which Hakodadi is the port of entry.

Mr. Henry F. Stivers makes a very fine sam- ple show of California woods iu the western galleries.

The only show of raw fibers consists of a fine display of California wool, California cotton shown in contrast with that from the Marquesas Islands, exhibited by the JOURNAL OF COMMERCE; and a small lot of jute, showu by the S. F. Cordage Company, and another by the Pacific Jute Manufacturing Company, of Oakland.

The horticultural exhibit will be noticed in another connection.

The Centennial Buildings.

The following facts concerning the forth- coming Centennial Exhibition are of special interest to those visiting our own Industrial Exhibition.

The estimates vary from $2,871,500 for the temporary industrial palace aloue, built en- tirely of combustible materials, and without any permanent memorial hall, up to $10,050,- 000, which includes a permauent memorial hall, built of iron aud brick, with heating ap- paratus, organ, etc., complete. The Building Committee is of the opinion that it is best to have separate buildings for the Exhibition, and recommends the erection of the following structures: The Art Gallery, covering one and a half acres; the Grand Pavilion or main hall, covering thirty-six acres; the machinery hall, covering ten acres; the agricultural hall, cover- ing five acres; the conservatory and, from time to time, smaller buildings as they are needed. The committee reports that the Graud Pavilion, which is a temporary construction, must cover a minimum of thirty acres of ground, and be capable of extension, if required, as the work progresses. That it must he rectangular in plan and without curved corridors, and that no galleries must be constructed for exhibition purposes proper; but small balconies may be judiciously introduced for observation. That the interior arrangement should allow vistas and attractive promenades, and sfford oppor- tunities for the convenient assembling of a large number of people, as at Sydenham Pal- ace, and in the most successful English ex- hibition buildings. That in the construction the reduplication of parts should be an essential feature; that iron and brick should be the principal parts of the structure, in order to afford a reasonable protection against fire.

The plan of the mammoth building is rec- tangular, being 2,040 feet long by 680 feet wide, with greater width at the center and eads up to 952 feet. The governing dimension on the plan is a square or pavilion measuring 136 feet on each side. The main parallelogram forming the building is therefore fifteen of these pavilions long, and five pavilions wide, an area equal to 31.84 acres.

These particulars will give a faiat idea of the vastness of the magnficent structures. The Mechanics' Pavilion here, in San Francisco, covers but four and a half acres, aud yet we look upon it as something colossal. It would barely stop a hole in the big Centennial shanty.

THE CORNUCOPIA DISTRICT MINES.—A. D. Meacham, of Cornucopia district, arrived here this morning. He speaks very encouragiugly of the miues in this district. He has great faith in them, and he comes here for the pur- pose of making arrangements for a mill. He desires a mill of ten stamps, for which a spring in the immediate vicinity of the mines will af- ford an ample supply of water. Wood is about sixteeu miles distaut, aud will cost about $13 per cord. The principal miues in the place are the Leopard, Black Diamond, Chloride, Carrie, Morning Stsr and Constitution. The Chloride, Black Diamond, Leopard and Con- stitution companies are at present hauling ores to Winnemucca for reduction. The ores pay as follows at the Winnemucca mills: Chloride, $600 and over per ton; Black Diamond, $526; Leopard, $317; Constitution, $193. There are now on the dumps of the several miues named about 1,500 tons of ore, with more than as much more in sight. The Carrie company have as yet had no ore reduced. Their assays run from $80 to $100, thongh they have of late had ore assaying over $300 per ton. The pop- ulation of the town of Cornucopia is about 100, 75 of whom are voters. There are but three women in the town. One of these is Mrs. Carl York, who formerly resided in this city. Mr. Meacham is of the opinion that the population of the place would be donbled or trebled by the erection of a mill.—*Virginia Enterprise.*

NON-POISONOUS FLY PAPER.—Pnt one pound quassia wood in five pounds water, and let it stand over night in a warm place. The decoc- tion is then boiled down to about two pounds. The wood is afterward put in two pounds fresh water, and boiled down to one pound. The two decoctions are mixed, one-half to three- fourthe pound of sugar added, and paper passed through it, drained and hung on lines to dry. Ordinary unsized blotting paper is usually employed, and may have something printed upon it before saturation with the quas- sia solution.—*Jour. of Chem.*

A LAW iu Austria prohibits apothecaries from the manufacture of artificial mineral waters, and forbids to name any artificial product after any spring iu imitation of which it may have been made.

Ventilating and Cooling Mines.

A great number of machiaes of varions kinds have been invented for cooliag mines, and at the same time cooliag and purifying the air used. Even in surface ventilation—that is, the ventiiation of large and crowded buildings—it has been thought worth while to cool the air used. Thus we learn that about a ton of ice is used every night to cool the air that is pnmped into the English House of Commons. The air is forced through water and ice; and, being fil- tered, is freed of dust, and rendered perfectly pure. In a number of papers we have of late observed a laudatory account of a piston ma- chine,

A Sort of Wooden Churn,

For the ventilation and cooling of hot aud deep mines, which it is thought should effectually do the required work and at once settle the whole question of ventilating and cooliug the lower levels of even the deepest of our mines. This apparatus, as described, is simply au elongated box, inside of which a large piston works, tak- ing in and forcing out air at both its up and down strokes. The bottom of the box is filled with water; the air on entering circulates abont the water and is moved dowu on it in snch a way as to cool the air before it passes ont into the mine. The box is of wood, as is the piston, and no lubrication is reqnired. The smallest machine, it is said, delivers with a six-foot stroke 3,732,480 cnbic inches of cool, condensed air into the interior of the mine in one minute.

A Spray Box.

Now, au apparatus similar to this, though an improvement on it, has been tried in some of our mines, but failed to do the required work. The apparatus used here for cooling the air was less complicated than that described above. It was simply a square wooden box, extending up a hundred feet or so from the bottom of the mine, into the upper end of which the air pipe from the blower on the surface is entered. At the top of this box was injected a small stream of water, which falling through the air the whole length of the box could not but cool it to a cousiderable extent; also, undoubtedly freed it from dust, and imparted to it a certain degree of moisture.

Lack of Quantity

Is the great trouble in furnishing air for the ventilation of our mines. There is no donbt that the devices mentioued above—particularly the latter—cousiderably improve the quality of the air furnished, but it cannot be expected that by simply cooling, moistening and pnrify- ing a small stream of air it can be made to suf- fice to ventilate a section of a mine where it previously proved inadeqnate. What is wanted is, in the first place, the largest possible vol- ume of air.

Force Pumps and Blowers.

Force pumps of all kinds have been tried on the Comstock for pnmping air into the mines, but they have all been abandoned. No machine has yet been found which surpasses the Root blower for this nss. The larger the pipe is, leading from the blower down into the mine, the less is the resistance to be overcome by the blower in sendiag air down to the lower levels.

Larger Air Pipes Required.

With a small pipe the air backs npon the blower and there is a loss of power. The pipe should he so large that there is no longer any perceptible back pressnre—so large that all the air blown into the pipe finds an abnndance of room in which to advance without encounter- ing the resistance of its own elacticity. There should be no more compression in the pipe than is necessary to urge the air to its destina- tion. This is the true plan of getting all the work out of a blower that there is in it. Our mining companies have steadily been increas- ing the size of the air pipes, but they are not yet large enough; they should be at least three feet in diameter.

Blowing in or Sucking Out.

It is a question in many minds whether we have gone the right way about the ventilation of our mines; whether instead of forcing fresh air dowu into the lower levels we shonld not pump the foul and heated air out, when pnre air would rush down to fill the vacuum thus created. In the mines of Germany they prac- tice this plan of pumping out the foul air. Here, it is not likely that it would work as well as the plau of pumping in fresh air. In pumping out, as well as in pumping in, there would be a main pump running down to the lowest level of the mine, from which would he extended branch pipes leading to all the princi- pal chambers and drifts where work was being done. We will now take the case of a drift in which men are at work. By our present plan of blowing in tresh air there is always more or less good air at the face of the drift about the end of the pipe, but in case of the pnmping- ont plan the air immediately about the end of the pipe would be sucked into it and the only air that would reach the men wonld be that coming from behind, flowing for a long dis- tauce in contact with the heated rock forming the walls of the tunuel or drift. In this country we work so fast that the rock does not have time to cool behiud us. This is why we must ventilate by a plan the reverso of that practiced in the Old World.

About Cooling the Air.

When we have forced into a mine all the air we can get into it by the best apparatns kuown to us it is then that we may think of the little refining touches of straining and cooling it. It is of little use to cool the air on the surface as it wonld be abont as hot as the air ascending the main shaft by the time it had reached the lower levels. About as good a plan of cooling the air below as we can think of would be to have the main pipe discharge into a wooden box or receiver, about eight feet square and ten feet in hight, in the top of which, upon a sort of lattice-work, was kept a qnantity of ice under a closely-fitting lid. From this air-chest the distributing pipes might radiate in all directions. The ice in the top of the chest with the shower of water dripping from it as it melted, would both cool and moisten the air. The bottom of the chest being lined with zinc, there would be contained in it a constaat snpply of ice water for use in the mine. Bnt the first thing is to get a proper volume of air into a mine; the cooling and moistening our miners can probably dispense with—not being quite so fastidions as the members of the House of Commons.—*Terri- torial Enterprise.*

Gravel Mining in Calaveras County.

None of the interests of this section, saye the *Chronicle*, are in a more flourishing condition than gravel miniag. Work is being bnsily prosecuted in the various hydraulio and tnnnel claims, with, we are glad to say, the best of results. Indeed, more gold will he taken out of this portion of the county the present sea- son, as the result of gravel mining operations, than during any previons year for a decade past. Great progrese has been made, latterly, especially in hydranlio mining. In fact, so rapid has been advancement in that respect that Calaveras now rivals the northern counties in the magnitude of that species of operations. And the limit of progression in that direction is not yet reached, by any means. New loca- tions are constantly being made, and the mines are of such a permanent character that their yield will increase annually.

Alexander & Co,, owners of the "old Bob Paul claim," are getting along well with their new tunnel. It is in a distance of 275 feet, and it is expected that pay gravel will be struck in a few days. The tunnel is an incline, follow- ing the pitch of the bed-rock. It is probable that washing will be resumed within a couple of weeks.

Duryea, of the Chili Gnlch hydraulic, is run- ning tunnels for the purpose of pntting in blasts. He has an immense bank of pay grav- el, but it is so hard that it is difficult to pipe. When shattered by blasting, however, it wash- es readily. The claim is one of the most ex- tensive in the connty and is well handled.

Veith & Co. are pushing things in their hy- dranlic in Tunnel ridge. They employ a large number of men and use a great quantity of water. This mine is systematically worked and yields an average of abont $3,000 per month.

Moser, proprietor of the Spring Gulch sluic- ing claim, is not driving ahead with his usnal vim at present, beiag employed in putting his mine in shape for the fall campaign. Active operations will be resnmed shortly.

Cook & Co, are washing away Sport hill as fast as water and mnscle, energetically applied, can do it. They are, in the fullest sense of the term, "drivers." Work is constantly prosecu- ted with the utmost vigor, and we are glad to know that their industry is well rewarded. Without interrnption of washing they are run- ning a tuunel iu which to lay their slnices in order to give them a better grade. The work is progressing rapidly.

Emerson, the Happy valley hydranlicer, is still engaged laying down flume. Hie line of slnices will be about three-fourths of a mile in length when completed. Emerson intends to make things howl when he gets a "good ready."

Drnmm & Co. are working the Lone Star claim, in Happy valley, steadily. Good prog- ress is being made, and the prospects are flatter- ing that the mine will prove a very remnnerative one.

Evans & McCann, engaged in running a tnn- nel into Tnnnel ridge, have not got throngh the ledge yet. They have abont 30 feet to run. The rock is as hard as flint, but the boys will "get away with it."

Brackett & Co. and other miners along the ridge are working away indnstriously with fair prospects.

HYDROPHOBIA.—The fact is that canine mad- ness, technically *rabies*, is more prevalent in winter than in summer, in cold countries than in warm. Readers of Dr. Kane and other Arctic explorers will remember the freqnency of the disease among sledge dogs in the depths of Arctic winter. On the other hand, in the West Indies, where the climate is hot and dogs are abundant, the malady is rare. The Sonth- ern States and the conntries of Southern En- rope are notably exempt from it, while it is very common in Northern Enrope, in Canada, and throughout our Northern States. Statistics show also that more animals go mad in Jannary, February and March than during any other season, the fewest cases occnrring in summer time. It is also a mistake to snppose that hy- drophobia always follows the bite of a mad animal, or is necesarily caused by snch a bite. Between 1863 and 1868, there were 320 persons bitten by rapid animals in France, and hydro- phobia ensued in only 129 cases, less than half. According to Faber's statistics, out of 143 persons bitten by rapid animals in Wur- temberg, only 28 had hydrophobia. Having inoonlated a large number of animals with the saliva of fabid speoimens, he succeeded in communicating the disease in hut 23 per cent. of the animals operated on, 77 in the hundred escaping.—*Scientific American.*

SCIENTIFIC PROGRESS.

Photo-Mechanical Engraving.

Tha attention o! experts, both iu this conntry and abroad, has of late been largely taken np with perfecting the methods for producing or copying engravings by a combinstion of photographio with mechanical means. For a long time, it seemed that the arts of photolithography and photo-plate printing were the limits beyond which it was impossiblo to pass with any snbstantial practical results.

Qnite recently, however, pnblio atteution has been attracted to the performance of a process styled by its operators, "Photo-Engraving," which beyond question effeotnally solves the problem of the cheap, rapid and faithful production or copying of engravings, to a degree which promises to fully realize all the demands which can be made upon it. Of the precise nature of the details of this process, we are not able to communicate more than to state that its efficiency dependa mainly npon the peculiar photo-chomical propertiee possessed by gelatin, and various guma, when treated with bi-chromate of potassa.

It is possible to produce with its aid metal plates in relief of any engraving, whether in linea or dots, (and of conrae of any original pen design). This plate may be either an eleotrotype or atereotype, as may he wished, and this may of conrse be printed in the ordinary typographioal press. This plate may either be enlarged or roduced in size, as may be wished.

In this resides the great advsntage of photoengraving, or the photo-mechanical production of relief metal blocks, over photo-lithography and allied processes, bnt its advantage for reproducing line or dot engravings, or original pen sketches, are especially manifest for the almost innnmerable forms of newspapers and catalogue advertising; for book and other illustrations. Iu short whenever a line engraving is needed, whether it be an original or a copy, it is possible to have the same prodnced with exqnisite fidelity, snd, it is said, more cheaply than by any other process yet devised, and far more so than by the neual aystem of wood engraving.—*Trade Journal.*

STEEL.—Blistered steel will resist a far higher degree of heat than highly carbonized cest steel, and good shear steel will endure a white flame heat without injury; also a welding heat, if subsequently bammered. Although iron will hear a higher degree of heat than steel, yet steel will bear a far greater amount of hardship nnder the hammer than iron; that is, if the steel is cantionsly heated. Good cast steel, which is suitable for the best kind of cutting tools which have to endnre a great amount of hard work, will not bear a white heat without falling to pieces; it will hsrdly austain a bright red heat without crumbling under the bammer, but at a middling or oberry red heat it will bear drawing under the hammer to a point as fine aa a needle. Interior steel, whether at a high or low heat, will not take such a fine point without splittiug; and steel which will not take a fine point will not receive a fine, firm edge, however skilfully the hardening aud temperiug may be performed.—*Iron Age.*

OXIDIZING POWER OF CHARCOAL. — Hofman statea that when a freshly-prepared solntion of lenk-auiline is dissolved in alcohol, the solution is colorless and remains so for a long time. If, however, a small qnantity of .finely divided animal charcoal, euch as is daily employed for decoloriziug solutions, be thrown into the solution and then boiled for a few minutes and filtered, it will be found that the solution has acqnired a deep osrmine-red color. The oxygen condensed in the pores of the charcoal has converted a considerable quantity of lenk-aniline into rose-aniliue.

LITHOGRAPHED NEWE.—One of the most singular applicatione of lithography is that adopted in France by the Havas Intelligence Agency. This company, established in Parie, supplies the provincial papers with newe and original matter of various kinda. Inetead of being printed on elips by an ordinary prees, this matter is lithographed on a large sheet on one side only, so that it cau he cut up. The varietiee of handwritiug which are reproduced on these slips are said to be curious in the extreme.

CURIOUS PROPERTY OF TELLURIUM.—The salte of tellurium have the property of imparting to the perepiration a most offensive odor. It ie eaid that Dr. Buuseu, who experimeuted on his own pereon, wae compelled to absent himeelf from eociety for four weeks on this account. It is suppoaed that tellurium will never be used extensively as a medicine.

A NEW proceee for heliographic engraving is giveu in *L'Annee Scientifique.* A photographic proof is applied to a sheet of zinc, when the silver, transferred from the paper to the plate, prodnces a metallic layer which enables the zinc to be attacked by very dilnte aoids.

WIND INDICATORS.—Iu a communication to the *Academie des Sciences,* M. Tany objects to vanes as iudicatora of the wind, aince they indicate a directiou when there ie no wind, and they do not indicate the force of the wind. He would aubetitute a flag anspeuded by a cord from a metallic riug pulleyed on a vertical rod.

ACTION OF EARTH AND OTHER SUBSTANCES ON ORGANIC MATTER.—At a recent meeting of the Chemical Society, a paper on the action of earth on organic nitrogen, by E. C. Stanford, waa read, in which the anthor gave details of his experience on mixtures of earth and decomposing animal matter. From these it appears that the earth is but an indifferent drier, the mixture contiuuously loeing nitrogen, which ie evolved as ammonia principally; the earth also does not act as an oxidizer, and no nitrification takes place. Dr. Frankland stated that when decomposition was in the etate of pntrefaction, ammonia was always produced from the nitrogenous matter, bnt much nitrogen also escapee iu the elemental form. The action of charcoel is very different; seaweed charcoal mixed with excrementitious matters and allowed to dry is found to retaiu almoet the whole of the nitrogen. These facts are of interest to sewage economiste and the advocatos of the dry-earth system.

A TERRIBLE TORPEDO.—The *Borsen Zeitung* says that the German Admiralty has decided 10 adopt a new kind of torpedo, which cau be moved about while under water from the shore. The weapon consists of a long, hollow cylinder, containing, besides the fulminating powder, a sufficient quantity of air to eneble it to float. It is moved by means of electric cnrrents passing through wires which connect it with the land, and by an air-propelling apparatus also fixed on the shore. The speed of this torpedo can be raised so as to exceed that of the swiftest ships. A detonating apparatus is attached to it in front, which explodes on contact with any solid body. A nnmber of torpedo boats are also to he built for the purpose of pursning hostile ehips aud attacking them unobserved. These boats will he propelled by a screw moved by hydraulic power, and will be steered under the water by means of a compass. They are to be capable of performing four days' joarney at sea.

SENSIBLE.—A very oommon mistake, says a contemporary, with writers on scientific and mechanical topics ior popular perusal, is the indulgence in technical terms and algebraic formnlas to an unnecessary extent. Such writings often fall fer ahort of comprehension by the readers to whom they are addressed. It does not need that the acientific writer ahould "stoop to conquer," or simplify his lucubrations to childish degree, but good plain English, which persists in calling a spade a spade, ahould he used in all cases; leaving mere jsrgon of nomenclatnre to the society meeting, or the scientific quarterly. It is no disparagement to working mechanics that they do not generally understand these things; siuce it is eometimes a matter of doubt whether the writers do themselves.

A POWER SUPPLYING COMPANY.—The Rochester (N. Y.) Hydraulic Co. carries on no manufacture, bnt rents its buildings to various msnufacturers, supplying the power to them from the water flowing in the river beside the shops. A short time ago the rock was cut so as to make a deep well, aud two of the largest water wheels, yielding over 1,000 horse power, were placed therein. It is the intention of the owners to add another wheel, which will swell the power attained to over 1,500 horse power. —*Commercial Bulletin.*

PALM PAPER.—Mr. James P. Herron, of Washington, D. C., has iuvented a process of making paper from varieties of the palm. Tue material is cut or torn in pieces of suitable size, then cooked in a close digester, with thorough agitation and under steam pressure, iu a weak solution of alkali, naptha, benzine, or soap; then it is completely ground, while steam passes freely through the grinder and intermingles with the stock, reducing, bleaching, and finally washing it.

COLORIMETRIC TEST FOR AURIFEROUS QUARTZ. The quartz, after being well ground and calcined, is treated with a bath of iodine or bromine water, and allowed to digest in it for eome time. A piece of filter paper is then soaked in the solution, dried and burned to ashes in a muffle. If gold is present the ash ie purple. One dwt. of gold to the ton may thns he detected.—*La Naturaleza.*

BARYTA GLASS.—Experiments made by Dr. Benrath for determining whether carbonate of baryta may be employed in the manufacture of glass indicate that this eubstance may replace the lime but cannot take the place of potash and eoda.

"A KNOWLEDGE of science attained by mere reading, though infinitely better than ignorance, is knowledge of a very different kiud from that which arisea from contact with fact." —*Huxley's Physiology.*

ALUMINUM has been coldered by first applying a layer of copper with the battery, and then epplying the solder to the copper. It will not bear much tensile strain, becauee the copper does not adhere very firmly to the aluminum.

THE analyses of fertilizers, for the purpose of the control of the trade in these articles, are becoming year by year more common, and their necessity better understood.

ARAGO saye that "he who, outeide of the range of pure mathematics, uttere the word *impossible,* is wanting in prudence."

MECHANICAL PROGRESS.

BALLOON STEERING APPARATUS.—Bowlder's steering apparatus consists of a screw propeller like that of a ship, of metal, bnt made as light ae poesible, and is to be fixed to the car horizontally, and made to turn at the rate of about 14 revolutiona per second, hy meana of some simple mschincry worked by a single handwinch in the car. A similar screw, fixed vertically, aud worked hy the same gear, is designed for rsising and depressing the balloon without any expenditure of gas or ballast, and a disc-shaped rndder of canvas to steady the balloon completes tha apparatus. Mr. Coxwell, the well-known aeronant, nnneh prefers the small screw propellers, which are but three feet in diameter, to those proposed by a French aeronaut, which are to he 16 feet high, and are therefore regarded as unmanageable and dangerous to the balloon, especially in the descent. The screws will probably he made somewhat larger if the first trial is in the least degree eucoessful; but it is considered preferable to increese their power, if necessary, by multiplying the speed of revolution hy the use of some other motive power thau manual force, either electricity or atmospheric pressure, or even the steam-engine—an agent which has hitherto been discarded on account of ita necessary weight and the risk attending it.

HYDRAULIC GUNNERY.—It may safely be affirmed that with our present heaviest guns of 35 tons weight, the limit of aize whioh can be efficiently worked by hand power has already beeu reached, if not exceeded, and that in view of the fact that gnns of more thau donble that weight are uow being actuslly made, and that still larger guus are in prospect, the time hes come for the abandonment of mannal labor and the substitntion of an insnimate and unlimited power like that of ateam, acting either directly or through the medium of water nnder pressure. Tue heat and elasticity of steem, and the difficnlty of couveying it from place to place, render it unsuitabla for direct application to the working of guns; but in the hydraulic system so anccessfully and so variously developed by Sir William Armstong for commercisl purposes, steam is made available as a central source of power by employing a steam-engine to pump water into pipes which transmit it at high pressure to the various points of application of the force where it acts in hydraulic presses to produce the different movements required. The power derived from the steam-engine is thus tranamitted with great ease to numerous and distant points, where it is turned on or off with mnch the same facility as a jet of gas.—*Iron.*

WHITWORTH STEEL.—Some idea of the solidity of compressed castinge of Whitworth metal may be gleaned from the fact that, five minutes after the application of pressure—about twenty tons to the square inch—a column of fluid steel becomes shorter by 12.5 per cent., or 1¼ inches to the foot. Sir Joseph Whitworth, as a writer in *Iron* states, holds the proportion that for certain pnrposes a metal must be used haviug a certain tensile strength and a certain percentage of ductility. Heuce the metal cast at the Whitworth works is classified according to its possession of these qualities, and arranged for convenience in four groups, distinguished by colors, red, blue, browu and yellow, and by numbers, No. 1 of each grond represeuting the most ductile metal, and No. 3 the least so. Various samples of Whitworth steel tested gave from 36 to 72 tons tensile strength, and from 33.3 to 14 per cent. elongation. There is shown a singular relation between the tenaile strength and ductility of the metsl, the oue generally increasing as the other decreases, a circumstance which, it is suggested, may possibly deserve investigation.

THE POLYSPHERIC SHIP.—Thia is the name of a novel vessel, recently invented in England by Mr. Charlea M. Barnes. The bottom ie flat and fitted with three inclined planes with square ende, the effect being aa though three teeth of a gigantic saw were moved through the water with the sloping portiou of the teeth first. The iuventor has tested the device by meens of amall modele impelled by rockets. A seven pound model was driven, by a three pound three ounce rocket, a dietance of 105 yarde in three seconds, or at the rate of 63 knote per hour. The motion ie said to resemble eliding over ice. There is scarcely any water dieturbance, and the decks were apparently motionlesa. Wheu drawn slowly over the water, the vessels offered more resistauce than models of the ordinary shape; bnt when the equilibrium, between the horizontal preaeure of the inclinee forward and the pressnre of the water in the contrary direction, ia destroyed, the model at once rises in the water and passes over the mass of hitherto obstructing fluid.

LONG SERVICE OF CAR WHEELS.—The Port Jervis (N. Y.) *Gazette* of recent date saye: At the Erie car shop in this place a record is kept of the wheels removed from cars. To-day four wheele were removed from a freight car which were made, respectively, in the following years: December 24th, 1853, two November 30th, 1853, May 31st, 1854. These wheele have been running over 20 yeare, have doubtlese worn out several care, and are fit atill, apparently, for aa mnch more wear. Allowing 20 daye in each year for etanding still, and 10 miles an hour while running, they have run 1,697,400 miles.

The Stevens Battery.

This famous war vessel, which has grown venerable without yet heing weaned, is said by a Jersey City paper to have cost some $2,000,000, and her completion will probably cost another half million. Her length ia 400 feet on the deck, or 300 feet at the water line. The breadth of beam is 45 feet at the hnll proper, and 54 feet above the armor plating. The depth of bold is 24½ feet from deck to keel. The inteution is that the vessel shall draw 22 feet of water. Her total weight when in sea-going trim will be abont 6,000 tons. She has eight boilers, and will burn eight tons of coal per hour. She has four engines, arranged in pairs, each pair driving one screw. The eteam cylinders are six feet in diameter, with a pieton-stroke of three feet nine inches. Her average speed will he from 14½ to 16½ knots per hour. The screws are of the twin pattern, 18 feet in diameter, with a pitch of 27 feet. The weight of the engines and boilers, taken together, will be about 1,000 tons. The side armor of the ship is ten inches thick, and her turrets will be one and a half feet. Her guns will weigh 100 tons each. She is built in seven water-tight compartments, with a donble hull, and with bows cellular in strnctnre. They are in fact so constructed that 35 feet of them might be carried awsy without any material injnry to the vessel. It has been eatimated that, acting as a ram, the Stevens battery would strike a blow of sufficient force to raise a vessel of her own siza ten feet in the air. According to these calculatious, the force of the blow would be equal to that of aix shots from the heaviest gnns known, fired simnltaneonsly on the same apot.

ANOTHER INCENTIVE TO HONESTY.—An electrical recorder has been invented in England which is nsed to record tha number of passengers in an omnibus or atreet car. This ingenious instrnment is fixed in some oonvenient part of the vehicle; all the seats are in conuection therewith, and every paasenger by sitting down makes contact and records his presence. The record is a strip of paper on which four pens make a series of lines and marks. The first line connts the minntes spent on the jonrney; the second line marka the speed and the stoppages; the third line counts the number of iuside psssengers within each miunte of the time line, and the fonrth line doea the same for the ontside passengera. All thie goes on, so to speak, of itself; the passengers are unconscious of it; the conductor cauuot hinder it, and ao at the eud of each journey the inspector tesrs off the strip of paper, and finds thereon an exaot account of the number of fares he ought to receive. The applications of this instrument are obviously manifold, bnt in the msnner described it is likely to be of most utility and snpersede all other contrivances for the purpose.

A NEW SUBMARINE VESSEL.—A French indnstrial journsl describes a submarine vessel which was invented in Psris during the siege, but not then brought into use. It is oblong in shape, both ends being cylinders in which pistons cau be moved ont and in, thus vsrying the volnme of air, and making the vessel rise and sink ss may be desired. To prevent the sea water interfering with the action of the pistons, the iuternal surface of the cylinder is protected by an arrangement like the bellows of an accordeon. The vessel hes glass windows at different parts, and tools of various kinds can be protruded through caontchono sheaths which preveut entrance of water. There are two screws, one vertical, the other horizontal, driveu by compressed air, or by the hand; the latter being used in case of a slight vertical or longitudidal inclination. There is, in addition, puenmatic apparatus for expulsion of vitiated, and supply of fresh air. This machine hss made a very favorable impression on engiueers and others competent to form an opinion of its merits.

A KNOWING ENGINE.—The Corliss pnmping engine for the Providence water worke is a marvel of automatic self-regulation. The problem of dispeusing with a eecoud reservoir or etand-pipe for high service, the Corliss Co. has solved by the construction of a uniqne "tahle engine," capable of pumping 5,000,000 gallone of water per diem, or more, if needed. That is to say, if every outlot from the supply pipes distributed over the high aervice of the city were closed so entirely that uo water whatever escaped, the pumping apparatns remains perfectly at rest, but the instaut any appreciahle outflow occurs, the machinery, with no human eye interveuing, proceeds to supply the waste. It hae been kuown to be over five and a half miuutes in making a aingle revolution, moving regularly all thie time, however, and capable of increasing thie rate almost immediately to more than 30 revolutions a minute—and all that of its own accord.

THE ingenuity of the French is ehown in the mechanical ainging birde of M. Bontems and the marvelloue watches of M. Haae. Some of these watches wind up by the mere process of opening and shutting the onter case. One watch givee the day of the week and the date, besides the phases of the moon, striking the honrs and quarters, and marking time to the aixth of a aecoud. Another watch strikes hours, quarters aud miuutes.

A FRENCH inventor hae constructed a petroleum lamp with ten emall wicks instead of one large one. Theae are arranged in a circle, and attached to a frame movable by a aingle rack.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

Mining Stocks.

Mining stocks generslly are much higher tbsn reported last week. The msrket rose steadily until Tuesday morning, when higbest prices were realized. Discoursging reports from Imperisl-Empire somewbat weakened the market, snd in tbe afternoon quotations fell considerably. Siuce tbeu stocks have recovered their tone, althongh figures are not quite as high as at the beginning of the week. Seg. Belcher, Chollar and Exchequer led the msrket. Crown Point and Belcher are held less firmly. Reports from nearly all the different mines on the line of the Comstock are more favorsble than they have been for a long while. Strikes are reported in a numher of the mines, and work is being prosecuted vigorously, as the number of the newsssessments would indicate.

The Pioche stocks were generally weak, witb the exception of Pioche, which moved slightly. There has been much speculation in Belmout. California stocks are still very dull.

As far as the condition of affairs in the Comstock is concerned the following from the *Enterprise* is of interest: That we are to hsve a rise in stocks at no very distant day seems very probahle, as not a few very important developments have been made of late snd others seem to be on the eve of heing made. The situation along the whole line of the lead is most promising, and in several mines the indications sre snch tbat we should not be surprised to hear almost any day of very rich snd important developments beiug made. The ore bodies discovered in the Ophir snd Empire mines have not only held their own, but are dsily improving in richness aud expsnding in size, showing that there exist in these mines permsnent deposits of psying ores. The greatest sctivity prevails amoug our prospecting compsnies and all are firmly of the opinion that sooner or later they will meet with tbe reward of their perseversnce, as the Ophir and Empire companies have done. The Gold Hill *News* says of the strike in the Woodville: The recent rich ore strike in the Woodville is significant and important, not only from its beiug so much richer thsn any beretofore found in tbe mine, but from its peculiar character, it being black sulphuret silver ore in white quartz, very much resemhling the rich ore of the Crown Point or Belcher. Such ore found in that part of Gold cañou is highly encoursging to the other well known and valuahle mines in that vicinity.

On account of the extreme hest in the mines of the Comstock, the men are supplied with ice-water, the consumption of which is enormous, the Belcher miue using 6,500 pounds of ice daily, the Consolidated Virginia 7,000 and other mines in proportion.

In the vicinity of Hamiltou, Park county, Colorado, placer miniug is heing carried on successfully and profitsbly, aud withiu a year or two it is probable that mining! affairs will he as aotive as they were in 1861.

New Incorporations.

The following compsnies have filed certificates of incorporation in the County Clerk's Office, Ssn Francisco:

Alameda Coal Mining Co.—August 28. Location: Alameda and Contra Costa counties. Directors: H. P. Coon, C. H. Burton, C. C. Webb, J. S. Hntchinson and E. B. Perrin. Capital stock, $500,000.

Booth Gold Mining Co.—Aug. 28. Location: Orleans mine, near Auburn, Placer county. Directors: D. A. Booth, G. A. Miller, E. B. Dorsey, Richard Chenery and Robert M. Graves. Capital stock, $4,000,000.

Star Mining Co.—Aug. 28. Location: Cherry creek mining district, White Pine county, Nevada. Directors: E. R. Burke, Charles E. Elliott, Lewis Goodwin, C. W. Heeney and J. D. Fry. Capital stock, $3,000.

The Gray Planet Mining Co.—Aug. 3. Location: Mariposa county, Cal. Directors: A. S. Peterson, J. W. Tripp, D. Friedenrich, E. S. Brown and T. Mayer. Capital stock, $1,000,000, in 20,000 shares.

Ellmore Hill Hydraulic Mining Co.—Sept. 2. Location: Placer county. Directors: S. Hemenway, Robt. Sherwood, George D. Roberts, William Sherman and B. B. Minor. Capital stock, $6,000,000.

Hemlock silver mining company, Surprise Valley mill and water compmy, Wyoming silver mining company, Little Chief silver mining comnany, Stewart's Wonder silver mining company and Challenge silver mining company were incorporated on the 2d inst. The purpose for which these corporations are formed is to do general mining business in Panamint mining district, Inyo county. Directors: A. Pritchard, J. D. Fry, B. Peart, Henry A. Jones and Samuel A. Raymond. The capital stock ranges from $1,000,000 to $6,000,000.

The following named companies have filed certificates of incorporation in the office of the Secretary of State at Sacramento:

San Lorenzo Flume and Transportation Co.—Aug. 26. Object: To construct and operate a flume from the headwaters of the San Lorenzo creek to the ocean beach, at or near Santa Cruz, for the transportation of lumber, etc. Place of business, San Jose. Directors: John H. Dibble, E. J. Cox, Chas. Silent, W. J. Colahan, Jas. H. Morgan, David Williams and C. J. Harrison, all of Santa Clara county. Capital stock, $500,000, in 5,000 shares.

Golden Sulphuret Mining Co.—Aug. 26. Location: Sonora, Tuolumne county. Directors: D. M. Kenfield, Jos. Bray, Wm. D. Davies, John Barry and Martin C. Ducbow. Capital stock, $450,000 in shares of $100 each.

Meetings and Elections.

Senator Silver Mining Co.—August 26. Trustees: J. E. de la Montagnie, Robert Sherwood, W. F. Myers, J. C. Hanscom and Seth Pinkbam. At a subsequent meeting of the Trustees J. E. De la Montagnie was re-elected President and Henry Boyle, Secretary.

Meadow Valley Mining Co.—Aug. 27. Trustees: Robert F. Morrow, Augustus J. Bowie, Jr., J. D. Fry, J. H. Dobinson, George W. Beaver, Richard Wegener, Oliver Eldridge; President, George W. Beaver; Vice-President, J. D. Fry; General Superintendent, D. M. Tyrrell; Secretary, T. W. Colburn; banking house, the Bank of California; Company's Counsel, Harry I. Thornton, Pioche, Nevada, and San Francisco, California. During the year, 5,224¾ tons of ore bsve been extracted from the mine. The total receipts of tbe company for the year amounted to $900,171.66.

Stickeen.—About $150,000 came down to Victoria from the Stickesn mines last week, so they must be doing some work there in spite of ths cold westber. Mining on Deass creek is csrried on vigorously; tbe mines, so fsr, on whioh dsms bave bssn erected, are yielding very handsome results. The Three to One company returns from thres to four ounces a day to each man. The present estimats of the mining population of Casslar is generally thought to be about 1,000 men, and to supply the wants of tbis number in provisions, tools, nails, and other necessaries, as well as the luxuries, such as liquors, etc., there are only 190 psck animals to convey such goods from the head of navigstion on the Stickeen river to the sest of the mining operations—a distsnce of about 90 miles.

Arizona Mining.—The *Miner* feels jubilant over the mining prospects of tbe Territory, and says: We might iudulge in gushing language sbout the immeuss numhsr of rich mines of gold, silver and copper, scattered all over Arizons; but think it best, st this late dsy, to let our yield of tbe precious metals speak for the Territory snd its mines, in which connection all thst is necessary for us to stste is that tbe little work now heing done, is setting free onnce after ounce of gold and silver, which go to San Francisco, New York and elsewhere, will have a telling effect upon the doubters who profess to believe thst Arizons is a worthless region, fit only for thieving Indisns snd Indian sgents.

The Busro-Burro Mines.—Nearly a year ago L. L. Tresdwell ohtsined the indictment of George D. Roberts ou a charge of misdemeanor, alleging that in 1870, Roberts, hy false represeutstions, induced him to purchsse a heavy interest in the Burro-Burro mine in New Mexico, owned by Roberts, thus defrsuding him of $50,000. The case has been repeatedly continued at the request of Mr. Tresdwell, on tbe ground thst he could not procure the atteudance of his witueses. The case came to trial this week, however, and the judge disposed of the whole matter hy directing the jury to return a verdict for the defendant, which they did, and the verdict wss so recorded.

The new pump of the Sierra Nevada company bas beeu started up and is running successfully. The first 50 strokes, says the *Enterprise*, on a five-foot stroke, brought the water up to the drain tunnel—a distance of 265 feet. Thns it will be seen, that, although the stroke was but five feet, tbe water was raised more than that distsnce at each stroke—tbe gain in 50 strokes being 15 feet—showing that from the very start perfection wss achieved.

The furnaoe of the Tyho Consolidated company is now in successful operstion. The company intends to commence the shipment of bullion. As soon as the furnsce has heeu thoroughly tested two more will be erected by the same company.

The smelting operations at tbe Mattison furnaces sre likely to prove a success.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALAMEDA COUNTY.

LIVERMORE COAL MINE.—Cor. *Enterprise*, Aug. 29: We have samples of coal that will compare favorably with any found on the coast, from a depth of 140 ft. The main ledge or bed has not yet been struck, but under the management of the present superintendent we expect to reach it in a short distance further. The timbering of the main shaft is made with the heaviest pine, and the other necessary material used is of the best class. About the last of September the company will ship a cargo of this coal to market on trial. It now has the general appearance of the Cumberland coal, and from local tests it is equally as good.

ALPINE COUNTY.

BETTER TIMES.—*Chronicle*, Aug. 29: A much better feeling regarding the future of our county now exists among our people, particularly among those interested in mining operations, consequent on the successful working of the Silver Glance ores by McGlew's process—the Eagle roasting furnace, now in successful operation at the M. & N. W. mill. Our ores, as a general thing, are very rich and rebellious, and until the introduction of the McGlew furnace the attempts made to reduce them have proved unsatisfactory. These failures have had a depressing influence on the general business of the county, but the success of this new process has caused a decided change in our feelings, and we look for better times as our treasure hills give forth their wealth.

SILVER GLANCE.—This mine never looked so well as now, ore having this week been taken from the bottom of the shaft that will average $150 per ton, and assayed $200 and upwards. The ledge is three feet wide and widening.

AMADOR COUNTY.

BUTTE CITY.—Cor. *Ledger*, Aug. 29: The Butte Mountain gravel claim, at Butte City, has a tunnel 225 ft. in length, fully penetrating the rim, and now the sinking of a shaft closely adjoining the bedrock, which is nearly perpendicular, in order to fathom the basin, is under fair headway, and has at the present reached the depth of 32 ft. The substance through which the shaft is being sunk is a very hard cement, and blasting is the only available means by which the work can be accomplished, hence the shaft attains depth slowly.

CALAVERAS COUNTY.

WEST POINT DISTRICT.—Sinking has commenced at the Mina Rica. In probably 20 feet deeper the shaft will be inclined with the vein which will facilitate progress. Recent developments in the Zacatero are quite gratifying. Three bodies of first-class ore are now being opened; their extent is so far unknown, but a larger quantity of fine ore has been already uncovered than previous workings indicated. The mill is steadily running on better ore than ever taken out of the mine. An unassorted lot of ore from the new discovery of Brigge & Co. paid at the rate of $60 per ton. A large body of ore has been discovered in the mine of McNoughton & Co., near Licking Fork. The vein is 6 ft. thick, estimated to average $10 per ton. A force of men are at work in the Lone Star. To judge by the returns from custom mills the yield of ore apparently increases, on the average, as the mines reach lower depths.

GWIN MINE.—Everything is progressing favorably. The mills are kept going without cessation and developments in the mine are eminently satisfactory. The ledge has been struck in the 900-foot level at a distance of 135 ft. from the shaft. That is fully 100 ft. less than it was found necessary to run in some of the upper levels, and is a most encouraging assurance that the pay chute increases in extent as a greater depth is reached. The rock, where first uncovered in the level, is low grade, but the ledge is wide and the character of the ore is improving as work progresses.

KRIM & Co., the well known Moaqnito gulch quartz miners, had a lot of rock crushed in Garland's mill lately, that yielded an average of $15 per ton.

COLUSA COUNTY.

QUICKSILVER.—*Sun*, Aug. 29: On Tuesday last the Abbott mining company commenced to lay brick on their new furnace, and it will be completed in about four weeks. As soon as Mr. Dowling, the superintendent of the work on the Abbott furnace, gets through with it he will commence one on the Buckeye so that in about two months each of these mines will have a furnace in full blast. On Sunday last the Elgin company ran out with a retort 57 pounds of quicksilver from 355 pounds of ore—the first run from a new tunnel.

DEL NORTE COUNTY.

BLACK SAND.—*Courier*, Aug. 29: The party who are connected with the mining enterprise at Stone Lagoon have abandoned the plan of pumping up sand from the bottom of the lake, as that on the shore is rich enough for working, and there is a large body of it. Henry Orman, at the Lower Gold Bluffs, is putting through immense quantities of very rich sand at that claim. Willis Pinnell, who came up this week, says that much of the sand was not black, but absolutely yellow with the auriferous metal.

EL DORADO COUNTY.

ANOTHER MINE TO BE OPENED.—*Republican*, Aug. 29: Capt. Woodworth has bonded the Young Harmon mine, and is now busily engaged in putting up a steam mill and hoisting works on the same.

THERE is a force of about 1,200 men now engaged at work on the El Dorado Water Co.'s canal, several miles of which has already been completed, and much of it is in an advanced state. The canal is four feet deep, four feet wide on the bottom, and 12 feet across the top. The work is being done in a thorough manner, and really looks too nice to be used to run water through.

NORTH-SIDE MINES.—Cor. *Mountain Democrat*, Aug. 29: The Sliger is now in fine condition for working, a tunnel having been run in to the ledge, which drains the water from the mine and they are extracting some of the best ore I ever saw. The Cederberg have their new hoisting works in place and working well, and the mine is in fine condition for profitable operations. The Taylor mine is in charge of W. T. Gibbe. I went down to the 400 ft. station, where I found a ledge nine feet in thickness at the station, and in the south drift on that level, 45 feet from the station, the ledge is fully six feet thick, showing high grade ore. The north drift on the same level is in 70 feet, with a large and well defined ledge, liberally flecked with free gold sticking out of the solid rock. It has never been my fortune to see a mine which excels this in richness of ore, of which there is enough in sight to run a 20-stamp mill for at least two years, the levels having been run a distance of 115 ft. from the 400-ft. station, with a ledge averaging fully six feet in thickness and every prospect of continuing as large for hundreds of feet further. The Rosekrane mine is at present lying idle. The Julia lies one mile south of the Rosekrans, on the road to Garden valley. Here I found a force working on a new discovery, supposed to be on the same ledge as the Taylor. Here a shaft has been run to a depth of 23 ft., the ledge having increased at that depth from 10 inches on the surface to four ft. at the bottom of the shaft. The gold is fine, but is generally diffused throughout the rock. The Mansfield mine is located between Garden Valley and the St. Lawrence. There are two ledges, both opened by a tunnel, and the whole appears to be in splendid condition for working. A large proportion of the rock is partially decomposed and shows gold plentifully by pan prospect. The St. Lawrence was not in operation, the ledge having been lost at the 800-ft. level, but it was struck again in running the north drift, and cut into to a depth of about 18 inches, the ore showing gold freely.

INYO COUNTY.

BENTON.—Cor. *Independent*, Aug. 29: Albert Mack has shut down his mill for the present, but intends to start up soon, either on a quality of ore that requires roasting, or on free ore if it can be obtained at his mine. Mr. Wetherill's mine in Hutch's cañon is looking better than it ever has, and considering his facilities for milling (a four-stamp mill), he is doing a splendid business. He runs out between $1,000 and $1,200 every 24 hours. Other mines in this vicinity are looking up, and prospectors are almost daily bringing in good specimens from new discoveries, principally in Hutch's cañon and Yellow Jacket districts.

PIUTE DISTRICT.—The Golden Era is a 20-ft. ledge of free gold, cropping out for a length of 1,500 ft. The Golden Chariot is 8 ft. wide, free gold, the ore ranging from $50 to $300 per ton; has a water power sufficient for 20 stamps. The Sage Hen is a 4-ft. ledge of free gold. The silver ledges are: The Belle Stanley, 20 ft. wide, assaying from $55 to $200 per ton. The Stonewall Jackson is another 4-ft. ledge, very rich, assaying from $600 to $800 per ton. The Juniata is a little larger, average assays giving $69 in silver and $18 in gold. The Susquehanna is another 20-ft. ledge, running from $25 to $200. William Penn, 3 ft. wide, assaying from $300 to $500. The Babe, quite a large ledge, assays still better, running from $250 to $1,000, as also does the Columbia. The new arrastra is running constantly, and is doing well on free gold ore.

LOS ANGELES COUNTY.

OIL.—*Herald*, Aug. 23: Our oil companies are at work with commendable zeal. They are boring on one claim, and are down nearly 200 ft., with a prospect of a flowing well at a depth of 300 ft. The oil has been tested, and all of it can be made into the best quality of illuminating fluid, and some of it is very good lubricating oil in its crude state. Carreras and Childs have just returned from Lyon's station, and they have determined to use the present refining buildioge to refine oil on the Carreras process, as it can be changed at a very small loss to the company. That there is a very large supply of petroleum in the San Fernando district is known to all oil experts who have seen and examined.

MENDOCINO COUNTY.

MORE MINES.—*Democrat*, Aug. 29: Jess Dodson, recently over from Point Arena, tells us there's much excitement thereabout because of recent discoveries of silver and gold on the ranch of William Shoemake, near Manchester, and also on that of George Davis. Some ore has been sent to San Francisco and assayed, and it is reported as yielding a value of from as low as $10 up to as high as $470 to the ton. We hear of another strike of silver but a short distance from Ukiah, in which Wertenberg and the Burgere are interested. They report a big showing, and have set to work to tunnel and prospect.

MONTEREY COUNTY.

LIME.—Cor. San José *Mercury*, Aug. 31: There is an abundance of lime, rich in in quality, and similar to that at Santa Cruz, on the Gabilan range of mountains, 18 miles from Salinas city, Messrs Brand & Barbour—Brand of Salinas city, and Barbour of San José—burn lime there. There are two lime-kilns, called the upper and the lower, and 1,400 barrels are burned an shipped per month, the demand always being greater than the supply, which they hope soon to remedy. The price usually paid for the lime is $2.50 per barrel.

QUICKSILVER.—Stayton & Co.'s mine, about 18 miles from Hollister, is turning out splendidly,

NAPA COUNTY.

ARGENTIFEROUS.—A party prospecting in the hills and mountains around Popa valley report the discovery of a well-defined ledge of rich silver-bearing ore in that neighborhood. In view of the silver developments on Mt. St. Helena, only a few miles distant on the same range of mountains, it is not improbable that an extension of the quartz lead of the Calistoga gold and silver mining company has been struck.

STEAM UP.—On Saturday last steam was gotten up for the first time in the mill of the Calistoga silver mining company. Quartz crushing will not commence for several days. In the meantime a constant stream of visitors is attracted to the mine.

NEVADA COUNTY.

THE OMAHA.—*Tidings*, Aug. 24: The Omaha mine is improving as work progresses. A run of 24 loads made this week through the Larrimer mill gave a return of about $28 per load.

GOOD BELOW.—The Idaho shaft, now going down for its 900-ft. level, is encountering splendid ore; as good or better than at any point above. Truly, the Idaho, with its five or six years' supply of good milling ore in sight, and more coming, may be said to be a great mine.

NORTH STAR.—It is said that the Superintendent has orders to shut down the works, and that the machinery is being taken out of the lower levels, as fast as they can be pumped out for that purpose.

REES' mine, out at Randolph Hill, is developing finely. Ten men are working two shifts, and the new shaft or inclined is down fifty feet. They have to contend with considerable water, but are realizing much good pay grit, several thousand dollars' worth lying on the dump, taken out in sinking. The ledge becomes firmer and less decomposed as depth is attained.

EUREKA.—Last week's run of ten stamps produced 500 ounces of amalgam, worth about $4,000. The ground in the bottom of the shaft not only continues favorable for sinking, but is said by the workmen to present encouraging symptoms of good pay in the ledge. We learn also that promising rock is found in new ground owned by the company, west of the original location.

GRAVEL.—On the Omega ridge, the largest enterprise at work now in the Omega company, and from all reports they will make the grandest clean-up this season they ever made, though it is said they took out $70,000 two years ago. There are several very valuable gravel mines on this ridge. The one next best known is the Blue Tent mine, five miles above Nevada City. An English company now own this property, and they seem to have the energy and enterprise necessary to its proper development.

STRIKE. — *Transcript*, Aug. 29: We learn that parties have struck an undeveloped ledge on Deer creek, that yields, by mill process, $75 to the ton. The rock was taken out of a shaft.

LOWELL HILL.—*Transcript*, Sept. 1: Times are very lively about here. Every one is busy, and there are no idlers. The mines are all running, and the pay is good. They are getting in their winter's wood and timbers for use in the mines.

NORTH BLOOMFIELD. —*Union*, Aug. 30: This company is pushing forward its immense works with all energy. About 1,000 men are busy at work on the company's ditch. The ditch will convey water from Jackson's ranch, by Bloomfield, all the way down to French Corral. The tunnel, through which the gravel belonging to the company is to be worked, will be completed and in use by the first of December next.

PLACER COUNTY.

Some coal is said to have been found near Auburn, and in close proximity with the noted iron mountain, which only needs cheap fuel to make it profitable. The vein is not found yet, but the float coal is said to be good, and the deposit it is hoped will soon be traced up.

SIERRA COUNTY.

MINING ITEMS—*Mountain Messenger*, Aug. 29: Lorenz Neesler & Co., have tapped the ledge in their tunnel above the Keystone mine. The rock shows well in gold. It is reported that a body of rich ore has been struck on the west drift in the Keystone mine. The Oak ranch mining company are putting in a lot of pipe for the purpose of supplying the workmen in their tunnel with pure air. Good pay has been struck in Boardwell tunnel at Laporte.

EAST FORK.—Ernst Kruse, superintendent and principal owner in the East Fork quartz mine, has decided to erect a large arastra on his claim. He has out in the neighborhood of 200 tons of good rock.

MAJOR WM. DOWNIE has sent us a splendid specimen of silver and copper ore, taken from a ledge within eighteen miles of Downieville.

A COMPANY has been organized for the purpose of prospecting for a gravel bed at Red Dog, a mile and a half northwest of Downieville.

SISKIYOU COUNTY.

IRON MINE SOLD.—*Union*, Aug. 29: Potter has sold his iron mine on McCloud river to an English company for $200,000—the first payment to be made in four months and the balance in eight. It is further stated that the company purchasing intend to commence work on the mine at once, and that before a year there will be a town there larger than Reading.

TRINITY COUNTY.

MINING OPERATIONS. — *Journal*, Aug. 29: From the Cinnabar district, above Trinity Center, we hear that good results are being obtained in the several claims. Mr. Lytle is getting out 100 pounds every day. Other parties are preparing for retorts and expect soon to begin producing quicksilver. The Weaver creek M. M. & F. Co. are getting good pay in the creek at the head of their flume. Last Saturday they took out $750 for that one day's work. All the miners in the Weaver basin are done cleaning up, except Mr. I Woodbury, and he will finish in a few days. The Weaverville D. & H. M. Co. has completed the reservoir, and now everything is in splendid condition for winter, until which time nothing can be done.

GOLD IN THE STREET.—Cleary and Hanlon scraped the surface from the street, in front of Griffin's banking house, and rocked out about an ounce and a half of gold dust, Thursday afternoon.

GOOD PAY.—In running a drain from the cellar under Lang's store, last week, four wheel-barrows of dirt, off the bedrock, were washed in a rocker, and yielded twelve dollars

TULARE COUNTY.

MINERAL KING.—*Times*, Aug. 29: We were shown some specimens this week from a new discovery made by Meadows & Co., in Mineral King district, which are entirely different from anything yet discovered. It is a brittle, dark looking ore. There has been no assay yet made, but experienced miners think it to be very rich in silver. The lode is 14 ft. thick of solid ore. Mr. Meadows also informs us that they have sunk down several ft. on the Maginnis lode, and find the ore to be 6 ft. thick, and assays show $89 of silver to the ton, a marked improvement on the first discovery.

TUOLUMNE COUNTY.

A RICH CLAIM.—*Independent*, Aug. 29: Anthony Lovell, of French Gulch, west of Columbia, has struck the old Fox gravel lead on his land recently patented. It pays him with light work at the rate of $6 per day; and when worked with energy and system, as he is now making preparations to do it, will pay twice as much to the man. Lovell has only to strip 9 ft. to find the gravel, which has already developed into a large deposit. The lead was lost here in early days, being extensively worked a few hundred yards further south by means of shafts and drifts.

Nevada.

WASHOE DISTRICT.

BELCHER.—Gold Hill *News*, Aug. 27: Daily yield, 550 tons. The mine is looking splendidly throughout. The ore breaste on the 1,300, 1,200 and 1,000-ft. levels are all yielding richly, and there is a decided increase in the percentage of gold in the ore extracted, largely increasing the returns from the mill. At the present rate of yield the proceeds of the mine for the present month will amount to nearly, if not quite, $1,000,000. The mills are all running up to their full crushing capacity, and everything is looking flattering for a good fall run.

SIERRA NEVADA.—The new machinery is all working with the utmost perfection, and when the pumps are once in full working condition everything will be in complete readiness for the prosecution of a series of prospecting operations, such as has never yet been undertaken on that portion of the Comstock. Daily yield, 60 tons of ore, keeping the mill steadily running.

CONSOLIDATED VIRGINIA.—A constantly improving appearance is noticed in the ore stopes on the 1,300 and 1,400-ft. levels. Daily yield 300 tons of ore. Work on the new mill is making steady and favorable progress.

HALE & NORCROSS.—The depth of the main incline below the 2,000-ft. level is now 95 feet. The timbering completed to that point. The daily yield of ore is 80 tons.

CROWN POINT.—Daily yield, 500 tons. The ore breasts throughout the entire mine are looking well and yielding finely. The mills are all running up to their full capacity, and the prospects are very favorable for the payment of the usual monthly dividend the first of next month.

WOONVILLE.—The ore development in the north drift on the 200-ft. level still continues to not only hold out, but shows a steady improvement in the quality of the ore.

SUTRO TUNNEL.—At present four Burleigh drills are in operation in the header. Progress for the last week, 68 feet, with a delay of sixteen hours, owing to the leakage of the tank supplying the water for drilling purposes.

OPHIR.—The north winze from cross-cut No. 2, on the 1,300-ft. level, is in fine ore, which has shown a steady improvement in the quality for the past four days, average assays running as high as $400 per ton. The ore in the south up-raise on the 1,465-ft. level, is of a very rich quality The new raise in the east drift on the 1,465-ft. level, has also struck splendid ore. Both the north and south ore stopes on this level have opened into exceedingly rich sulphuret ore, in much of which the free gold is plainly visible. These bodies of ore are not only rich, but promise a wide extent. The

[Continued on Page 156].

Steam Engines on Exhibition.

There are fifteen steam engines shown iu the Pavilion, varying in cepecity from a mere toy or model, which might be placed on a ledy's work-etand, to those of thirty-horse power. Each of theee engines ie of a representetive character, presenting points of novelty and interest which might be made the subject of special and instrnctive mention. Each has been constructed for some special cless of work, and hence differs essentielly from ell the others. To commence with the peir of right and left hand engines which are employed to drive the chief portion of the machinery at the Pavilion, we heve here two machines which preeent the latest advance steps in the production of steam engines, combining simplicity of construction, economic results, fewness of pieces eud ready accessibility for the engineer to all parts of the engine. These engines are exhibited by the Union Iron Works, and are of twelve inches hore, with twenty-fonr-inch stroke. We have alreedy made quite full mention of these in our issue of August 29:h, to which we refer for further particulars in thie connection.

Another pair of fixed engines of good workmanship, aud simple and economical arrangement, for the specialty for which they are designed, may be seeu a short distance to the right of the ones just described. These engines are placed upon a broad, heavy bed-plate with their cylinders at a slight inclination, in order to do their work most directly and with greetest economy of spece. They are simple in construction, plain and substantiel, as they should be for the work for which they ere intended—hoieting from mines. These engines are exhibited more eepecially for the purpose of showing a very important improvement in connection with hoisting epperatus, known es "Eppelsheimer's compound clutch gear." This gear worke with a double bend, and is arranged so that if it is desired to hoist, the engineer hes merely to deprese or bear upon the lever, while to lower he has nothing more to do thau to eese up. The device is exceedingly simple, end under the most ready command of the engineer. It mey be eeen in actual operation, hoisting a heavy weight, which is swung upon the outside of the Pavilion. Theee engines, as a matter of oonvenience as well es curiosity, are worked by compressed air, taken from the compressed air reservoir connected with the Burleigh drill. The engines are each seven-inch cylinders and about six-horsepower. The device is a Califoruia invention aud quite a novelty in its way. They were mede at the Risdou Iron Works.

In the immediate vicinity of these hoisting engines may be seen an engine working the air pumps connected with the Burleigh drill. A steam engine, like a human being, requires a large amount of air for inhelation, while it sends forth a nearly correspondiug emount of vitiated air, uufit to sustein either life or combustion. Hence the difficulty of operating such an engine in a mine or tunnel. In order to meet this difficulty the engine ie often employed, ae in this instance, to compress air, which, when compressed, is simply the pent up force representing the heat which hes been applied to the hoiler, end which may now be conveyed iu tubes for any reasonable distance, to the point where it is needed for expenditure in work. Of this we shall speak more fully when we come to describe the operation of the drill. We allude to the fact at thie time merely to instance the fecility with which the steem engine mey be employed to do indirectly, whet it cannot conveniently be mede to perform directly.

Passing on toward the Merket etreet end of the Pavilion we come to two "donkey engines," as they are celled, exhibited by Messrs. Hawkins & Centrell, 210 Beele street. Two sizes are shown, the smaller of which wes the engine employed during the first days of the exhibition for runniug the power press upon which the MECHANICS' FAIR DAILY is printed. These gentlemen make a specialty of building this class of portable engines, which are lsrgely nsed for various purposes in all parts of the State, as they are employed for loading and unloading ships; for pumping and hoisting in the mines, and in general for all purposes for which portable engines mey be employed. They are mede of all sizes end either upright or horizontal. The two on exhibition are upright, and are good specimens of workmanship —subetentiel, but not showy.

Near the further end of the mechinery department our attention is arrested by a heavy hammeriug, which, on examination, proves to be a small steam hemmer, put in operation by an engine exhibited by Treedwell & Co., the well-known Market street firm. This cless of engines, while they are found useful in every locality, are well celculated by their light weight for employment in places difficult of access, es for saw mills, for drilling, for mining work, etc. In this engine the usual heavy iron bed-plate is dispensed with, and a large stick of timber substituted, such as cen reedily he found and prepared upon the ground. The engine is simple in construction, capable of doing heevy work, and but little liable to get out of order—all of which are of great advantege for the purposes uamed. We here see how the steam engine is mede to do our hammering and forging, when required for such work. We shall have occasion to speak more particularly in another connection of this hammer, which we believe is a California invention and mannfacture.

Well Out of the Way.

By verbal order of Lient-Col. Stewart, Cept. Weeden, of the Engineer Corps, made an exsminetion of the ship Petrician, which has been lying on the bar at the entrance of the harbor for some time peet. Having made the requisite exemiuation, Capt. Weeden found that a spar was stending perpendicularly from the wreck, its top being bnt a foot or two under the surface of the water. Also, that a knee from the bow of the wreck protruded ebove the bottom. The remainder of the hnlk has been covered by the sends, so there was very little obstruction to navigation therefrom.. Upon e second examinetion, Capt. Weeden decided to remove the remaining obstructions. He left with the necessary apparatus last week, hut wes compelled to return on acconnt of the high sea then running on the bar. He went again to the wreck, in order to remove the knee and sper with giant powder. To this end he ordered a three-inch rubber hose eight feet long to be filled with No. 1 giant powder. Thie piece of hose conteined twenty-eeven pounds of the powder. He took elso a specially prepared snbmarine fuse, and for the purpose of making sure work, filled several tin tnbes with giant powder.

Mr. Charles Lougee, the well-known diver, hed before examined the wreck and on close examination he found that the spar wes the bowsprit, sixteen inches in diameter at the bottom, which had been broken off and was kept in its erect position by the bob-stay chein. Captain Weeden nnited the two ends of the hoee containing the powder and cut two smell holes in the rubber, in which he inserted the fuse, primed with Giant powder ceps. The holes in the hose were bound np with tar and oiled silk to make it water-tight. Two fuees were nsed so as to prevent a misfire. The circular piece of hose wss then slipped over the spar and the diver, Lougee, pushed it close down to the deck of the ship, whero it was festeued.

The fuse wes lighted, and Capt. Weeden retired to a safe distance with his men. The result of the explosion wes that a large piece of the spar was thrown a hight of forty feet, and on the diver descending it was ascertained that the knee and epar hed been totally demolished, and there wes nothing of the wreck visible above the sandy hottom. Cept. Weeden hes recommended to his snperior officer thst the buoy merking the wreck be now removed, ss the obstacle ie entirely gone. There are some five fathoms of water over the wreck, although the Coest Survey Charts only call for four fethoms.

Rich Silver Ore.

An unexpected and very important change has teken plece in the lowest workings of the Silver Leke mine, situated eoutheast of Daytou, in the direction of Welker River. The vein upon and neer the surfece contained very rich ergentiferous galena. It has been opened by meens of two tnnnels end for some time pest ore has been shipped from it for emelting. The first lot wes shipped to the smelting furnece of an English nompany at Trnckee and was found to pay well; now now they are shipping it to a new furnece at Secramento at the rate of two car loeds per dey. John B. Winters, a principel owner in the mine, yesterdey returned from a visit to it and brings in some specimens of ore just found in the deepest workings from the lower tunnel which show the commencement of a moet importent and wonderful cheuge. Native silver is coming in and is to be seen covering the ore in hright and beautiful sceles. These flakes of silver ere to be seen not only upon the galena hut are also in spots of brown, decomposed meterial resembling iron rust. The galena upon which the flakes of silver appeer is not the bright cubical galena found in the upper portions of the vein, but is a hleck, messive ore in which the distinctive crystallizetion of galene is not contained. It looks more like a fine-greined black sulphuret ore than anything else. The miners (who are only conversant with the gelena ores of this State we presume) are very much astonished at seeing this native silver coming in, end declare that the like wes never before seen. The like may never have been seen in the mines of Nevade, but among the mines of Mexico some of those richest in netive silver produced argentiferous galena on the surfece. From the first we have had a good opinion of this Silver Lake mine, end now we are inclined to believe that there is likely to be made in it some starling discoveries in the wey of native silver; for be it known that they are as yet down but about 200 feet—*Enterprise, Aug.* 26.

WOOD.—Timher is becoming scerce in the vicinity of this city and Grass Valley. Wood hes to be hauled in most oases distances of five miles and over. Still the price is not much higher than ever it wes. Gond wood of different kinde can he purchased from four and a helf to six dollars per cord. Woodmen are busily engaged now hauling to femilies for their winter supply. When the storms come, a good supply of dry wood is a good thing to heve.—*Transcript.*

THE new air shaft of the Belcher will be completed to the 850-foot level in about two weeks. It will be continued to the lowest level of the mine without delay. Being of great size, it will operate ae a chimney to carry to the surface an immense volume of heated air.

The Judd and Crosby Reduction Works.

The *Colorado Miner* saye: The Judd & Crosby works at the upper end of town will be, when completed, probably one of the most conveniently arranged mills in the Territory. It is rapidly being fitted up for work, and before many days the mechanics will give place to the millmen. The building is so situated that advantage can be taken of gravity in the necessary moving of ore, and to systematically explain ite working, let us follow e ton iu its passage through the mill. Entering upon the first or highest floor, which is on a level with the road, the ore is dumped through e trep door into the bin beneath the floor. The team can then pass through the mill to a pletform upon which they can turn.

The hin into which the ore has been dumped opens on the crusher floor about three feet above the level of the stamps. In front of the hin door and hack of the "driet" is the Dodge crusher, to which the ore is fed, and from which it is spread upon the iron plate covering the flue where the ore is dried before passing into the hettery. After being entirely deprived of moisture the contents of the drier fall down to the stamp floor, where they pass through the battery end into a conveyor, when crushed sufficiently fine to pass through a 40 or 50-mesh screen. The stamp capacity of the mill is about 15 tons per day, or a ton to a stemp, there being three betteries of five stamps each. The conveyor carries the "raw pulp" to a floor a little above the level of the top of the furnace, where it falls into a hopper and automatic weigher. From tho weigher the pulp is emptied into a car which cerries it to the hopper, through which it enters the furnace, the mouth of the hopper heing on a level with the lower part of the car.

The furnace is a combiuation reverberatory with Stewart's patent arch. It compriees seven hearths and they ere arranged as follows: The upper or calcining furnace conteins two hearths with a three-inch fall between the two. The last hearth is connected with an inclined flue leading to the middle heerth of the lower reverberetories. On eech side of the last mentioned hearths are two others with a three-inch fall between them also.

The pulp emptied on the first hearth of the upper furnece is gradnelly moved along the npper hearths, and reeching the flue drops down to the lower middle hearth, moving always toward the fire. From the middle hearth the ore is drawn alternately to the right and left on to the chloridizing heerths, where the ore is salted, chloridized and the cherge drawn on to the cooling floor.

From here the "roasted pulp" is conveyed to the pan room, which is ou e still lower level. The pens in use are the combination amalgamators and cepable of holding ebout one and a half tons each, or a total of six tons for the four pans. The amelgam obtained still continuing the downward course goes to the strainer floor and then to the retort room. The retort bullion is then cerried to the melting room, ueerly on the same level as the retort floor, and there cest into ingots, asseyed, merked and shipped.

The peculier edventage of this mill is that except in one ceee everything moves downward, and that is in the carrying of the ore from the battery to the furnace, where an elevator is used. In every case where menual lebor can be dispensed with, either by snbstituting mechanical means or teking advantage of gravity, it ie done.

RICH ORE IN THE OPHIR.—We yesterday morning mede mention of a piece of black snlphuret ore from the 1,465-foot level of the Ophir having been ehown us in which free gold was visible. Yesterday an abundence of such ore was found iu the ore body on the same level. So much free gold hes mede its appearance that a piece of ore two iuches squere cenuot be picked np that does not contain some perticles, end many specimens were teken out thet were literally spangled with gold. Assays taken across the whole face of the ore-body yeterday went at the rete of from $250 to $450 per ton. An assay of one piece of ore was made which showed gold and silver at the rate of $1,400 per ton. In pounding this up in the mortar the greater pert of the gold it conteined was flattened out so thet it would not go through the sieve. Had this been put in the assey, the yield wonld have been at the rate of $5,000 or $6,000 per ton Some yeers ego the finding of a body of ore like this would have heen heralded as a "rich strike," hut nowadays we seldom hear of a "strike," no matter whet may be found. Such a find is now spoken of by mining men as being a "good development."—*Enterprise.*

THE yield from the quartz mines, at least so far as Lewis and Clerk counties, Montaue, ere concerned, is much in edvence of last year, and bids feir to constantly increese. There have been but two or three small mills running in this vicinity, but there have been many hundred tons of ore shipped to New Jersey and Swansea for reduction. This hes given quite an impetus to the Holders of silver mines to develop them, and the coming winter will witness hundreds of men engaged in taking out ores for shipment.—*Helena Independent.*

THE Idaho *World* is informed thet a hunter near the Golden Era miue, on Summit flat, accidentally discovered a quartz vein lately, which was only two inches wide on top, hut very rich in gold. The vein has now been suuk to the depth of about 14 feet, and the rook is literally woven together with threads and wires of gold.

Mining Prospects in Arizona.

For nearly a year the mountains in various directions from Tncon have been scoured by prospectors for gold, silver and copper, and with gradually improved success, until now the developments are abeolutely exciting. It ie not our habit to overrate anything about mining operations; in fect we heve been so ceutious in this respect as to often incur the censure of onr locel patrons. We have always hed feith that work would show wonderfully rich mining property in this section, and the labor and perseverence of our people have verified our faith.

Monday of this week, George Hoeg returned from a proepecting trip in the mounteine about six miles northwest of the noted Oro Blenco mines ebout seventy miles south of Tuscon. He discovered a very rich gold ledge twelve feet in width, in a favorable locelity for wood, water end grass. He prospected both sides end the center of the vein with good prospects at all points. The ledge shows well for a distance of 1,000 yards. He brought in a couple of hundred pounds of ore, the most of which hes been tested by Dr. J. C. Handy, and Mr. Hoeg informs us that every piece teeted exhibited splendid prospecte iu free gold, and it contains some silver. We exemined a veriety of semples of the ore now in Mr. Hoag's office, and they neerly all show gold to the naked eye. There are three veins within the 500 feet claimed in width, all of which contain free gold. This is evidently a most valuable diecovery for the cleimant and this community.

On Tuesday, the most exciting reports were brought from the Young America oopper mine in Silver mountain district, abont 45 miles west of Tucson. Our readers will remember frequent notices of work on thie miue during the past year, aud the pure copper that was found in ebnndance. The workmen are now down 40 feet, et which point the copper has turned into silver, worth from $1 to $3 per pound. The width of the ledge is unknown, as the shaft shows good ore on all sides. Samplee of the ore, es now coming from the sheft, were brought to town on Tnesdey, end may he seen in C. O. Brown's cebinet, at Congress hell. E. A. Pearce sent some to Detroit, Michigan, to E. B. Ward and esecciates, who are taking great interest in Arizona mining property. The Young America mine is the property of Tully, Ochoa & Co.; Charles O. Brown, E. M. Pearce, end probebly others have some interest. Other mines now being developed in the vicinity of the Yonng Americe, are nowlyielding silver ore worth from hundreds to thousends of dollars per ton.

Charles O. Brown and assooiates sterted a wagon load of provisions, tools end quicksilver to the Oro Blenco minee, on Wednesdey, and followed them on Thureday. Mr. Brown has immediate eupervision of the works, end he now goes out hetter than ever prepered to accomplish work. He has no doubt of bringing in 100 ounces of gold in a few days efter he gets out end puts things in motion.

With the large increase of stock end the undoubted brilliant mining prospects in view, the most despondent man ought to look on the future of thie country with essnred hopes of prosperity. Rich mines enough are known to exist and are being operated in a smell way, to ensure, with proper machinery, an annuel product of gold and silver in Pima county of at leest $20,000,000. And prospecting ie going on with increased vigor, and by our own citizens, too.—*Arizona Citizen.*

RAYMONN & ELY.—Yesterday we visited the Raymond & Ely works and found thet preperations were being pushed forword with mnch vigor, for the reception and placing of the pumping mechinery. Fonr gangs of men ere engaged in enlerging the pump shaft, end they are makiug good progress. Three hnndred and fifty feet of the sheft has been enlarged and is newly timbered. The timhering is being executed hy R. P. Audrews, who is a most competent hend at that business. The work of preparing the timbers ie not slight, and keeps four good cerpenters busily engeged in getting them out. Considerable mechanicel skill hes been shown in plenning and building a trues 58 feet in length, intended to support the roof over the engines. It is the work of Mr. Lindsey. The operations are making as rapid progress es possible, consistant with good workmanship, end under the intelligent and careful supervision of Capt. Dey, superintendent, and T. J. Andrews, foremen, will be bronght to a speedy and successful conclusion. From the mine no ore whatever is being raised.—*Record, Aug.* 23*d.*

NOT FALLEN OUT.—We are of the opinion thet the bottoms of our mines have not yet fallen out. The developmenta appear to tend the other wey. A day or two siuce, in the Megnet mine, on the 800-foot level, a large body of ore was encountered thet seems to he as large in quentity es it is remuneretive in quelity. From all appearances it would appear that this deposit is very extensive and effords additionel evidence thet ell that the owners of our mines have to do is to keep at work, end in the end their patience will he rewerded and their outley returned many fold. Abroed there have been a good mauy crocodile tears shed respecting the decedence of the Pioche miues, but ere many months expire we believe we will he able to tell a different tale.—*Pioche Record.*

THE Consolideted Virginia mining company have introduced a new patent three-decker safety cage, made by John A. Holden, head blacksmith at the mine. It is constructed in a strong and substantial manner. Each cage bears the weight of about three and a helf tons.

Useful Information.

New Method of Making Mortar.

So very marked is the mortar used in modern buildings as poor, compared with that long ago used, that various attempts have been made to ascertain the "secret," if secret it was, of the composition of the old builders in mortar-making. One "secret" which the old builders possessed, we may quietly here impart to those of the present day, that is, that to make good mortar, good lime and plenty of it must be used; the old builders did not use a composition nearly all sand, and that sand not fit often to be used, and then call it mortar, as do the builders of the day oftentimes. When we examine almost any piece of modern work, we find that the mortar hardens very slowly, and even when hardened as much as it will harden, it crumbles away, loses cohesiveness, so much so that in many cases it is quite an easy matter to detach the stones or bricks from one another, and from the mortar. The very opposite characteristics are found in ancient work, and on examination it has been seen that the mortar has in great part been converted into silicates, entering into close union with the particles of quartz. It is to these silicates that mortar owes its firmness, and it is to the slowness with which silicates form in modern mortar, and small proportion of these present in it, that this owes its poverty. A method of setting free the silicious earth, and promoting the rapid formation of silicates, has been discovered by a Professor Artus, and which yields a mortar resembling in its characteristics those of the ancient kinds. The great recommendation the process possesses, is its simplicity. Lime is in the first instance well slacked, and mixed carefully with finely sifted sand; to the mass is added a quantity of unslacked lime to the extent of one-fourth of the sand in the first instance mixed with the slacked lime; mix the whole thoroughly, the mass heats and the mortar may be at once used. When the mortar is not wanted for immediate use, the first process only is carried out, namely mixing the sand with the fine slacked lime; when wanted for use the unslacked lime has to be added. A very strong mortar is said to be the result.—*Builder.*

Skeletonizing Leaves.—There are several ways of doing this. That by maceration is long, tedious and disagreeable, and quite out of date. The following are the methods now in use: Lay the green leaves and seed vessels on small sheets of tin, and cover lightly with thin lace or muslin, place in a vessel of cold water, put over the fire and boil slowly for several hours. Uncover one by one, wash out the cellular tissue with a camel's hair brush, then bleach, wire and mount in the usual way. Or put into a basin equal quantities of soft soap and rain water, put in the leaves and let it stand on the stove till the mixture boils. Remove the leaves to a pan of clear, soft water, wash them quickly and carefully from the soap, float out on a piece of glass, and remove the tissue with a brush, rinse in clear water. Or take three ounces of carbonate of soda, one and a half of quicklime previously slaked, and one quart of water. Boil 10 minutes and draw off the clear solution. Return this to the fire, wash the leaves, and boil briskly one hour or till the tissure is easily removed. To bleach the leaves, mix a drachm of chlorate of lime with a pint of water and a little acetic acid or strong vinegar. Steep the leaves in this about 10 minutes, simmer, rinse well and place in books to press. Or procure Labarrague's solution of chloride of soda, and use a teaspoonful to a quart of water. Put the leaves in, and in two or three days they will be perfectly white. —*N. Y. Tribune.*

Cheap Ice Houses.—At a meeting of the Elmira Farmers' Club, some time since, W. A. Armstrong said that a cheap ice house could be made out of a simple, well-roofed enclosure, without hollow walls or pits, or other costly apparatus. He leaves six inches of space next the sides all around, into which he rams clean sawdust closely, and covers the ice when packed with a foot of the dust. The ice is cut into large blocks and made to fit at the joints as closely as convenient, but where edges are jagged he fills in with pounded ice or sawdust—the latter being the cheapest. Drainage is important, but if the house stands on porous soil, or is so elevated that the water will run off readily, it answers every purpose. He had kept ice several years in such a building, nine feet square and the same in hight, the sides being only of inch boards. When the ice is taken out, be careful to keep all cavities covered with sawdust or it will waste away rapidly. In answer to a question as to the cost of a house 14 feet square, he said that $50 would pay for it and the sawdust; and built of cheap lumber it might cost only $25. In packing, spent tan or cut straw would answer nearly as well as sawdost.

Wire Fence.—The grassy angles between the walks in the dooryard can be kept free from intrusive footsteps by a low fence of telegraph wire painted green. Cut the wire in lengths of six or seven feet, and put each end in the ground, forming a semicircle. Midway between the two extremities of the first semicircle place one end of another length, and continue this simple fence as far as necessity requires. It should be about two feet and a half high.

Making Matches.

For those who care to experiment in making home-made matches, the following hints from the *Scientific American* may prove serviceable: The preparation is different according as they are phemical or lucifer matches. For chemical matches, put 40 grains of phosphorus in a wide-mouthed bottle. Add enough oil of turpentine to cover the phosphorus; then mix in 10 grains of flour of sulphur. Put the bottle in hot water until the phosphorus is entirely dissolved; stop the mouth of the bottle with a cork, and well shake the whole until it has become cold; afterwards pour off the supernatant oil of turpentine. Into the mixture of phosphorus which remains in the bottle, dip the extremities of the matches; and after some time, when they have become dried, drop them into the following mixture: Dissolve 30 grains gum arabic in a small quantity of water; add to it 20 grains of chlorate of potash, and mix them intimately together; then add 10 grains of soot previously mixed with a few drops of spirits of wine. In about 20 hours, the matches will be perfectly dry, when they will ignite on rubbing them over a rough surface. For lucifer matches, use one-third of phosphorus, and the remainder of gum arabic water and coloring matter like minium or Prussian blue. Mix in a water bath and muller carefully. The dipping is performed in the following manner: The melted composition is spread upon a board covered with cloth or leather, and the workman alternately dips the two ends of the matches, that are fixed in a frame. The fumes are very poisonous.

The Philosophy of Rain.

To understand the philosophy of this beautiful and often sublime phenomenon, so often witnessed and so very essential to the existence of plants and animals, a few facts derived from observation and a long train of experiments must be remembered:

1. Were the atmosphere here, everywhere, and at all times, of a uniform temperature, we should never have rain, hail or snow. The water absorbed by it in evaporation, from the sea and the earth's surface, would descend in an imperceptible vapor, or cease to be absorbed by the air when it was once fully saturated.

2. The absorbing power of the atmosphere, and consequently its capacity to retain humidity, is proportionately greater in warm than in cold air. The air near the surface of the earth is warmer than it is in the regions of the clouds. The higher we ascend from the earth, the colder do we find the atmosphere. Hence the perpetual snow on very high mountains in the hottest climate.

Now, when, from continued evaporation, the air is highly saturated with vapor, though it be invisible and the sky cloudless, if its temperature is suddenly reduced by cold currents descending from above, or rushing from a higher to a lower latitude, its capacity to retain moisture is diminished, clouds are formed, and rain is the result. It condenses, it cools, and like a sponge filled with water and compressed, pours out the water which its diminished capacity cannot hold.—*Ex.*

New Method of Preserving Wood.—A new method of preserving wood from decay has been recommended by Hatzfeld. It seems that, in 1830, specimens of oak were dug up in Rouen, which had been buried since the year 1150. This wood was quite sound, but had acquired a black color like ebony, and an astonishing hardness. Hatzfeld ascribed its preservation to the joint action of the tannin in the wood and the oxides of iron in the soil. Accordingly he now proposes to preserve wood artificially by means of tannin and the pyrolignite of iron, a combination which would in some measure bring about the same changes noticed in the specimens from Rouen. Hatzfeld impregnates the wood to be preserved, first with tannin, and subsequently with the pyrolignite solution. The latter substance has long been used alone as a preservative of the best character, and it is doubtful whether the addition of the tannin, as proposed by Hatzfeld, will prove of sufficient advantage to warrant the extra expense.

A Home-Made Barometer.—What is known as Bishinet's barascope is a simple and convenient instrument for foretelling a storm by change of atmospheric pressure. To construct it, take any bottle, and pour colored water into it to one-fourth its depth, insert in it a glass tube, from three to four feet long and passing air-tight through the stopper, which must also be air-tight. Let a paper index, divided according to any scale of division, say into inches and fractions of an inch, be glued to the glass tube. Blow into the glass tube, so as to cause the water to rise in it a few inches, say ten inches, and the instrument is constructed. The bottle must be placed in another vessel, and protected by sawdust, or some other material, from the influence of change in the atmosphere. This very sensible instrument records faithfully any changes in the density of the external air, and the approach of a storm will be indicated by a sudden rise of the water in the glass tube.

Gun-Cotton.—A loose yarn of gun-cotton, if gently set on fire by a spark, smoulders slowly away, but burns rapidly if lit by a flame. A charge of cotton in blasting a mine or quarry, or in a rifle, explodes after the manner of gunpowder; but if fired by a few grains of fulminating mercury, it "goes off" with terrific violence, and can therefore be applied for blasting purposes on a tremendous scale.

Good Health.

Delicate Operations.

Dr. Prengler, of Addison, Illinois, (*Chicago Med. Examiner,*) has transferred the blood of lambs into the human subject in two cases. The first was a young man who had been consumptive two and a half years. A healthy lamb was obtained, and secured on a board. Its carotid artery was laid bare, and surrounded by two loose ligatures, while one of the patients veins was prepared in a similar manner. Connection was made by cannula and rubber hose.

Compression of hose and artery, before employed to prevent loss of blood, was discontinued, and for ninety seconds a stream of vital fluid was allowed to flow into the patient's system, the quantity being estimated by the subsequently ascertained rapidity of the current, at about eight ounces.

Immediately a sense of warmth spread from the incision over the patient's entire surface; the face became flushed; the pulse slackened but full and firm, a slight *fullness* in the head increased to excessive vertigo; ringing in the ears was heard; vision became indistinct; *snowflakes* seemed to appear before the eyes, while a constantly increasing dyspnœa indicated a discontinuance of the transfusion. All symptoms disappeared in a few minutes, and nothing was observed until, after about two hours, rigors set in, giving away after fifteen minutes to a rather high fever, the temperature rising to 104°, the pulse to 115 beats, leaving the patient toward the middle of the night in a sound sleep. On the next evening the fever was repeated, but only in moderate intensity.

Very little change appears to have followed in the patient's condition. Hasse, of Nordhausen, Germany, claims to have cured several cases of advanced phthisis by this method, which he put in practice in forty persons. In the present case the account goes on to state, that an uticaria which Hasse had met with, appeared after eight days, covering most of the surface, and subsiding in three days; "its subsidence being accompanied with the vanishing of a strong *odor of lamb,* which had haunted the patient till now."

The second case was that of a man far advanced in phthisis. Ten or twelve ounces of blood was transfused in the same way. The effects were similar. Chilliness commenced immediately and the extremities turned blue, while the temperature rose to 104°. Reaction followed, but the result was not known at the time of making the report.

Bloodless Surgery.—A description of the Esmarch process for performing surgical operations without provoking the usual hæmorrhage, recently appeared in *Les Mondes.* The devices used in connection therewith by inventor are thus described: These consist of an elastic bandage, measuring 26 feet in length by 18 inches in breadth, and a tube or cone of strong vulcanized rubber, having a hook at one end and a chain and bar at the other. The application of the apparatus is very simple. Supposing that an arm is to be amputated, the hand is tightly wound around the member from the extremities of the fingers up to a little above the point at which the division is to be made. By this uniform compression the blood is forced back and out of the vessels. At the upper limit of the bandage the rubber end is passed three or four times around the arm, as closely as possible, and fastened in place by the hook and chain, thus preventing the return of the circulation to the member after the bandage is unwound. The latter on being removed, leaves the arm white and free from blood, and hence ready for the operation, which is accomplished with a very trivial effusion.

The Right Sort.—There is a class of cosmetics we can safely recommend, and guarantee that they will produce not only a clear complexion, but improve the general health. Our cosmetics are plain, wholesome, nutritious food, not vitiated with soda or spice, or lard, abundance of fruit (dried apples nicely cooked will answer), frequent ablutions of the entire body, accompanied with plentiful use of fine soap on the face as well as other portions of the surface, ample exercise in the open air, and early and long sleep. Three months' use of these cosmetics will improve the most hopeless complexion, and leave only the happiest after effects.—*New York Tribune.*

Hospital Hygiene.—Dr. Alphonse Gueriu, an eminent Surgeon of the Hotel Dieu, in Paris, has recently presently to the French Academy of Sciences a remarkable memoir on the influence of atmospheric germs on surgical maladies, in which he strongly advocates tow dressings for wounds. He states that, when this material is packed upon the injured part, the pus is completely preserved from putrid fermentation. He uses the tow in brief as a filter for the air, which circulates freely through it, and in fact produces an arrangement highly analogous to the cotton wool respirator mentioned by Professor Tyndall in his paper on haze and dust.

An English chemist, officially employed to detect adulterations, has reported 40 faulty samples out of 170. Arrowroot was mixed with starch, coffee with chiccory, milk with water, mustard with flour and turmeric, vinegar with sulphuric acid, etc.

New Remedy for Dysentery.

In a recent issue of the *Archives de Medicine Navale* is published an official note, addressed by Dr. Robert, who is the medical chief of the naval division of China and Japan, to the Inspector General of the Health Service in the French navy, calling attention to a drug used by Chinese physicians in the treatment of dysentery. It consists of the root bark of the *ailanthus,* very common in China, also cultivated in France and in this country.

The bark of the root is the only part employed. An infusion of the bark, however, exhales a slighly nauseous odor, and possesses an excessive bitterness, resembing that of sulphate of quinia. The Chinese physicians employ the root in the fresh state only; but Dr. Rohort, having been compelled to use some that had become dry, found no sensible difference in its action in the two states.

For administration, one and a half ounces weight of the root is cut into very small pieces and triturated with two ounces of hot water for a few minutes, in a mortar, in order to soften the herb, and then strained. A teaspoonful of this strong infusion is administered as a dose, morning and evening, alone or in a cup of tea. Taken in this form, it provokes vomiting. The medicine is administered in this manner during three days, the patient being kept upon full diet. After that time the *ailanthus* is omitted, and the diet is altered to broths until health is restored. If after eight days' treatment the patient is not cured, the Chinese physicians recommence the use of the *ailanthus;* but Dr. Rohert states that he has not met with a single case in which this resumption has been necessary, although he had under his notice some where the disease had lasted several months, as well as others of more recent origin.

The principal symptoms which follow the administration of the *ailanthus* are said to be nausea, and sometimes vomiting, followed by a temporary lowering of the pulse. The disappearance of blood from the evacuations commences on the first day, and is completed on the second; the colic ceases a little later. The effect of the drug upon the color of the evacuation is variable. Dr. Rohart sums up by expressing his opinion that the administration of the *ailanthus* gave superior results to those of ipecacuanha, astringents, alone or combined with opiates, or calomel.

The Germ Theory of Disease.—That hay fever, a disease quite prevalent during the present month, is traceable to vegetable organisms, is a curious discovery, tending toward the confirmation of the theory that disease is originated and propagated by independent organic germs, recently made by Professor Binz, of Bonn. The investigator has been himself subject to the malady, and has pursued his researches over a number of years. On examining the nasal secretions with a powerful immersion lens, he found the organisms to be absent, except when the disease attacked him during spring. Then the parasitical bodies were chiefly seen in motion, vibrating on the slide and increasing in size after several days. By using a neutral solution of sulphate of quine, applied by the nasal douche, Professor Binz found that the animalculæ were completely destroyed, and that subsequent examination failed to show their existence in the secretions.

Ether for Tape Worms.—When the anæsthetic power of ether was first discovered, it was only proposed to use it on human beings to render surgical operations painless. Yon Heydon, the merciful man who would not inflict pain on any living creature, employed it as long ago as 1830 for killing insects for his collection. Even worms are rendered dormant and helpless by its use. Prof. August Vegel now announces a new application of this anæsthetic for worms—its application to tape worms. The ether is enclosed in a gelatin capsule and swallowed. The ether is vaporized in the stomach and the worm stupified, it being then easily removed by any of the usual remedies, against which, when awake, the worm offers a strong resistance.

Sausages Colored by Aniline.—Aniline red is used to impart to sausages a fresh and healthy appearance. It can easily be detected by the use of alcohol or ether, either of which substances dissolves aniline, but not blood. This use of aniline red is severely reprehensible, not only from the fact that it is known to have caused the illness of entire families who have eaten meat colored with it, but also because, from its mode of preparation, it frequently contains arsenic, and must, therefore, act as a poison.

Antidote.—A post-office agent, traveling in Texas, tells of a successful use of the gall of a rattlesnake as an antidote for the bite of that reptile. In the case spoken of, relief was almost instantaneous to the patient, who was writhing in paroxysms of great pain, and rapidly swelling and becoming purple. We obtain the information from a local exchange. Sounds a little too much like "the hair of the dog, etc." What a simple remedy! and so extremely handy.

Water Contaminated by Copper Tubes.—Copper tubes, like those of lead, are objectionable for conducting water for drinking purposes. Experiment teaches that in a short time 1,000,000 parts of water contained 7·2 parts of copper. In another case the same quantity of water contained .8 part of copper.

S. S. FISHER.—We regret to have to announce the death of Hon. Samuel S. Fisher, our former Commissioner of Patents. Mr. Fisher and his son were both drowned while on a boating excursion on the Susquehanna river, on the 15th of August last. As Commissioner of Patents Mr. Fisher was the author of many reforms in our patent office, from which the inventors of the country have received and will continue to receive permanent benefits. As a patent lawyer Mr. Fisher stood at the head of the list and his decisions upon patent subjects were always characterized by reason and good sound sense.

NORTH PACIFIC RAILROAD.—Two fine narrow gauge passenger locomotives for the North Pacific Coast Railroad arrived in this city on Wednesday morning from the Baldwin Locomotive Works. This is good news for our friends in Marin and Sonoma counties, as they can see that it will now not be long before the road will be in running order. The engines are very handsome and serviceable.

IT is estimated that $20,000,000 have been invested in Colorado mines by New Yorkers; that the bullion product has been $3,000,000, and that the property now owned by the companies is worth $38,500,000.

MR. DUFFY informs the Carson *Tribune* that the acid works which were recently destroyed by fire, will be immediately rebuilt upon a much larger scale.

THE two potteries at Sacramento are doing a lively business. Both are enlarging their capacities.

THE Golden Fleece Tunnel, in the Peavine district, is now in 400 feet, and within 100 feet of the ledge.

THE Marysville foundry shipped last week to Battle Mountain, Nevada, a 10-stamp quartz mill.

San Diego Mines.

In conversation last week with Mr. Woods, from Banner District, San Diego county, we gleaned a few facts from that locality which are of interest. Mr. Woods tells us that of late a better class of population is coming into the district. There are a number of mining men from Grass Valley, Cal., and from Nevada, who are interested in the mines. It is a good sign for the district to see men coming from other mining localities to look at the mines. The Ready Relief mine, recently sold for $45,000 to Eastern people, will shortly be started up in first-rate running order. They have already a first-class 10-stamp mill with a 25 horse-power engine. The old mill was of three stamps and run by water power, which for the past two years has crushed from one to one and a half tons per day. This mine is situated in a peculiarly advantageous position for working. It is on the face of a bluff and tunnels are run right in on the ledge, no hoisting being necessary. One tunnel is in 150 feet, one 200 feet and another 150 feet, all three on the ledge. There is a shaft from the surface to the end of the lower tunnel, 110 feet deep, which is used as an ore chute. A small tramway was built about 60 feet long from the mouth of the lower tunnel and from it the ore is dumped about 30 feet right alongside of the mill. The creek runs alongside of the mill. They have had from 15 to 20 men at work for some time and for the past four months have used a five-stamp mill for crushing. No ore is being crushed until the new mill is completed.

The Helvetia is in Julian, the adjoining district. It was sold some months since to Eastern parties. They are now putting up hoisting works, with a 25-horse power engine to operate them. A five-stamp mill will shortly be erected at the mine. On the Owen's mine, now belonging to Booth & Co., a new shaft will probably soon be started as the old one has caved badly.

At the Golden Chariot, now known in the stock market as Chariot Mill, they are getting out very rich ore, and some of it is being selected and placed in boxes as specimen ore. The old shaft on the big ledge is 150 feet deep. The ore in this part of the mine was not very good; a drift was run to the eastward, to the "Joker" ledge, where they struck very rich rock. The ledge is very small, being only six or eight inches wide. The new shaft on the main ledge is about 180 feet deep; it is 600 feet north of the old one. In this new shaft they have got ore as rich as that in the Joker, but the ledge is from six to ten feet wide. This is the place where the very rich ore is found. This ore was struck about a month since. They have hoisting works at both shafts. The mill belonging to this company is four miles from the mine in San Felipe cañon. It is a ten-stamp mill of the most improved pattern, with copper plates, and five of Hendy's concentrators. A ledge, called the Young, has been found about four miles south of the Chariot on the same belt. The ledge is six feet wide and some of the ore crushed at Julian yielded $30 per ton; as the Chariot is four miles south from the cañon, and this mine four miles south of the Chariot, it gives some idea of the extent of the range. Mines are being worked some two miles north of the cañon, also. This belt of country is covered with ledges and has only been superficially prospected. Several other mines in the district are doing well, but the Chariot is the "Banner Mine."

OUR mint is turning out bullion by the ton: the coinage for last month was the greatest of any month in the history of the mint, being $4,120,000 in gold, 191,000 trade dollars, and $9,000 in half dollars, or a total in value of $4 320,000. It is the opinion of mint officials, judging from the receipts of crude deposits, that our California gold mines are producing more bullion than ever before, the dust deposits from gravel claims being constantly on the increase. For the eight months ending August 31st, the mint has coined $17,372,000. To give an idea of the ratio of increase, we append a table from the *Post*, which shows a comparative statement of the coinage of the San Francisco mint for the first eight months, corresponding with the portion of the calendar year just passed:

	GOLD.	SILVER.	TOTAL.
Jan. 1 to Aug. 31, 1865....	$ 9,642,000	$ 112,500	$ 9,754,500
" " " " 1867....	11,230,0 0	206,000	11,436,000
" " " " 1868....	7,035,000	442,000	7,478,000
" " " " 1869....	6,795,000	147,000	6,942,000
" " " " 1870....	12,533,000	276,000	12,809,000
" " " " 1871....	12,560,000	680,775	13,240,775
" " " " 1872....	9,920,000	339,540	10,259,540
" " " " 1873....	12,972,000	206,400	13,178,400
" " " " 1874....	15,325,000	2,047,000	17,372,000

SILVER NEAR CALISTOGA.—The greatest excitement has prevailed in Calistoga for the past few days, occasioned by the discovery of three distinct silver-bearing ledges west of the Calistoga silver mine. The croppings are bold, and assays prove the existence of gold and silver in small quantities. Between 200 and 300 claims have been located, and the Recorder and his deputies are busy recording and surveying claims. About 100 prospectors are daily seen climbing Mount St. Helena, and the reported successes of the Calistoga company bring new arrivals by every train. The first clean-up of the Calistoga mill will take place on the 15th instant.

THE Eberhardt and Aurora mines, White Pine, are turning out their usual quota of high-grade ore.

Mill and Mining Supplies.

An enterprise has been started in this city within the past few months which is of considerable interest to the mining community. Messrs. Kabath & Ladd have established themselves here as dealers in mill and mining supplies, intending to deal exclusively in articles for mining purposes. They rightfully judge that they can supply and sell goods of this class cheaper than parties who keep them only as an adjunct to their business. By making a specialty of this, they will in course of time accumulate considerable information which will be of benefit to customers, and which can be got at in no other way, as they will have better facilities for posting themselves than those who do a miscellaneous business.

Although the mining interests are so large and important on this coast, no one has heretofore attempted to establish a business intended specially to furnish mining supplies. This is somewhat strange, but we have no doubt that several establishments of similar character will be started before long. The business of mining is enormous on this coast, and is growing every day; so that it actually requires men who understand the business, and who make a specialty of it, to furnish the necessary supplies. A good many persons take charge of mines, or are connected with them in an official capacity, who have very little idea as to prices or quality of supplies. By purchasing promiscuously they pay two or three times the value of the articles bought. The firm to which we refer have an established price, from which they do not deviate. The only difference they make in price is whether goods are bought for cash or on time, or in large or small quantities. The prices established give them a profit of about two and a-half per cent. and they inform us that their facilities are such that general dealers can not undersell them. In some cases, where time is called for, they expect a profit of five per cent. on the goods, but never higher than this. Most any person will realize that these figures represent a much smaller profit than is usually made. They import their goods themselves, and have sufficient capital to carry on a large business with every facility.

It will of course remain with mining men to support an institution like this. It is always difficult to establish anything new, but this is intended for miners, and they should post themselves about the house, and not let an establishment like this fail for want of support. They have no intention of monopolizing the trade, for they fully expect, themselves, that five or ten similar houses will start in when they know this is a success. What they rely on is their ability to sell good articles at a low figure. People can purchase good or inferior articles as they choose to pay the price for them; and Messrs. Kabath & Ladd state that other dealers who only deal in mill and mining supplies in a small way cannot sell the same goods of the same quality at the same prices they do. They guarantee all first-class goods at an advance of from two and a half to five per cent., according to size of order. They are willing at any time to send their price lists to parties desiring them, and give such information concerning them as is wished for. It is useless to enumerate the many things comprehended in "mill and mining supplies," as every miner can understand what a varied list of articles the phrase covers; but these parties keep everything it is possible to mention in this connection and can fill the largest orders.

Messrs. Kabath & Ladd are also agents for the Laflin & Rand Powder company, the largest manufacturers of powder in the world, having five and a half millions of dollars invested in the trade. They make half of all the powder used in the United States, and claim that it has 25 per cent. more strength than any other powder. It is sold at the same figures as other brands of powder, and is packed in metallic kegs. In a conversation this week with one of the gentlemen who has started this business, we were informed that they had been quite successful thus far, and were very much encouraged. We hope to see before long a dozen similar establishments which have for their sole object the furnishing of mill and mine supplies.

THE Tacou country advices from Fort Wrangel, dated August 16th, state: H. N. Steele's party from the Tacou country returned this evening. They traveled up the Tacou river 150 miles to the forks. The whole country is nothing but a succession of quartz ledges. They found gold all along, but not in paying quantities. They think they did not go far enough by at least 150 miles. They represent the country as having a much milder climate than Cassiar, not over timbered, with prairie patches occasionally, in which grass grows to the hight of seven feet, and fruit and game of all descriptions exist without limit.

THE BLACK HILLS.—General Sheridan has issued an order to Brigadier-General Terry, at St. Paul, saying that unofficial information has reached his headquarters of the organization of parties at Sioux city, Yankton and Bismarck to invade the Sioux Indian Reservation, with the view of visiting the country known as the Black Hills. Should such information be correct, you will please notify such parties that they will not be permitted to go, unless under authority from the Secretary of the Interior or Congress.

Introducing Patented Articles.

In a recently published work entitled "Manual of Patent Law" by William E. Simonds, considerable space is given to the subject of the sale of patents. This subject is a very interesting one to inventors and is well treated by the author of the work in question. In speaking of the different methods of sale he has the following to say about "newspaper advertising," and we commend his remarks on the subject to the attention of inventors:

Another method of getting an invention before the public is through the medium of newspaper advertising. This is more expensive than the method just described, and is not, perhaps, advisable till that fails, though it may be often happily used in conjunction with it. If the inventor can afford it, it is well to have the invention illustrated and described in one or more of the scientific and mechanical publications of the day, of which the *Scientific American* and the *American Artizan*, of New York, and the SCIENTIFIC PRESS, of San Francisco, are notable examples. Such illustration and description may sometimes, of itself, prove sufficient. If not, it may be followed up by ordinary advertising; or, this illustration and description may be dispensed with, and the advertising confined to the regular advertising columns. In doing this, the advertisement should be inserted in the paper or papers which are designed to meet the eye of the class or classes of persons to whom the invention is of special interest. Any reliable advertising agent will be pleased, on request, to furnish, free of charge, a list of any required size, extending over the whole country or any part thereof, which circulate among any special class of people, and the advertisement of the invention should be inserted in one or more such papers, as the judgment and means of the inventor may dictate. It is very much better to insert a small advertisement in a large number of papers, than to occupy a large space in a smaller number. The experience of old advertisers confirms this proposition. If the inventor is not skilled in writing advertisements, it will be best for him, if possible, to get some properly skilled person to write the advertisement for him; for it is no common accomplishment to be able to put into a small space, in an attractive and striking and yet not vulgar manner, a notice of any thing, which shall say just enough to induce the reader to push further inquiries. Suppose the invention to be an improvement in the manufacture of coach varnish: an advertisement something like the following would not be inappropriate:

A NEW COACH VARNISH.—A most valuable patented improvement in COACH VARNISH is offered for sale; thoroughly tried and tested.
Address, T. W. COPAL, Haysbope, Conn.

This will occupy but few lines of space, and yet tells enough to interest varnish and coach men therein. It is not advisable to make much parade of the patent *as a patent*, for there is something of a prejudice among business men generally against patents, on account of the great number of humbugs which have been pushed into notice under their guise; but this prejudice vanishes, when they discover that the patent covers a real improvement.

The proper papers in which to insert an advertisement like the above, would be those which are intended for circulation among varnish users, varnish manufacturers and carriage builders, a list of which, with the charge for insertion, the advertising agents can readily furnish. When answers to advertisements are received, they can be replied to by such a circular as that hereinbefore described, accompanied by a letter substantially like that set forth, changed to meet the requirements of the case.

The inventor must not be afraid, if his means permit, to continue his advertising for some little time; for experience has shown, that, unless a person is more than ordinarily interested in the matter advertised, he has to see an advertisement a number of times before he will take any active step in reference to it.

SACRAMENTO SMELTING WORKS. — A correspondent of ours, who visited these works last week, says that the site is wisely chosen, as far from the crowded sections of the city as possible. Here, on an area of two blocks, the company have erected suitable buildings and are already in vigorous operation. As soon as their machinery is all completed, they expect to do a large amount of business. The furnaces are now in operation on rebellious ores from Salt Lake, yielding $130 per ton. They will be able to refine all bullion, and expect to be in full operation early this month. The process is that of Ballhack, of New Jersey. A piece of apparatus, known as the "pay car," is in operation at the works; it is the invention of Thomas H. Cameron, the foreman, and will be fully described as soon as the patent is received. Mr. Cameron is also patentee of the self-dumping mould in use at the works. No Chinamen are employed at these works.

YIELD OF THE COMSTOCK.—The present daily yield of the Belcher mine is 550 tons of ore; of the Crown Point, 500 tons, and of the Consolidated Virginia, 300—making a total of 1,350 tons of ore from three leading Comstock mines. In addition, the Chollar-Potosi produces daily 100 tons; the Sierra Nevada, 60 tons, and the Hale & Norcross, 30 tons—making an aggregate of 1,590 tons from the seven mines.—*Virginia Chronicle.*

Steam Engines at the Fair.

On page 150 of this issus will be fonnd some remarks on the steam engines on exhibition at the Mechanics' Fair. We continus below our notices of these exhibits:

Near the trip-hammer is one of ths celobrated Hoadley portable englues, so much used for threshing and other farm and general purposes. The efficiancy and safety of those engines have been very universally anknowledged in all parts of the Union. Many improvements have been made from time to time to their original construction, under the immediate supervision of Mr. Hoadley himself, one of the latest and not the least of which is the automatic variablo regulating cut-off, which adds greatly to its economy of power. This engino is also exhibited by Treadwell & Co.

Joat beyond the above is a similar, but somewhat more pretentious engine of this closs, exhibited by Baker & Hamiltou. This engins is from the Ames' iron works, Oswego, N. Y.; is of the locomotive patturn, and very superior finish. It is designed for thn same nlass of work as the Hoadley engine, and is operated in ths Pavilion by steam conveyed direct from the boilers. The bolster is placed under the rear of thn boiler, over the fore wheels, which arrangement brings the weight of the farnace and forward end of the boiler on the hind wheels of ths truck, the axles of which are carved to the shape of tho under part of the furnacn oud of tho boiler, whieb it snstains. It may be remarked tbat all thn steam engines of this class iutended for farm work and other general purposes are constructed with special regard to safety and simplicity of parts and management in its running.

Baker & Hamilton also exhibit the Baxter engine, manufactured by ths Colt's Patent Fire Arms Manufacturing Company. This is considered very superior as a small engins for general work, and makes steam in a very economical manner—the draught is up and down and up again, by which a very largs amount of heating snrface is obtained for so small an amount of space occnpied. All the heating is below the watnr line, hence thsrs is little or no liability of burning out the boiler. Special pains is also taken to secure a perfect circulation of water. Tbn engine is built upon, and secared to, the cylinder, while the lattsr greatly economizes its usn of steam by being immersed in that of ths boiler.

Returning to a poiat near tbe horticultural department, we find atill another class of small upright, portable engines, exbibited by Treadwsll & Co. This engine is manufactured by the Nsw York Safoty Steam Power Co. Ons of its leading pscnliarities consists in placiug the engine separate from and by the side of the boiler, instead of upon or in any way attached to it, sxcept at its base; hence, it cannot be affected hy the expansion or contraction of the bo ler or unnecessarily heated by conduction from the same. The sngins consists of two principal parts, ths cylinder and ths frame—the latter consisting of a tapering column of enrved outline, having liberal openings to allow of free access by the attendant to all its working parts. Ths form is gracsful in design and simple in mschanism. Special attention has also been giveu to prevent foaming in the boilsr, and to render it otherwise safe and reliable.

Thesa two engines—the Baxter and tbat of the Safety Steam Power Company—have each been dsvised with the ntmost regard for svery essential of service and safety which is within the power of the best mechanics and builders in ths coantry to deviss, after years of nareful study and experiment. Tbe former has been placed npon the market by a company of world-wide reputation for its skill in producing special tools and machinery. Its engines are bnilt with the aame care that is devoted to perfecting the celebrated fire arms by the company, every part of the engiue being interchangeable, as is the case with the pistol; the importance of which fact is well understood by all who are familiar with machinery. The latter is manufactured with equal care at one of the largest machine worka of the kind in the country, located at Hope Valley, R. I. For printing offices, small machine shops, and wherever a small, safe power is needed, these engines are most pecnliarly adapted. These two forms of engines are so well guarded against danger of communicating fire that we believe insurance companies, by common consent, make no extra charge on buildings in which they are employed.

Tbe class of small portable engines, if we are not mistaken, is a specialty in America, and is seldom found in any other country. Their existence renders more practical the possibility of smaller establishments, carried on extensively in this country, and which are so seldom met with in Europe.

The Steam Fire Engine.

We come now to consider one of the latest successful applications of steam—for operating fire engiues. Long after steam had been introduced for almost every other purpose for which power was required, the world was indebted to firemen's muscle alone in its olt and terrible conflicts with the fire fiend. Even after tbe idea of applying steam to working a fire engine was fairly broached, many of our best engineers and mechanics were fully impressed with the idea thet the project was utterly impracticabls—tbat too much time would be reqnired to get up steam; that a steam power attached to a fire engins would ronder the entire machine too bulky for ths celerity of motion and antion required in ths emergency of fires in ths crowded streets of a city. But Yankee ingenuity and enterpriss finally overcame all obstacles, and we hava to-day steam fire engines so perfectly constructed and so admirably adapted to the character and celerity of the duty required of thsm, that thers is scarcely any point left in which any considerable possible improvement can nven be imagined. There is no application to which steam has been applied wherein it has reached a more complete success.

Hitherto all the steam fire engines in use on this coast have besn built in the Eastern States; bet we havs to day on exhibition in the Pavilion an engine of this class which is altogethnr of California maks and design. This machine has been manufantured in this city by Goodwin, West & Co., and is supplied by the wsll known Goodwin pump. The engius itself is very handsome in its finish and ornamentation, and is said to weigh 500 pounds less than a second-class Amoskeag engine. The pump is so placed that it can ho readily taken apart without interference with the working gear of the engine, or any other part of the machinery.

A. L. Fish exhibits a fire engine manufactured by Clepp & Jones, Hudson, N. Y. This company is evidently doing considerable business in this connection, as the machine on exhibition is No. 128 of their manufactnre. We understand that San Jose and Virginia City have each supplied tbemselves with one of these machines. All tho other steam fire engines on this coast were furnished, ws believs, by tbe Amoskeeg Company, of New Hampshire.

The leading impressiou left on the mind after a careful examination of ths various steam engines on sxhibition is the multiplicity of its applications, and the almost infinits variety of forms which it is mads to assums. Visitors will here see, as has been shown, the engine fitted to almost svery class of work dsmanded by ths mnltifarious wants of the world's toilers, and producsd by the united skill of our most eminent mechanics and engineers. Some of these devices, though strange looking and incomprehensible to many, will be readily explained to the attentive enqnirer; while to the thoughtful and reflective they will lead to a more correct appreciation of the advantages tbey afford, and thus establish a better friendship between the man and the machine.

Within the last twenty or thirty years the patent office records show that many hundreds of patents have been granted for improvements in the steam engine. The efforts of inventors have been directed to every detail—even to the most minute. During this time the engine has undergone almost as many modifications as there are pnrposes to which, and forms in which, it has been applied. Most of the inventions patented have had reference to economy in fnel or in the use of steam.

To show the progress which has been made in improving the steam engine, we give, from an English estimate, the mechanical effect produced by a given amonnt of heat-producing material at different periods, as follows:

By Smeaton, before the application of the condenser, an average of 9,450.

By Boulton & Watt, highpressure steam, worked expansively, an average of 15,785.

By the latest improved Cornish engine, an average of 54,000.

In the consumptiou of fuel Smeaton's average result was, 17 pounds of coal consumed per horse-power per hour.

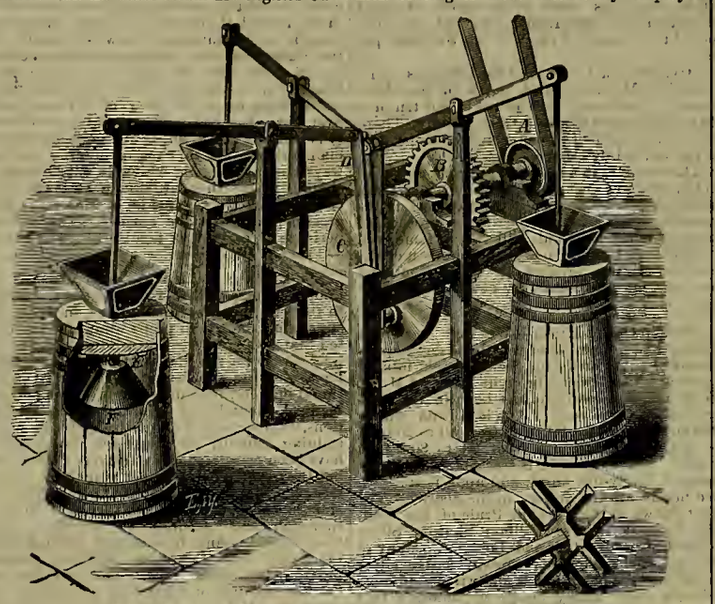
Watt's usual result was 10½ ponnds of coal per horse-power per hour.

The usual result in the best modern engines nsing high-pressure steam, expansively, is 3 pounds of coal consumed per horse-power per hour.

New Books.

Simonds' Manual of Patent Law is a book of 250 pages, containing information to inventors and patentees. Such a book has long been needed, and should meet with ready sale. The present work contains a plain and complets statement of the various laws, rules and conditions attendant npon application for patents, prosecntion of patsnt applications, rules of patent practice, and general instructions to inventors and patentees. It contains no surplus verbiage nor unintslligible decisions, snch as patent law books are generally mads up of, but its mannsr is concise and plain so as to be readily understood by every intelligent inventor. Ths work also contains soma sensible advine in regard to the sale of patents, together with a synopsis of Foreign Patent Laws, and a census table of the Statss arranged by counties, all of which is important and usoful to the patentee. Mr. Simonds is a nonsellor in patent cases, residing in Hartford, Conn., and has succesded admirably in producing a Patent Law Mannal or Hand-book, which will be of bensfit to the Patent world.

A Treatise on Bracing with its application to bridges and other structurss of wood and iron, by Rubert Heary Bow, C. E., has besn received from A. Romaa & Co. The book is a small one, comprisiug some 50 pages, with 156 illustrations on stone. The subject is one of much importance, and is briefly but olsarly treated. As bridges are the structures in which bracing is most extensively employed much is said of them; bnt, as the intention of the anthor is merely to explain its application, those parts which either influence or ars infineuced by ths character of ths bracing alone come strictly within the scope of the treatiss. In a few instances thn autbor may havs gone beyond this intention, in the belief that ths space so employed wonld not bs deemed unprofitable by the reader. The work treats mainly of the doubls acting or triangular method of braciug, but it is not strictly confined to that system, so it will supply an important desideratum in the library of the engineer.



RIDLER'S IMPROVED CHURNING APPARATUS.

Will's Table for Qualitative Chemical Analysis has been issued by Henry Carey Baird, the well kuown "industrial publisher," 406 Walnut street, Philadelphia. It is the second American, from the ninth German editiou, and was edited by Prof. Charles F. Himes, Ph. D. There is an introductory obapter on the "Course of Analysis," by Prof. Heinrich Will, of Giessen, Germany. The tables in the work, while compact, are sufficiently explicit. This edition contains, besides the marks of careful revision, two new tables by the anthor, embodying Bunsen's valuable flame reactions, and whilst nothing in the original has been omitted or changed, new matter has been freely added by the editor, generally placed in brackets. Thus other methods for the separation of the alkaline earths are given, and an additional table added for the detection of metallic oxides, which may replace parts of two other tables with the advantage of greater simplicity and directness. The ohapter on the "Course of Analysis" from the original is added, with the hope that it may relieve any inconvenience in directing the use of the tables. Compactness, completeness and general intelligibility have been mainly considered in the book. The work is one of great usefulness, and shonld be in the hands of every chemist and student in every laboratory in the conntry. The pnblisher will send it post paid for $1.50 to any part of the United States.

Encouraoino reports are received from the mines in the Cornucopia district.

Improved Churning Apparatus.

Ws illnstrata this week a devics invented by George Ridler, of Rickardsville, Dubuque connty, Iowa, who intsnded to fnrnish a convenient means of opersting a single churn, or any desired number of churns at once, in accordanca with the amount of cream used and power to be applied. To ths end of the driving shaft is attached a hand crank or a pulley, *A*, which is connected by a belt to a saitable motor. The shaft rotates in bearings in the frams work of tha machine, and carries a large gear wheel, *B*, which, through a smaller wheel below, actuates a balance disk, *C*. To a crank pin on ths latter are connected the rods, *D*, which, through the horizontal levers, pivoted to supports on ths frame, commnnicate motion to the churn dasher shafts. The frome of the apparatus may, if desired, rest upon a platform, in which recesses may be made for the reception of the lowsr portions of the churns. Ths peculiar farm of dasher represented in the foreground of ths engraving is mads by halving two bars to each other, and attaching them at their centers to the extremity of the dasher handle. Ths middle portions of ths ends of the bers ars cnt away, and ths arms thus formed are made V shaped upon the npper side, while they have groovss of similar contour on their lower faces. The undsr side of the middls portion of the dashsr is nonnaved, in order to gain a better hold upon the milk, and to prevent spattering. In the cover is formed a chamber, of which the funnel shown forms an upward continuation. Ths object of the chambsr is to receive the milk and fine butter which may be carried np by ths dasher shaft. Its bottom is formed by attaching to ths cover a plate, *E*, ths undsr side of which is made convex, so as to scatter the milk that may bs projected against it by the dasher. This plate is secnred by screws and may be readily rsmoved for cleaning, etc. Instead of the form already desoribed, the dasher may be made of the shape shown at *F*, its upper side bsing conical and its base slightly concavs.

In describing the churn the invsntor says: When the apparatus is in operation, it can be seen at a glance the usefnlness of my inveution. It will make mors and better butter than anything evsr invented for the purpose of churning. It works with ease and quickness; a child five years old can churn with it, and no cream will be spilled, worked with the funnel top and save-all chamber nover. Tho improved eight-finger dash not only churns, but by turning ths machins slowly after the butter is come, gathers it. We havs bsen in the dairying business 40 years, and have tried almost every kind of churns, and found by experience that the up and down dash churn is the best we ever tried. We experimsnted with four gallons of cream; we churned it in a rsvolving churn, got all the butter ws could, then put the buttermilk in a stone churn, worked with the machine and got a pound and a quarter of batter from the buttermilk; and we know it is impossible to maks as good butter with a revolving churn as with the old fashion dash churn. Conseqnently my churning apparatus will pay for itself in one month with a dairy of six cows. A singls machine will weigh about 50 pounds; it tekes but little room, only 12x18 inches, and will do the churning for a dairy of a hundrsd cows, and would be an ornament to any dairy room, and is always ready for use. All you have to do is to put ths churn on the platform and work the machine, and if the cream is of the right temperature you will get butter in fivs minutes.

The Patent Office.—We regrst to learn that the mania for change has again attacked the management of our Patent office. If there is any one department of our Government in which a frequent change in its working force operates heavily upon the effectiveness of the department we think it is the Patent office. An examiner in the Patent office must be familiar not only with mechanical theory bat also with the routine of the office; must be able to refer to former actions of the office readily, and the longer an examiner has been connected with the office the greater his efficiency and value on this acconnt.

Prof. Hedrick, who has for the last fifteen years had charge of the Chemical Department in the Patent office, we learn is to be removed, and a young man put in bis place. Under Hedrick's management, the chemical class, which is always a difficult one to manage, has been especially effective. Its work was thoroughly done, and the action upon applications presented to that department was unusually prompt and well considered. We hope that the Commissioner will reverse his action in removing Prof. Hedrick, and retain him in a class in which he has proved himself to be extraordinarily well suited.

The Briggs' creek mines, in Jackson county, Oregon, are being worked with considerable success. There is plenty of water and quite a number of miners, who are constantly receiving accessions to their ranks.

The American quicksilver mine, in Lake county, recently purchased by Geo. S. Wright and others, Wednesdsy made its first shipment of 45 flasks, the result of 15 days' run with six retorts.

Little Cottonwood Mines.

A correspondent of the Salt Lake *Tribune*, at Alta, says: During the past week we have been having a little war at the McKay mine. Last seaeon J. P. Harlow and Walter McKay bonded this mine to Selby and Gunter, said bond coming due some time last apring, but by mutual agreement the time was extended to the 1st of August, then another extension to the I0th, but the parties failing to come to time on the last extension, Harlow wanted possession, which was refused. Watching his chance last Monday morning, he found no one in the mine, so he at once took charge, hoisted the stars and stripes and put an armed force in possession. A few honrs after, Mr. Gunter having returned from a fishing excursion to Big Cottonwood, and finding an armed force in possession of the the property, at once proceeded to Salt Lake City, swore out warrants for Herlow and several others, and Depnty Sheriff Florida came up and made the arrests; hnt as soon as the arrested party stepped out another crew stepped in and filled their places. The next dey another lot of arreets were made, and another force were in readiness to fill their pleces in the mine. J. P. Harlow, having been released on bail, returned and held a consultation with Mr. Selby. A compromise wae effected by which Harlow holds possession till it is tested in the courts, which will be the 3Ist of the present month. It is generally thonght that Harlow is in the right, and he has the sympathy of the miners.

Other mines are moving along about as usnal and shipping considerahle ore, hut it is not quite as lively as we could wish. Dull times are the general complaint throughout the whole country, and I think our camp the best in Utah. The Flagstaff is shipping ahout 75 tons daily, and the mine looks well; in fact, it is the main stand-by, and always hae plenty of ore in eight.

The Emma hes quite a force prospecting, hoth einking and running drifts; and it is hoped a new ore body will be found soon.

The Ohio ia working in a fine body of high-grade ore, and is daily ehipping quite a qnantity; it will soon have a whim in operation, when its shipments will he increaeed.

The Reed & Benson is working about 25 men, and the mine is said to be looking well. A whim will soon be erected, which will greatly facilitate the working of the mine.

The Davenport hae heen leased hy John Young, and is being worked hy a small force, hut there is hut little ore in sight.

The Wellington has again suspended operations for some cause beet known to its owners.

The Fuller is looking tip-top, and its shipmente will he materielly increased as eoon as the new whim, which ie now being constructed, is completed.

Mail Troubles.

Still we are compelled to put up with a tri-weekly mail, when plenty of otber towne in Uncle Sam'e dominione, not receiving one-half the mail matter we do, are furnished with a daily one. We have repeatedly petitioned Col. Wickizer for relief, hut all such petitione have never heen heard from, and it cauees much dissatisfaction in this hurg, and it is hoped the Colonel will aoon do something for us, or at least let us know what he intends to do.

The Ingersoll Drill.

A correspondent of the Grass Valley *Union* says: Over a year ago the Milton company, at French Corral, made arrangements with the agent of the Ingersoll Drill Co., of New York, to experiment witb their machine, in the company'e hedrock tunnel. After expending a large sum of money, under the direction of the Drill Co.'s agent, W. S. Pinney, found they had not power enough to run the air compressor to drive the drill. Satisfied with the working of the drill, with the emall power attached, they have erected ample machinery to drive the air compressor up to any power required by means of a hurdy wheel. The drill is now working successfully, under the management of C. S. Davis, Esq., who ran the Burleigh drill in the Mt. Cenie tnnnel for two years. He hes only heen operating the drill a couple of weeks, and is highly pleased with ite work—making at thie time 24 feet of drill hole in a shift of eight hours, with two drills, and eays that mnst he increased to 30 feet in the same length of time, within one week from thie writing. He hae had everything to contend with to make it perplexing, in the way of inexperienced help, and help too thet did not want to see the machine take the place of eingle-hand drills. He is determined to make it a snccess, if it is at the discomfiture of some of the old confidential hands of the company, hy giving them their time to he carried to the superintendent's office. It is certainly a great overeight in workingmeu to "buck against" modern improvements and machinery. Mr. Davis is eanguine that he can break four feet line of rock every 24 hours after he gets his workmen all accustomed to the work and machinery. The superintendent of the company, Mr. V. G. Bell, wonld be pleased to see the mine owners throughout the county pay a visit to their worke and see the drill running.

New Hoisting Works.—The Murchies are going to erect new hoisting works at their mine known as the Lone Star, and we presume will also huild a mill at the same time, although they have one about half a mile dietent from the Lone Star. This ledge promiees to be one of the richest in this vicinity. It ie large and has paid well as far as worked.—*Transcript.*

New Discoveries in San Juan.

The Boulder *News* (Colorado) gives the following acoount of the new discoveries made lately in the San Juan country: On Tnesday last, on the Young America lodge, which is an extension of the old America owned by Jackeon & Fullen, when a depth of 10 feet had been reached, a crevice of about two inches in width was strnck, the ore of which was very rich looking, equel in every appearance to the ore from the original American, so well known to your readers. It will be remembered that Prof. J. Alden Smith purchased ore from this lode and paid a good price for it. It has become a matter of considerahle sport that the discoverer of the Young America, while sinking his shaft, was offered five dollars for a half interest, which offer was accepted, and now it turns out to he one of the richest lodes in the district. After striking the pay streak where it was two inches wide, at a further depth of two feet it widened out to I2 inches.

The Wood Bros., on the same day, struck a rich tellurium lode under the corner of their cabin. One of the Wood Bros., and a man by the name of Green, discovered another good lode about 200 yards northeast of Wood's honee.

On the Osceola lode, B. Hanna has got a good milling ore at a depth of I0 feet. It aseaye $400 per ton and is nearly the same as the America ore—free gold and tellurium.

On the Silver Dale lode free gold has been struck at a depth of 25 feet. Crevice ahout two feet wide.

The owners of the Tennessee lode, at a depth of 20 feet, have come upon a rich vein of gray copper.

Morrieon, on the Grand View lode, at a depth of 40 feet, has come upon a good streak of tellurium ore. Specimens exhibited are supposed to be worth at the rate of $I00,000 per ton.

Day, Jones & Co., have two rich lodes and a tunnel on Mt. Hope, just north of San Juan camp. This tunnel ie expected to cut ten or a dozen lodes, and will he pushed rapidly. There are quite a number of veins on Mt. Hope now being worked hy other parties.

This camp is increasing in dimensions on all sidee, and now occupies a space of at least two aqnare miles. The rueh of new comere ie increasing daily, and prospecting is proeecnted with great vigor. Gold Hill has a fame well estahlished, but this new San Juan ie now absorhing all the interest in mining mattere amongst the prospectors for new discoveries of rich lodes.

Schell Creek Mines.—We were yesterday shown a large number of very handsome speoimene of silver ores from Schell creek mining district. They were brought here hy M. D. Bowie, a gentleman who has heen in the district about three years. The lead from which the epecimens were teken is from 80 to 200 feet in width and crops out from 60 to 80 feet in hight. This huge vein ie traceable for a dietance of thirty-five miles, and upon it are locoted nearly all the mines in the district. The hest known of these are the Pride of the West, the Wide Weat, the William Sharon, Silver Wreath, Cow and Calf and Lookout. Many of the specimens ehown ue contain native eilver in the form of small flakee and wires, and some of them were eimply lumps of chloride that were nearly pure eilver. What they need in the district is a good mill, and to indnce some one to go out there and put up a mill appeare to he Mr. Bowie's principal business in thie pert of the State. Their nearest mill is at Eureka, distant 125 miles from the minee. The ores hauled to this mill and reduced have averaged over $1,300 to the ton.—*Virginia Enterprise.*

Specimen of Cobalt.—We were ehown this afternoon, by J. N. Rnseell, a beautifnl specimen of cobalt from Lndwig & Carter's mine, near the head of Walker river. There is a large deposit of the mineral in that locality, and it ie being extensively worked. The ledge hae been tracod for a long distance, and ore is being taken out in five or six places. The most of it is sent to Birdsall'e mill, in Dayton. When the Bluestone works in Carson are rehuilt, they will also consume a large quantity. The rate of freight from the mine to Dayton ie $20 a ton. Mr. Russell informs us that a great deal of prospecting is heing done on Walker river at the preeent time, for silver, copper and other mines. Some of the indications appear very favorahle, and valuable discoveries may he made.—*Virginia Chronicle.*

Yield of Ore.—The daily yield of ore of the Crown Point mine ie 500 tons; of the Belcher, 450 tons; of the Conecolidated Virginia, 300 tons; of the Chollar-Potosi, 80 tons; of the Sierra Nevada, 60 tons; of the Hale & Norcross, 50 tons; of the Juetice, 40 tons; making a total of 1,480 tons, I,200 tone of which are produced from three leading minee. In addition, the Ophir, Woodville, and several other mines are shipping ore in greater or less quantities.

The oake of Lake county being large, afford excellent material for the manufacture of staves. William Curry, of Sonoma conty, is at present engaged in making oak etaves in Scott's valley, for Fuller & Co., of Petaluma. He will have 30,000 stavea ready for delivery hy the Ist of Septemher. They will be of different eizee, and used in the manufacture of wine pipee, barrels and butter kegs.

There are five companies working in the river between Placerville and the Clements bridge—four heathen and one white.

Creeping Clay.

A peculiar kind of clay is found in many places in our mines, whioh is not a little curious on account of its oreeping propenalities. A stratum of this olay will crawl out into tunnels and other openinga in a manner much resembling the action of the toy known as Pharoah's serpents. You can't see where it is coming from or what moves it, yet it is constantly crawling out. In the drift which is being run into the American Flat mine, at a depth of 750 ft., they have a stratnm of this clay. In order to keep the drift open, it is necessary to keep one man constantly engaged in cutting away the clay as it pushes itself into the drift. This is not owing to the slaking and swelling of the exposed surface, as in that case after a few removals of the surplus material a hole would be left. The whole body of clay appears to be creeping. It has the almost imperceptible motion of the glacier, and, like the glacier, irresistibly advancee, smashing everything in the shape of timbers that may he placed in its way. The cause of this creeping is probably to be found in the preesure of the superincumbent or surrounding strata of rock. Its motion is not unlike that seen during the etraitening out of a piece of pith which has been compressed. There appears to be a limit to this creeping of the clay, hut it ie not reached nntil many feet have crept out into the drift, tunnel, shaft or chamher, and been cut off and removed. Its action is so mysterious that some of the miners are ready to explain it hy simply saying that it is becanse "nature abhors a vacuum." If left to ite own course it wonld very eoon cloee the drift, tunnel or other opening so completely that no one could eee that an opening had ever been made in it; indeed, thousande of feet of drifte and tunnele in onr mines are now so closed. In the Caledonia mine much trouble was experienced with this creeping clay. We have heard of a streak of it two or three feet in width rising np in the floor of a tunnel until over thirty feet had come up and been cut off. It ie bad anywhere, but is most mischievous in main shafts. For this reason mining men always seek a sport, in which to put down such shafte, where they are likely to have solid country rock (rock outside of the vein) to a great depth below the surface. The ead experience of early days taught them the lesson. —*Virginia Enterprise.*

Eduoation in California.—Mrs. Sarah B. Cooper, whose addrees is at the *Overland* office in this city, has isened a circular, in which ehe states that ehe has in preparation, for the United Statee Commissionere of Edncation, the annual report for the State of California. Circulare, soliciting information in regard to educational mattere, inclnding librariee, museume, medical, dental and pharmaceutical institutions, benefactions, asylnms, schools of science, training schools, art, teachers' salaries, etc., have been circulated ae extensively as poseible, but the experience of former years have proved this plan to be inadequate. As the Commissionere desire the forthcoming report to be as thorough and accnrate as possihle, Mre. Cooper eolicits any information hearing npon the topics ahove named, or anything pertaining to educational growth and advancement that the patrone of education throughout the State may desire embodied therein. All such matter mnst he ae clear and concise ae the eubject treated will permit.

Sunnyside.—Benson has just made a run from his Geneva lode, in the Sunnyside etamper, obtaining five ounces gold per cord from surface ore. The vein carries three feet in width of such rock, and is easily mined. A number of cords were rnn, enough to make the most satisfactory test. The ore ie soft, the gold free, and the location near the mill. Facilities for economy and conseqnent profits of working, were never hetter. The reenlt of the run affixes permanent value to the mine. Sunnyside is a new dietrict, but hound to jump at once into a gold-producing center of considerahle importance. The Milwaukee and Geneva minee alone wonld make a rich camp. —*Boulder (Col.) News.*

Cloverdale Quicksilver Mine.—In this mine, situated in Sonoma county, at the junction of Squaw and Sulphur oreeks, Supt. Hall hae 50 men now employed grading the ground for the furnace and rednction works, and in putting up a large hotel and other huildings. The company have contracted for 400 corde of wood, to he delivered hy the 1st of Novemher, when the reduction works will he ready for operation. They have 300 tons of ore on the dump, ready for reduction. A nnmber of partiee interested in this mine are residents of Lake county.—*Lake County Bee.*

Lewiston.—The Helena *Independent* eaye: Mr. C. E. Kemp arrived from Lewiston, Sunday evening with over seventy pounds of silver. The Lewiston mill has suepended operatione for the purpose of enlarging its capacity, new and larger harrels replecing the old ones. Mr. Kemp has ordered from New Haven a Blake's crusher, to be used in his sampling and orushing works, which are aoon to be erected.

Pennsylvania Coal Mines.—All of the coal companies doing business around and in the Wyoming and Lackawanua valleya have stopped work, the market being overstocked. They expect to resume by September Ist. About 20,000 men and boys will have no employment during suspension.

Pine Flat Quicksilver Mines.

A correspondent of the Napa *Register* seys: The Sonoma mine haa a 20-ton furnace running, and is turning out abont 40 flasks per month. Mr. Edward Clark is superintendent at the famous Rattlesnake. It was surprising to see the vast amount of work that has been done, auch as building roads, erecting furnaoes, building houses, offices, etc. Rich ore has been struck in the lower or third tunnel, and the furnece will be ready for operation in a few days. The Missouri has two little retorts which are yielding ahout six flasks a week. The old superintendent, Mr. John Hsms, has been relieved, and A. Watters put in his stead. Rioh rock has heen found in a new spot, and there is no doubt hut that the main deposit of ore bas heen found at last. The Lost Ledge is proving itself to he the chief mine in the district, having yielded as high as 24 flasks per week, from one hench of three retorts, and they have an immense amount of ore in sight—enough to run their retorts for one year. The Kentuck is turning out a fine lot of ore, whioh ie being hauled to the Missouri for retorting. The company that owne theee two minee hae somewhat curtailed its expensee hy diecherging a large force of men; yet, with the present arrangement, they seem to be getting six flasks with ten men, while with 40 men they got no silver. The Flagstaft is surprising the most sanguine, having struck a rich ledge in the lower tunnel, and after going into the ledge for I2 feet it seems to be one solid mass of cinnabar, intermixed with native eilver. At the Brandt mine the ledge has been etruck, and they are taking out some good ore. The Georgia has an immenee amount of ore on the dumps, and more ie being taken out every day. Thompson Brothers & Reynolds contemplate erecting a furnace at the mine this fall.

From Tybo.—The furnaoe of the Tybo Consolidated company has been oompleted and was started up yesterday. The condition of the mines in the district is most encouraging. Work on the 2 G mine is progressing favorably and it is looked upon as the most important in the district. There ie still a scarcity of lumber, and building is consequently retarded. A large amount of machinery ie arriving, to be used at the mines. A number of families have arrived and taken up their residence in the new town. J. B. McGee is meeting with great euccess in his various nndertakings, and is now being well rewarded for his efforts to make whet the place promises to be, one of the important mining distriots of eastern Nevada. —*Eureka Sentinel.*

Frazer & Co., on Willow creek, Deer Lodge county, have one of the heet mining claims in the Territory. It has paid about $25 per day to the hand all season, hut having put in improved hydraulics and constructed new ditohee, they can safely rely upon taking out $30 a day to the man in the future. What givee this mine so much importance is the fact that no other water can he brought upon the ground and the company have about three milee of a gulch that prospects as well as where they are now working. They cannot work out the ground in twenty years. We do not know of a more deserving man than Mr. Frazer, and we rejoice that he has found a good mine at laet. —*Helena Independent.*

Foundry Improvement.—The old building for eo many yeare covering and surrounding the basis of operation of the Gold Hill fonndry has heen removed, and a large, commodious and appropriate building is now heing ereoted in its etead. The Gold Hill foundry is one of tbe most useful institutions in the country, having turued out eome of the very largest, heaviest and moet meritorious castinge ever executed this side of the Sierra Nevada monntaine. The estahlishment ie nnder the hest and most competent mauagement, employing none but the hest ekilled workmen, and conseqnently always turne ont the finest work. —*Gold Hill News.*

Caribou Determined to be Ahead.—The finest epecimen of silver ore ever produced in Colorado is now heing carefully detached from its position in one of the Caribou minee. It is eight feet long, four feet wide, and I5 inches in thickness; its weight ie estimated at four tone at least, and it is covered with nuggets and scales of pure native eilver, some of which, as an eye-witness observes, are large enough for door plates. The proprietors intend to exhibit their specimen at the coming Territorial faire, after which they will ehip it to New York, where it will remain until 1876, when it will be taken to Philadelphia to be on exhihition at the celehration of the Centennial.—*Denver Tribune.*

It is now becoming evident, says the Elko *Independent*, that the gold belt intereecting Idaho and Montana, contrary to established opinion, extends as far eonth ae the northern part of this county, and if present indicatione can he relied upon, exteneive gold fields will be found in that seotion. A number of partiee who have arrived from the northern gold regions of Elko county, pronounce the country very eimilar in character to that of Montana, and express a firm helief in the existence of rich placer minee heretofore unsnspected.

Kuder & Co. have struck fine gravel in their mine, at Saddle-Back, Sierra conty. They raised a shaft fifty feet from their tunnel and tapped a fine-looking hed of river houlders and washed gravel. They think they are on the rim of the channel only.

Colorado Coal.

In a recent issue of the Colorado Springs *Gazette*, we find some interesting details of an exploring expedition recently made by the *Gazette* editor, in company with Prof. Hayden, into the coal beds near Colorado Springs. The *Gazette* says:

It is manifest that the supply may be reckoned by the millions of tons, the croppings having been traced for upwards of three miles, and drifts and tunnels having been run in upon the lowest and principal vein fully that distance apart. Three veins have been discovered. The first is comparatively unimportant. The second averages about six feet in thickness; on this a tunnel has been run in for over three hundred feet, and a shaft has also been sunk to it. The third vein is from eight to nine feet thick; a shaft has also been sunk to this vein, and, as the quality of the coal in it is superior to that in the other veins, and it is altogether free from "dead matter," it is proposed to work the third vein during the coming winter.

After a careful examination of the ground, and the whole of the openings which have been made, Prof. Hayden said there could be no doubt that the coal corresponded with the Marshall coal in the North, and the Cañon City coal in the South, and he thought it not improbable that, as it was developed, it would equal in quality the latter. He had no idea that such an extensive coal-field existed in this part of Colorado, and thought its discovery was of the greatest importance. The quality of the coal, he said, is fully equal to that of the Evanston coal, which supplies the Union Pacific railway and the whole of the Pacific slope; and he was of the opinion that its existence, in the position which it occupies, must certainly, ere long, bring to Colorado Springs an Eastern railway connection, for the K. P. must, without doubt, go somewhere for coal.

Quick Work.

A correspondent of the Amador *Ledger* writes to that paper of an experiment recently made at the Phœnix mine. He says: At seven o'clock A. M., at the south, or old shaft, they started to see how many tubs of rock, each holding eight hundred pounds, could be hoisted in five hours with the regular set of hands, from the 700-foot level. Shortly after starting, the exhaust escape pipe bursted, necessitating a stop of 20 minutes. At precisely 12 o'clock the engine was stopped, after hoisting 226 buckets, or 90 tons and 800 pounds in four hours and 40 minutes. Two car men and a bucket filler were all that were employed at the bottom; two car men and one bucket tender on top put the rock in the mill. "Pretty good work," everyone will say—is that all it is? Figure a minute, and see. The engine must be stopped and reversed twice, for each bucket hoisted, (452 times). A good many stops and starts to make in 280 minutes. Again the buckets traveled up and down 1,400 feet for each bucket landed. Now, just multiply that distance by the number of buckets hoisted and divide by 5,280, the number of feet in a mile, and you find the buckets traveled a distance of just 400 feet less then 60 miles in four hours and 40 minutes. Is there another mine in the State, hoisting with buckets, that can equal it? Or is there another miner can equal Humphrey Reese in preparing a mine for such work? Or an engineer that can equal Dick Taylor in handling an engine? If there is let us know it. There are men here who say it cannot be beaten at any other mine or by any other crew.

THE NEW MILL.—The foundation for the battery blocks of the Consolidated Virginia mining company's new mill is completed, and in a few days the blocks will be put in place. The boilers, eight in number, together with the steam-drums and smokestacks, are on the ground and ready to be set up. The new engine, which will drive all the machinery, is the largest in the State, being 500-horse power. —*Chronicle.*

FROM COAL TO WOOD.—Heretofore the railroad company have been using coal instead of wood on their locomotives running between Truckee, Wadsworth and Winnemucca. They have come to the conclusion that wood is more economical, and hereafter will use that article. This arrangement will increase the consumption of wood somewhat and the additional supplies will be drawn from this region—*Truckee Republican.*

ASPHALTUM.—The San Luis Obispo *Tribune* states that an asphaltum mine has been discovered, and is now in successful operation, on a tract of land recently sold by the Steele brothers to a party of Frenchmen. Large quantities have been taken out, and it is pronounced by experts to be of the best quality. A contract has been made with a party for the hauling of fifty tons to the landing, to be shipped to San Francisco.

DANGER OF FIREWORKS.—A remarkable instance of spontaneous combustion which may occur at an ordinary summer temperature, say of 78 to 84 degs., is that of a mixture of chlorate of potash and sulphur; and consequently also of matches containing those substances, and also of red and green fire, which contain chlorate of potash and sulphur.

THERE are two hundred miners in the Panamint District, Inyo county, and one ten-stamp mill is running.

The Bruneau Mines.

Those who are rushing to the new placer mines in the Bruneau mountains, about which there is so much talk in some quarters at the present time, are not likely to find a new El Dorado. We have known of the existence of these diggings for two or three months through A. J. Smith of this place, who visited the region early this spring and located a large amount of mining ground and all the water available for mining purposes. He heard of the diggings through men who were herding cattle in that region, and when he left here gave out that he was going to the Atlantic States; not wishing to be followed and watched. When Mr. Smith first visited the mines he thought well of them. He made locations of ground, water and all else that he thought of value and left two men to hold his claims. At that time there was a considerable amount of snow on the ground in many places, though not in the flats where the diggings were located. Mr. Smith and his partners dug several holes to the depth of four or five feet, and in all of these obtained very fine prospects from the surface down. The gold was tolerably heavy, and fine and bright in appearance. We were shown a sample of the dust by Mr. Smith when he came in from the mines, and published an item in regard to the discovery at the time, though without making known the whereabouts of the new diggings, as Mr. Smith did not want a rush to the place until he had his claims in shape and got to work on them. He had made arrangements for lumber for sluices, for a house and the like, and intended to start hydraulic works at once, but when he made his second visit to the mines he "weakened." He found that all the gold there was in the ground was in four or five feet of gravel near the surface. Under this came in a clay, in which not even a "color" could be raised. He sunk a number of shafts and always with the same result. On the surface, and down to the depth of three or four feet, pretty fair prospects could be obtained, but below that not a color.

Mr. Smith gave up the whole thing in disgust and returned to this city, where he has remained ever since, with no desire to return to the Bruneau diggings. When he returned after his second visit to the mines, Mr. Smith made a report on the diggings to parties in this city who were interested in the claims located, and all were satisfied that it would be of no use to bother further with them. Nothing more was thought of the matter here until of late, when wonderful stories of the richness of the Bruneau placer mines began to be circulated in the papers, many of whom spoke of the region as the new "El Dorado." Although Mr. Smith and his friends a short time since had possession of all the water in the region and all the mining ground they cared to locate, they do not feel at all disturbed by the reports now reaching them, as they know exactly just what the diggings are, and don't want any interest in them. Two or three Frenchmen have been working in the Bruneau mines for about two years, and have made small wages—$2 or $3 per day—and that is about as much as anybody can make in any diggings yet found in that country.—*Enterprise.*

LIQUID INDIA INK.—When India ink is kept in a liquid state it soon becomes worthless, from the fact that the gelatin which it contains decomposes. A little glycerine added acts as a preservative, and causes the ink to flow well. Too much glycerine will prevent the ink from drying, and in this case it is, of course, easily blotched or smeared.

TO REMOVE FUNGUS AND MOSS.—Hochberger recommends the use of petroleum to destroy fungoid growths on wood and stone. The green mold at once turns brown or black, and soon falls off after being moistened with petroleum.

A CORRESPONDENT writes from the San Juan country that the mines there are well worth working, but that a number of them are owned by people who don't want to work, and go away discouraged because they can't pick up the ore on the surface.

INVESTIGATIONS by Professor Lenbe, of Jena, on the action of pepsin in digestion, tend to show that it acts in just the same way as a ferment, and is itself indestructible during the process.

THE broken fly-wheel at the Belcher works has been replaced by a new wheel, and all is going on again as usual, as far as the working of the mine is concerned.

ROASTING COFFEE.—A new invention has for its object an improved mode of roasting coffee, and consists of means for roasting coffee by reflection of heat.

OWING to the failure of water, the Bald Mountain company, Sierra county, have commenced paying their hands in script, redeemable on or before March 1st, 1875.

FOUR or five large quartz ledges, yielding abundantly of fine gold, were discovered lately about forty miles east of Warren's diggings, Idaho.

PHILO HAVEN is reported to have struck very rich diggings at Gold lake, Sierra county, having taken out sixty or seventy ounces in three days last week.

FORTY-FIVE thousand dollars in cash will be distributed in premiums at the State Fair.

A LARGE additional force of Chinamen was employed last week to work on the new ditch in El Dorado county. The enterprise will be completed at the earliest possible moment.

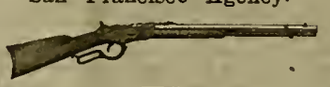
THE daily shipment of ore by rail, from the Comstock mines to the various mills on the Carson river, amounts at present to 1,800,000 pounds.

THE NEW WINCHESTER

REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.



The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.

The few compositions, which have won the confidence of mankind and become household words, among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the public about forty years, by a long continued series of marvelous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

assay of car samples has been increassd to from $100 to $150 per ton.

IMPERIAL-EMPIRE. — Driving the main sast drift, on the 2,000-ft. levsl is still making excsllsnt progress, ths rock in ths facs working quits soft. Sinking the sonth winze from ths 1,850-ft. level is also making good progress, the bottom still in fine ore.

GOULD & CURRY.—The face of the north drift, on the 1,700-ft. lsvel, is still ledge material.

SAVAGE.—The ssveral prospecting cross-cnts on ths 2,000-ft. levsl are still drivsn vigorously ahead, developing ssvsral bodies of low grads ore, but nothing that will yet pay for extraction.

BALTIMORE CONSOLIDATED.—Ths northwest prospecting drift, at the 450-ft. station, has been sxtsndsd 200 feet from the main shaft, in a portion of the mins hitherto nnprospectsd, and is showing some excellent ore indications.

SUCCOR.—Ths water is being drained from the Grant shaft preparatory to resuming the ainking of the shsft.

DAYTON.—The new machinsry is all in good running ordsr.

CALIFORNIA.—The north drift from the Virginia Consolidated on the 1,500-ft. level is in 174 ft. ths face in porphyry. The north drift on the 1,400-ft. level is in 140 ft., the face in very favorable matsrial for good progrsss. Two drifts have bsen started, on corresponding levels from the Ophir, to connsct with these drifts and thus secure thorough ventilation.

AMERICAN FLAT.—The main southwest drift on the 750-ft. lsvel is still pressed vigoronsly ahead This drift is running nearly parallel with the course of the ledgs, and will be run cousiderably frnthsr before cross-cntting the ore vein will be commencsd.

LEO.—The north drift looks fiuely and is yielding some rich ore. Stoping will be soon resumed at this point. Assays run as high as $400 to the ton. Lsdge from 5 to 7 ft. wide.

NEW YORK.—Whils sinking the shaft during the past week a fine vein of quartz, carrying some gold ors, was enconntsred. The main west drift at the 600-ft. level, also, has cnt a strsak of fine ore.

DANEY.—The indications are growing more favorable for a near approach to the maiu ledge. The drift is now in 250 ft.

JURTIOE.—Sinking the Waller shaft, the bottom of whioh is still in good ore, is making steady progress. The work on the new hoisting machinsry is rapidly approaching completion. Daily yield, 50 tons of ore.

SILVER HILL.—The ore body recently developed in the north drift on the 200-ft. level has greatly improved, and is now being extracted for milling.

OVERMAN.—The maiu north drift on the 1,400-ft. level is steadily advancing, following the fine streak of ore recently encountered, which, if anything, is showing a slight improvement.

CHOLLAR-POTOSI. — Prospecting operstions ars again fully resnmed in the Belvidere portion of the mins. Daily yield, 100 tons of ore, the assay value of which is $33 per ton.

GLOBE CONSOLIDATED.—The ore development in the west drift from the bottom of the winze at the head of the incline is proving valuable.

UTAH.—The flow of water is atill too great to admit of a resumption of the work of sinking the shaft.

BUCKEYE.—The main sonth drift ou the third station level is still driven vigoronaly ahead, the face in a brown-colored quartz that gives assays of from $12 to $30 per ton.

JULIA.—The work on the new machinery is making good progress. Most of the machinery has been shipped and is now on the road from San Francisco.

CALEDONIA.—Sinking the maiu shaft ia making excellent progress, the rock in the bottom working quite soft. It is now down 150 ft. below the 800-ft. level.

YELLOW JACKET.—The main east drift on the 1,740-ft, level is in a distance of 210 ft. in fair running gronnd.

PICTOU.—The rock in the face of the tnnnel worka well. Fine looking stringers of quartz continue coming in at the face. No water.

ORIGINAL GOLD HILL.—Drifting west for the ledge at the 320-ft. level is actively commenced, aud good developments are confidently looked for Water tronblea very little.

KOSSUTH.—The new machinery is all in complete runniug order.

OCCIDENTAL.—The ore developmeuts below the tunnel level are of a much more favorable character.

ROBINSON DISTRICT.

WARD-ELLIS.— White Pine *News*, Aug. 29: We still ooutinue to hear the most encouraging acconnts from our neighboring camp of Mineral city, the furuace being still in full blast, with every prospect of its continuing to rnn out quautities of bullion. The spirits of all are perceptibly higher than ever before in that camp. The new incorporatiou of the Ward-Ellis Mining Co'a valuable ground has been productive of bringiug that company into notoriety, aud work is being pushed more energetically on the locations. The ores now being extracted will go from $40 to $50 in silver, and carry 40 per cent. lead. This, taking into consideration the immeuse quautitiea of ore in sight, makes it a matter beyond donbt that the long struggles of the superintendent to make this company a success have been rewarded.

EUREKA DISTRICT.

EUREKA CONSOLIDATED.—*Sentinel*, Aug. 26: The prospects of this company were never brighter. At the greatest depth attained by any company on Ruby Hill—to-wit, 520 feet—the Consolidatsd has a four-foot lsdge of splendid ors, averaging in gold $116 per ton, silver $30, and 52 per cent. lead. This is an encouraging item of news, showing most conclusively that our mines have not only depth, bnt grow richer as they go down. The Consolidated has started bnt one furnace since the flood. The others will go into operation as soon as connsction can be made with the fume arrsster now in processs of construction. The iron for the flue is expected to arrive within the next 10 days.

THE K K.—Ths mines of this company sre bsing worked with the usual vigor, and all of the varions levels are looking as well if not bettar than ever bsfore.

RUBY CONSOLIDATED.—The new hoisting machinery of the Ruby will bs in place before ths closs of ths week. Work in the minss of the company is to be resnmed in a day or two on a comprehensive scale.

THE RICHMOND is still closed to the ontside world, thongh we are creditably informsd that the main workings are showing magnificently in ore of excellent grade.

PIONEER CONSOLIDATED—Work in this mine was somewhat ioterrupted during the last two dsys, owing to foul air setting in the main shaft. This obstacle has, howsver, been ovsrcome, and work is now progressing as usual. The shaft is down 85 feet, at which point a rich and apparently extensivs strike has been made.

BULLION PRONUCT.—The yield of the furnacss for the past week was as follows : Richmond, 300,000 pouuds ; Eureka Consolidated, (one furnace) 73,000 pounds; Hoosac, (one furnacs) 100,000 pounds; K K, (one furnace) 75,000 ponnds. Total, 548,000 pounds.

BULLION SHIPMENTS. — Following are the shipments : Richmond, 220,500 pounds; Eureka Consolidated, 65,710 ponnds; K K, 92,000 pounds ; Hoosac, 40,140 pounds. Total, 418,350 pounds.

PROFESSOR DAVIDSON, in charge of the expsdition to observe the transit of Venns, at Nagasaki, lsft this city last week for Japan. He is accompanied by O. H. Titman and W. S. Edwards, of the Uuited States Coast Survey, assistant astronomers; S. R. Seibert, Uoited States Treasury Department, chief photographer; H. E lertou Dodge, of Boston, first assistant photographer; Francis H. Williams, of Boston, secoud assistant photographer.

SOUNDINGS IN THE PACIFIC.—The "Tuscarora," George E. Belknap, commander, has returned to this port, having bean about a year on her sounding expedition batween this place and Japan. During that time she has run 14,000 miles of soundings. The greatest depth of water found was 4,655 fathoms, or 5¼ miles. This is the greatest authentic depth yet sounded. The greatest depth found ou the line finally surveyed was 4,037 fathoms.

NATE WEBB has showu the Truckee *Republican* an ingenious contrivance for raising ous end of a car ou or off the track, as may be desired. It consists of a nnmber of amall iron windlasses geared to the nsual platform-car derrick. By means of thia oontrivance ono man can in a few seconds raise the end of a car up several feet. For wrecking purposes the invention or contrivance is invalnable.

ONE of the most intsresting features of the Fair is the operation of the fine new Potter printing press in the center of the Pavilion, at work almost at all hours on the FAIR DAILY, a large eight-page free paper, published by Dewey & Co., of the MINING AND SCIENTIFIC PRESS. It furuishes a large amount of spicy and editorial matter aud miscellany.—*Oakland Tribune.*

THE Industrial Exhibition at Cincinnati waa opened on tbe 2d inst., and it was made the occasion of a general holiday, business being nearly suspended. The Board of Trade closed and the streets were decorated. The exhibition promises to far exceed auy previons one. The attendance at the opeuing was not less than 40,000.

SUTTER FORT.—C. Sweeuey and family have leased Sutter's Fort, and turned the old fortificatiou into a chicken ranch. The California Pioneers ought to have bonght this memorable place, enclosed it and kept it as a shrine for occasional pilgrimages.

THE MCGLEW FURNACE.—This furnace is doiug its work in good shape, roasting 10 tons, capacity of the mill, per day; at a cost of two dollars per ton, bnrning only two oords of wood in 24 honrs. Ore at the mill can be worked at seven dollars per ton.—*Alpine Chronicle.*

MINING machinery for the hoisting works of the Raymond & Ely mines is arriving at Toano daily, and is beiug shipped from there by ox teams to Pioche.

CLOUGH & Co. will immediately proceed to build a five-atamp mill on tbeir ledge, near Rock creek, Sierra county. They intend to have it runniug before winter.

THE Mansfield gold mine, near St. Lanrencebnrg, El Dorado county, is improviug. Negotiations are in progress for the erection of a mill.

MINING operationa in Independence gulch, Moutana, have been suspended for the season, on acconnt of the failure of water.

The Crouch Steam Engine.

This engine, which has been placsd in the boiler-shed, outside of the Pavilion, is quite a novelty in its way, and has attractsd considerable attention from mechanical engineers, both in this State and at the East. It is a California, or rather an Oregon, invention. The inventor is Master Frank A. Crouch, an Oregon boy, who was bnt 17 years of age when he first brought out his inventiou, about two years ago.

The principle upon which the invention is based is that of working steam supsr-heatsd, and its novelty is found in the mode of superheating. Snper-heated steam has heretofore been used in steam cylinders ; but it has always bsen super-heated in an iutermediate heater between the boiler and the engine, and introduced into ths cylinder in a highly heated condition, while the cyliuder was at a much lower temperature. While much better results were obtained in this way than in using steam at ordinary temperatures, the conditions were such that the cylinder and piston were soon destroyed by the excssssive wearing away of the iron, which was softened by the excessive heat of the steam, while the heating coil rapidly succumbsd to the oxidizing influence to which it was subjectsd in the furnace. By Mr. Crouch's plan the cylinders themselves are kept at a higher temperature than the steam, and made to serve as snper-heaters, as well as cylinders ; giving also ths additional advantage of utilizing the explosive effects produced by the sudden expansion caused by super-heating at ths instant the expansion occurs.

In order to effect these results, Mr. Crouch employs two single-acting cylinders, the lower portions of which ars dropped down into the furnace, where they are exposed to the direct action of ths fire. By this arrangement ths wet steam, whsn admitted into the cylinder from the boiler, is iostantly snpsr-heated and converted into dry steam, by which a large amount of expansive foros is gaiued at a very small expenditure of heat ; and, as a consequence, lsss water and steam is required, thus greatly economizing boilerspace. The cylenders of this engine ars open at the upper end like those of the ordinsry hot air engines, and the piston is forcsd back by atmosphsric pressnre.

Hitherto evsry attempt at workiug superhsated steam seems to have failed mainly from the mechsnical difficulties incident to handling steam at extremely high temperatures. While this may, to a large extsnt, bs avoidsd, as shown above, is it not possible that a more moderate degres of supsr-heating than that hitherto employed might be made practical ? Inventors are apt, by sndeavoring to do too much, to become discouraged by failures, which wonld have proved snccesses had they besn contented with more moderate achievements.

In the experiments thns far made with the Cronch engine, we have not heard of any attempts at working steam very highly super-heated; its proprietors thns far aeem to have been satisfied with moderate successes, slowly achieved. This conrse ia the snrest road to nltimate success. This invention, if it can be made practical, must certainly become an important advance step in reaching the ultimate point of economy in the generation and employment of steam. Sufficient time, however, has not yet elapsed to fnlly test the invention, and, so far as we have learned, it has not yet been snbjected to auything like a crucial test in the matter of super-heating for heavy work.

This, we believe, is the first time the invention has been placed on pnblic exhibition, althongh the machine now exhibited is the tenth which has been constrncted. One of the engines has been running nearly a year in the San Jose foundry, and, as we understand, without any appearance of deterioration in the cylinder, or any other part; but we are not advised as to the amount of work it has had to perform.

HEAVY SHIPMENTS.—For the past few days, the amonnt of ore shipped by rsil from the Comstock mines to the variona mills in the vicinity, has averaged 90 car-loads per day.

THE Sonoma quicksilver mine, np to a few days ago, had shipped $25,000 worth of qnicksilver since the starting of the fnrnace last January.

THE "Nantilns" haa returned from the expedition to the "gold island," in the North Pacific, but without any bullion or ore.

THE frame of the Consolidated Virginia Mining Company's new mill is ready to be raised.

THE Central coal company, Contra Costa connty, is taking out from 75 to 100 tons of coal per day.

Two thousand tons of steel raila are being laid on the monntain portion of the Central Pacific.

TIMBER is becoming scarce in the vicinity of Nevada City and Grass Valley.

SINCE the first of April 15,000 immigrants have arrived from the East hy rail.

A COMPANY haa been formed in Buffalo, N. Y., to put a railway tnnnel nnder Niagara.

A NEW sst of timbsrs is being made for the Yellow Jacket hoisting works.

A RICH strike has been made in the Silver Lake mine, nsar Dayton.

AN slevated single-rail railway is to bs put np in this city.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Sept. 1st, 1874.

FOR WEEK ENDING AUG. 18TH, 1874."

SPRING FOR VEHICLES.—John Smith, San Francisco, Cal.

TAP AND FAUCET.—Michasl Kreiss, Redwood City, Cal.

GAUGE WHEEL FOR GANG PLOWS AND CULTIVATORS.—Don Carlos Mattison, and Truman P. Williamson, Stockton, Cal.

HAY AND COTTON PRESS.—Evilee T. Armstrong, Baker City, Oregon.

PAPER STOCK.—George B. Walker, Placsrville, Cal.

———"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issne.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Mining and Scientific Press,

(Established in 1860.)

The oldest, largest and best Mining Journal. Devoted, also, to Science, Invention, Mechanic Arts and Industry on the Pacific Coast.

Subscription to the above, $4 a year; Sample Copies, post paid, 10 cts.—four for 25 cts. Address,

DEWEY & CO., Publishers.
No. 224 Sansome st., S. F.

FOR STATE OF NEVADA.—We have appointed Mr. F. B. Alderson our special agent and correspondent for the State of Nevada. He will visit our friends and patrons there soon.

CAMPO, SAN DIEGO Co., CAL., July 3d, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It conteins 142 pages, embracing illnstrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Snlphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illnstrating machinery, etc., which alone are of the greatest valne. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth, $6 in leather, coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.,

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, Brazil, Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventious already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventious and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, bnt their inventions also, from this canse and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast haa been donc, and is still being done, throngh our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the valne and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmit ting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulara free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circnlar and other printed illuatrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rnral Press, 224 Sansome St., S. F.

METALS.

WEDNESDAY M., Sept. 2, 1874.

There is nothing new to report of the Metal market. Quicksilver is firm; Iron, Steel and Tin Plates in slightly better demand; Lead slow of sale.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applicetione.]

Conteining a sizing apparatns, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resnlting in the simultaneous continual delivery of separated materials, working 2d end 3d-class ores into 1st-class ores of perfect cleanness. It thoronghly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, haryta and quariz; and pyrites from quartz.

Addition to the story of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.

At Denver, Colorsdo. Look-Box 2225, or 243 Sixteenth street. ag8-16p

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore.

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

ap25-tf

BALL'S
SWEEPING DREDGE,

A NEW AND VALUABLE
CALIFORNIA INVENTION,
Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scowe and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patente unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Improved Cast and Forged

STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into nse in all of the principal mills on this coast.

Their advantages over iron are obeapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

OAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pnlverizing and amalgamating orss, they have no eqnal. No effort has been, or will be spared to hava them constructed in the most parfect manner and of the great number now in operation, not one has ever required repairs. The constant and inorsasing demand for them is sufficient evidence of their merits.

They ars constructed so as to apply steam dirsctly into tha pulp, or with steam bottoms, as dssired.

This Amalgamator Opsratss as Follows.

The pan being filled, tha motion of the mnller forces tha pulp to tha center, where it is drawn down through tha apperture and between tha grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, whers it psses down, and to the circumference as befors. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until tha ors is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfactly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

VOLUME XXIX Number 11.

The Old "Soggs" Mine.

A company was incorporated in this city a short time since under the name of the Nevada Gold Quartz Mill and Mining Company, to work the Nevada Quartz or Old Soggs mine, from which over a million dollars were taken before the present owners took possession of it. This mine is situated on Deer creek, Nevada county, California, and has quite an eventful history. The mine, as located by Charles Marsh, E. E. Matteson and Dr. McIntyre, was 1,300 feet in length, and was turned over by the Bunker Hill company, as it was called, to Soggs and others, in 1851; and the water of Deer Creek and its tributaries was located and taken up and used April 1851, by Charles Marsh and others. It was worked about 2,000 feet from the present mill, and the ore crushed by a steam mill, with good results. Subsequently the Nevada company purchased 700 feet on the north end, being induced to do so from their having taken out some $40-rock from a tunnel run in on the Nevada. Subsequently the Nevada company purchased 1,000 feet of the old Bunker Hill ground, and also the water right. They put up the present mill, and from three tunnels run into the hill took out something over a million of dollars.

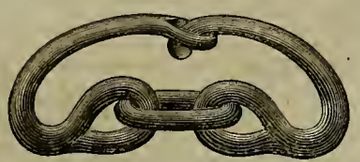
When the original Bunker Hill company failed in their work it was supposed that the mine was of no value, and was not worth accepting as a gift. As before remarked, however, after the ledge had been located further north and tried, it was found to be valuable. The mill put up by Soggs, Van Pelt & Green, for a half interest in the ledge, was run successfully for several years. They got money enough from the mine to buy out the other owners, and when it was known that the Bunker Hill was the same ledge, the mill site, water-wheel and flume of that company were purchased, and a new mill put up in 1860. About this time the company was incorporated as the Nevada Quartz Mining Company. Nelson Soggs was the superintendent from the time the first mill was built up to 1864, when he resigned, on account of ill health, but the mine is still known as the Soggs mine.

Up to date no cross-cuts have been made in the mine, and it is the general opinion that if this were done more rich discoveries would be made. Although a large ledge with ore averaging $20 per ton right through, the mine failed to pay after 1867, and was shut down until July, 1871, when John Berry, the present superintendent, took charge of it. He found the ground badly caved and the mine expensive to open. He began an incline near the mill, and at a depth of 80 feet found some promising ore. At 105 feet he started a level, and took out some fine ore, although some still remains. On this level there is a drift running north 90 feet, and one about the same length south. Ore has been taken from both drifts that was rich in fine gold and sulphurets.

Leaving this stand for future use, they commenced sinking, and at 217 feet opened a second level and ran a drift 124 feet south. Here the ledge was broken, but the walls were wide apart. Having a worn-out mill and poor hoisting works, the ore was left and a drift started north for the pay chute in the old mine. This drift is 630 feet long; the first 150 feet turned out some good ore and a large quantity of low grade ore, which will pay if assorted. In the face of this drift there is a promising looking ledge, fifteen feet thick, which is increasing in size and quality as the distance and ground correspond with the old works. It is believed that this is the foot of the old pay chutes. From this drift to the old lower tunnel, 227 feet, some of the ground has been stoped, and it is expected to furnish ore for the 15-stamp mill for several years. From the 217-foot level they have sunk 162 feet, the most of the way through a ledge varying from three to 10 feet, being seven feet at the bottom, with no permanent walls in sight. A drift north from this bottom level is still being worked in ore. The north side of the ground is broken, but carries good ore. This mine connects on the south with the Providence, in which mine they are working a body of ore varying from 25 to 40 feet in thickness. This body has pitched south between the 300 and 500-foot levels, but at the 600-foot level it is pitching north, which is the regular pitch of all the pay chutes on the ledge. It is expected that this will eventually run into the Nevada ground 200 feet deeper than the Nevada shaft is now run.

The old Nevada or Soggs mine, with all its vicissitudes of fortune, is now in a first-rate condition for work under the new company. Within the past two and a half years there have been put up on the creek a new stone dam, 1,200 ft. of new flume, etc. New hoisting works with hoisting and pumping machinery have also been put up. The mine has two good pumps. The machinery is run by a hurdy gurdy wheel and free water power, of which the company own the oldest right on the creek. Within the past two years, there have been put in operation 15 new stamps, two patent rubbers and six concentrators, all of first quality, and the mill will crush 30 tons of ore per day when running to its full capacity. The batteries are fed by self feeders with hoppers that hold eight tons each. Everything about the mill and mine is in good order. The mill is also run by a 32 foot overshot wheel.

The Providence mine, adjoining the Nevada, is valued at half a million. It has a 20-stamp mill and is now adding ten stamps more, which will make it as large as the mill on the Idaho. The Wyoming near by has a six-stamp mill and is adding 10 stamps more, making 16. All these mills are within a radius of an eighth of a mile, making 61 stamps, all run by water power. The yield of the Nevada mine for the first nine days of last month was $2,232.75 or $249 per day, so the old mine is beginning to recover its position as a producer. The company have paid out $60,000 since 1861 for labor and machinery, the mine paying nearly all its ex-



Quinlan's Chain Connector.

penses. Nevada City is said to be more prosperous to-day than she has been in any past time.

Immense Real Estate Sale.—The large amount of real estate recently deeded by Mr. James Lick, of this city, for charitable, educational, scientific and public purposes, is advertised for sale by the trustees on the 17th of November next. The property including the Lick House lot and other real estate in this city, Island De Santa Catalina off Wilmington harbor, and Mr. Lick's landed interests in Santa Clara and Los Angeles counties and Virginia City, will be sold at auction by Maurice Dore. The terms proposed are one-quarter cash, one-quarter every succeeding year until the property is paid for, deferred payments to bear interest at eight per cent. per annum. The sale is ordered with a view to speedily carrying out the bequests of Mr. Lick.

The Cahill quartz ledge, in Baker county, Oregon, was discovered on the 29th of April last, and in June Mr. Cahill commenced taking out rock, and since that time $60,000 worth of rock has been taken out, and there is now, at the lowest calculation, $150,000 worth of rock in sight. This ledge is about 70 miles distant from Baker city, and 30 miles from Canon city.

A large body of hot water was struck in the 1,465-foot level of the Consolidated Virginia mine, on Saturday last. From this level a drift extends into the Gould & Curry, with a downward slope, and the water runs into the latter mine. The Gould & Curry pump is a foot in diameter, and it requires its utmost capacity to control the water.

Considerable excitement exists concerning coal mines in Palmyra district and El Dorado canon, which have recently developed favorably, and new locations are being constantly made. The coal is of an excellent quality, and has been tested in furnaces with satisfactory results. In some places the stratum is over six feet thick, and is solid and well defined.

Mending Cracked Bells.

Daniel L. Riggs, of Salem, Oregon, has recently invented a process for mending cracked or broken bells, which is rather ingenious. The fracture in the bell is mended in such a manner that the brass is homogenous throughout, and the tone of the bell is preserved. Metals have heretofore been soldered or turned together in mending bells, but these means have failed to make the brass homogenous, and the tone of the bell is destroyed.

The arrangement by which the bell may be mended may be seen by referring to the engraving.

A is the cracked bell, to the outside of which the inventor molds from plumbago and fire-clay, or any suitable substance, a frame, *C*, which passes around each side of the bell, and has a chamber, the center of which is contiguous to the crack. Inside of the bell is constructed a combined furnace and mold, *C* and *B*, which has a diaphragm passing across the bell, and making the furnace-chamber. Commencing at the top of the crack and extending to its bottom is made a mold, *B*, in the curved side of the furnace, the opposite side of the

Device for Mending Broken Bells.

mold being formed by the convex side of furnace, *C*, which bears against the outside of the bell. *E* are clamps which fasten the two parts of the mold to the cracked bell.

The operation is as follows: The furnace-chambers, *C*, *C*, being supplied with fuel and ignited, a blast is thrown on them until the edges of the crack are fused and united, the deficient metal being supplied by other metal already melted and prepared, poured into the mold, *B*.

This method is simple, while at the same time it is ingenious. By this process the old cracked Liberty bell, on Independence Hall, Philadelphia, can be made as good as new, so that it may be made to ring again in 1876, as it did in 1776.

Casting a Patch.—A master mechanic of Sacramento showed our correspondent "Athlesis" a piece of his handywork the other day which was of interest. He showed him how he had cast a patch into a broken locomotive cylinder. The cylinder would have been condemned to be broken up, the way of all old castings, but by the ingenuity of this mechanic it was made as good as new. By the method employed, which he refused to explain, broken castings can be made new again. It is well known that the Chinese have for centuries been in the habit of mending broken iron kettles, etc., by casting patches upon them when broken or worn so as to admit of such kind of repair; but we were not aware until informed as above that any civilized mechanic had been able to do such work. The ingenious Sacramento mechanic should either patent his invention or make the modus operandi known for the benefit of the world. In another articles of this issue we illustrate a process for mending cracked bells so as to restore perfectly the original tone and quality.

The Silver City Miners' Union has elected the following officers for the ensuing six months: president, O. H. Roussand; vice-president, H. A. Savage; recording secretary, E. S. Ross; financial secretary, P. Dorenburger; warden, N. Marcille; conductor, Joseph Marcille.

Tripartite Chain Connector.

The accompanying cut represents a tripartite tie link for chains, recently patented through the Mining and Scientific Press Patent Agency, by William Quinlan, of Mayfield, Santa Clara county, California. The link is so constructed that it can be used for connecting any two links of a chain in almost an instant, so as to unite two or more chains into one continuous chain, or repair a broken one. The construction of the link is easily seen by referring to the cut. The flattened, arrow-shaped bead of one of the U-shaped links fits into an oval, elliptical or other shaped ring, through which it is passed in the manner of an interlocking buckle, in order to connect the ends together. This makes a perfectly regular or even exterior on which there are no projecting points to catch or drag, the ends being turned to the inside of the link.

Thus the link can be made of any desired size, so as to correspond with the links of a chain of any size. These chain connectors will be a great convenience to teamsters and drivers, as they can mend a chain in a moment in the dark, so as to render it equally as serviceable as before it was broken. The link also serves as a coupling in many places, thus placing in the hands of lumbermen, teamsters, millers, carmen and others, a real yet serviceable, useful and convenient implement. To connect the links of a chain, or two separate chains together, the arrow-shaped bead is disengaged from the ring so as to open the link and allow the arms of the U-shaped rods or bars to swing apart. The end links of the chains are then hooked into the U-shaped rods, and the ends of the rods are buckled or linked together, so that the tie link will form one of the links of the chain, and unite the ordinary closed links, thus repairing or connecting the chains or pieces of chain. It will be noticed that by bending the ends of the long arm of the U-shaped rods inward toward the link in the middle, a partition is formed which prevents the links from changing ends or getting entangled, while it permits the link to pass through any opening, or over a pulley, through or over which the ordinary chain links will pass. This link can be used for many other purposes, such as a tug attachment to singletrees, clips and for other similar fastenings.

Hiram G. Bloomer, Director of the Museum of the California Academy of Sciences, died suddenly in this city on Tuesday last. Mr. Bloomer was well known as an enthusiastic botanist, having resided in this city since 1852, and paying a large share of attention to his favorite study among the flora of this coast. He has contributed many valuable papers to the proceedings of the California Academy of Sciences, of which Society he was an old and prominent member. He was with the Academy in its dark days, and for the past few months has been laying plans for appropriately displaying the large botanical collection belonging to the Society, which its better fortunes would allow him to do. Mr. Bloomer has been Director of the Museum for several years, and filled his position to the satisfaction of all. He leaves a wide circle of friends, among whom his memory will be held in grateful remembrance.

The Saucelito Marine Railway, Tug and Water Co., will soon be incorporated, with a capital of $400,000, to build and maintain marine railways, run tug boats and supply water to vessels and others, transport and sell water, carry freight and passengers by water vessels, carry on the business of wharfing, docking, the construction of bridges, ferries, wharves, chutes, piers, marine railways, tag-boats, and to construct, build and use dry docks, warehouses and machine shops.

The directors of the Olive copper mining company, near Healdsburg, have decided to resume work on the mine immediately. In 1865 less than two tons of ore from this mine, shipped to New York, yielded 28¾ per cent. and brought $360.93 gross. In the same year 112 sacks, sent to Swansea, England, netted $608.10.

Industrial Fairs—Exhibitions of the Mechanics' Institute.

The following article, containing many historical and other interesting facts, is copied from the San Francisco *Journal of Commerce:*

Fairs have been the earliest mediums of commerce, and are much more common in the Old World than in the New. Through their means in olden days, the people of widely separated districts met and exchanged their respective products, thus laying the foundation of the vast commercial system which has given a tone and a manner to the whole of modern life. For long ages these fairs were held, growing yearly in importance till in what are now denominated the middle ages, the attendance at some of them might be numbered by hundreds of thousands.

During the last three-quarters of a century, however, fairs in Europe have begun to die out, and to day show nothing of their old time importance save perhaps at Leipsic and Novogorod. In Central Asia, particularly in that portion which forms part of the Chinese Empire, the fairs present somewhat of the appearance that they did in Europe in the middle ages.

To fairs and to the knowledge and information imparted through their medium the human race owes a great deal of its civilization—the accompanying games, contests and trials of skill helping to stimulate inquiry and research, and to give rise to invention. To them we owe the foundation of the theater, of the musical art, and literature itself—even the almost omnipresent if not omnipotent newspaper, being merely the successor to the story teller, to the bearer of news, and to the glorifier in prose or poetry of the attributes and the exploits of some favorite hero.

We have said that these fairs have been dying out for the last three-quarters of a century, we might almost have said for the last three centuries; but it has only been to revive again in

The Monster World Fairs

Inaugurated by the giant one at Greenwich. They embody all the characteristics of the ancient fairs, save those of buying and selling, people come together in them now solely to strive for the palm of excellence, leaving the mercantile part for other times and more appropriate places. Few of our readers have ever been fortunate enough to be present at the great world fairs, the meeting places of nations, but the majority are familiar with what has been done in San Francisco on a smaller scale. The managers of the Industrial Fairs here have not, as those of other lands, been enabled

To Wield the Resources of Vast Nations.

With the people at large the matter has not been one of national or sectional pride—they have had to struggle along a rough and weary road, often uncheered save by the consciousness of being engaged in a just and worthy cause, and one which they felt certain was sure eventually to triumph.

The Industrial Fairs of San Francisco owe their origin not to national or sectional efforts, but to the efforts of gentlemen connected with one of our most useful institutions, the Mechanics' Institute. And as so much of the success of the various Industrial Fairs has been owing to it, it may not be amiss to speak briefly of its origin in connection with the history of the movement that has culminated in the grand exhibition that we make the especial object of this notice.

Mechanics' Institutes had been successes in other quarters before the idea rose of founding one in San Francisco, though it is now so long since the first meeting for the organization of one was held in San Francisco, that it almost seems to belong to another age.

The First Move.

The first move to organize a Mechanics' Institute in this city was made in the latter part of 1854, by a meeting held in the office of the Tax Collector on December 11. At this meeting Mr. George K. Gluyas presided, and Mr. Roderick Mathewson acted as Secretary. Up to this time no successful attempt had been made to organize a society of mechanics; having for its object the establishment of a library, reading room, museum and other literary and scientific purposes, and excluding all political and religious matters.

But matters seemed to move rather slowly for it was only on 6th of March, 1855, that a committee appointed at the previous meeting, and consisting of Messrs. Benjamin Haywood, Roderick Mathewson, John S. Williams, E. T. Steen and Henry E. Carlton, reported a series of By-Laws and a Constitution, organizing the Mechanics' Institute, with a capital stock of $75,000, in shares of $25 each.

On the 29th of March, 1855, a permanent organization was effected, with Benjamin Haywood President; John Sime, Vice-President; J. W. Brooks, Treasurer; P. B. Dexter, Recording Secretary; Wm. M. La Roche, Corresponding Secretary; and the following Directors: Gardner Elliott, S. H. Williams, John C. Macredy, George Cofran, James Ballentine, Eli Cook and S. C. Bugbee.

On the 2d of July, same year, Messrs. La Roche, J. W. Brooks and S. C. Bugbee resigned, and in their places were elected Messrs. Henry F. Williams, Charles H. Gough and R. R. Williams.

On the 3d of October following, Mr. Haywood resigned as President, and Mr. John Sime became President, Mr. William McKibben being elected to fill the vacancy. We are thus minute in giving the names of the pioneers in the good work, as it is but right and fitting that our people should know who bore the brunt of the battle in the early days of the Institute.

The first annual report showed the total receipts of the year to have been $1,106.86; disbursements of the year to have been $1,085.37.

There were 487 volumes in the library. It is interesting to follow the history of this Institution from that time (1855), to the present, its struggle for existence and narrow escape from death, its pertinacity and energy, and, above all, its manly independence and freedom from doubtful pecuniary schemes, slowly fighting its way to its present important position, with a membership roll of 1,400 members, 25,000 books in its library—books of the rarest value to the mechanic and scientist—an annual income of $15,000, and owning the fine building it now occupies on Post street, above Montgomery.

In no way has the Mechanics' Institute so shown its usefulness to the industries and mechanic arts as in the Industrial Exhibitions held under its auspices. The primary object of holding such exhibitions as these was of course to raise funds for the Library, but one thing by degrees led on to another, until the movement reached its culminating point in the great series of expositions of the last two or three years.

On the 15th of December, 1856, a circular was issued by the Directors, signed by Mr. H. F. Williams, who was then Corresponding Secretary, announcing that an Industrial Fair would be held in this city in September 1857, and on the seventh of that month the Fair was opened in a building erected on the present site of the Lick House, which was some little distance from town, and not considered at that time very central. Mr. Henry F. Williams delivered the opening address, and Mr. Edward Pollock presented a poem.

We would like well to make a few extracts from both address and poem, but they would swell a newspaper article to too great a length.

The lot on which the Fair was held was the property of Mr. James Lick, who gave the Institute the free use of it. The building covered an area of 20,000 feet; the exhibition being held nineteen days; the total receipts being $22,374, a profit of $2,878.48 being cleared.

The names of the Managers were as follows: John Sime, Gardner Elliott, H. F. Williams, P. B. Dexter, J. E. Kincaid, Eli Cook, J. A. Banks, Isaac E. Davis, Wm. McKibben, C. L. Taylor, G. D. Street and Daniel Van Pelt, many of whom will be recognized by the present generation.

The second Fair was held in the same building as the first, and opened September 2, 1858, remaining open nineteen days. The receipts were $15,541.50; expenses, $13,569.43.

The third Fair was held in a frame building erected on the same lot as before; this did not prove a success, having run behind several thousand dollars. It opened in September, 1861, and took the society a number of years to wipe out the indebtedness incurred by the failure. Considering that they had been working so far for five years, and without result, it might have been expected that the holding of Industrial Fairs would have been abandoned. But no—

The Spirit of the Men was Indomitable.

The fourth Fair was held in a building erected on Union Square, having an area of 55,000 feet. The expense of erecting this building was met by a loan, without interest, made to the managers by liberal citizens of San Francisco, and which was repaid from the receipts of the Fair. The receipts were $41,579.55, and the disbursements were $38,737.64.

The fifth Fair was held in the same building as the preceeding one, opening on the 10th of August and closing on the 9th of September, 1865. The receipts were $32,133.25, and the expenses were $15,391.53. The success of this—netting nearly $17,000—was so marked that the managers were encouraged to attempt the holding of

A Monster Fair.

And so the sixth Fair was held in a new building erected on Union Square in 1868, having an area of 75,000 feet. It was opened on the 8th of August and closed on the 12th of September. The receipts were $58,402.83, the expenditures being $62,645.36. The building was much larger than any previous one, and the money for its construction was borrowed from the citizens of San Francisco without interest, and repaid from the receipts of the Fair. The opening address was delivered by Hon. Newton Booth. It was a success from every point of view save a pecuniary one, and the necessity of making up for the loss caused the holding of another Fair in the following year.

The seventh Fair, held in the same building as the sixth, opened on the 14th of September and closed on the 30th of October, 1869, area of building being increased to 87,000 feet. The total receipts were $70,701.06, and the total disbursements were $44,929.13.

The eighth Fair was also held in the same building, which had been enlarged to 100,000 feet, and was opened on the 8th of August and closed on the 7th of September, 1871. The total receipts were $62,846, and the total disbursements $30,991.91.

This Fair was held shortly before the great Chicago fire, and $1,000 was appropriated by the Institute to assist the sufferers.

The principal exhibits at these Fairs were of California manufacture; and, as a matter of interest, showing somewhat the progress in manufactures, we append a table of the size of each building, number of exhibitors at each Fair and the average space required by each exhibitor at the respective Fairs.

Date.....	1857	1858	1864	1865	1868	1869	1871
Area of Bld'ng	20000	25000	55000	61000	75000	87000	100000
No of Exhibitors	650	575	717	585	647	826	1020
Ft to Exhibitor.	31	43	77	104	111	105	98

The last item shows the increased importance of each exhibit, from the amount of space required. The Fairs of 1869 and 1871 being held in the same building as that of 1869, although increased in size, did not furnish sufficient room to meet the demands of the increased number of exhibitors.

The first Fair held by the Mechanics' Institute, demonstrated the fact that the seed had been sown that was to bear such good fruit to the manufacturing industries of this State, and that it only required such exhibitions as these to develop its natural resources. For instance, in the first Fair we find specimens of coal from Bellingham and Coos Bay, borax from Alkali (in Clear Lake), ores of gold and copper from California, of silver and copper from the Gadsden Purchase (Arizona), California made boots by Holcomb & Dole, paper by S. P. Taylor, crackers by Deeth & Starr, cordage by Tubbs & Co., cigars of native tobacco by I. Braverman, a silk winder by Ebenezer Smith, silkworms and specimens of silk by F. W. Jackson, specimens of beet root sugar by Eugene Delessert of San Jose, a sketch of Yosemite Valley by J. M. Hutchins. At this time California was not yet a producer—manufactures, it might be said, she had none, while the golden grain fields of the Sacramento and the San Joaquin valleys, the hundreds of green, grape covered slopes, and the millions of white wooled sheep grazing on a thousand hills, existed but in the imagination of the dreaming enthusiast. But the exhibits even at this early period in the history of the State gave

Promise of a Better Day,

And so we trace through each exhibition new branches of manufacture, newly discovered natural products, new arts, each containing an idea for something still newer, and awakening latent ideas or developing new ones in the brain of the observer and thinker; in fact each Fair forms a complete chapter in the history of local progress, and there can be no more valuable a channel of information to the people. It is an encyclopedia and advertisement combined into a kind of birds-eye directory.

The Sonora Company.

It was our pleasure this morning, says the San Diego *World*, to meet Colonel William Boyle, of London, England, who arrived in the city to-day on the "Orizaba," *en route* to Arizona. This gentleman represents the above named company in the capacity of Mining Engineer and Superintendent of the mines. A brief sketch of the objects of this powerful organization may be of interest: The Sonora company was incorporated for the purpose of working certain mineral estates in the Territory of Arizona and the adjoining State of Sonora, in Mexico.

The first property acquired by the company is the estate of Santa Rita, and other tracts, on the Santa Cruz river near the proposed line of the Texas and Pacific Railway. The mines on this property were known to the early Spaniards, and are spoken of by the Jesuit Fathers, and in Ward's "Mexico" as extremely rich. They were worked by an American company until the civil war and Indian depredations caused a suspension of operations.

The tract of land contains upwards of 100,000 acres, comprising 100 or more veins of ore, mostly silver and lead, with an average yield of more than $100 per ton.

The company has also purchased the celebrated estate of Arivaca, one of the most famous mining haciendas in Arizona or northern Mexico. This property comprises a valley of land surrounded by mineral mountains, and has the advantage of covering the only living water within a radius of 10 miles.

The mines attached to the Arivaca estate contain more refractory ores than those of Santa Rita; but this is compensated by the greater value of product, some of the ores having yielded £100 per ton, and the average for several years not having fallen below £50 per ton.

The company now purpose commencing operations immediately, and Col. Boyle feels gratified that the operations of the company will be principally carried on in the Territory of Arizona, it being preferable that all transactions be made under the jurisdiction of the United States government, having for protection the federal laws and courts.

Small Business.—The doorkeepers at the Mechanics' Institute Exhibition still continue to confiscate goodly numbers of season tickets. It seems strange that men who would scorn to come into the fraudulent possession of a half dollar in the ordinary course of things, should not scruple to attempt to cheat the managers of the Fair out of that sum by lending their ticket or borrowing one from somebody. Every effort that is made to get into the Pavilion on a season ticket not purchased by the person presenting it, shows that two people are willing to be dishonest at the small price of fifty cents for the pair. The number and respectability of the parties detected in this infinitesimal business is both laughable and melancholy. In most cases it is only with discovery that the meanness of their conduct flashes upon them. Not a few seem very glad to sacrifice the five dollar ticket for the privilege of getting out of the way in the shortest possible time. Others make the most ludicrous attempts to lie out of their difficulty, and in spite of the laughter and scorn of bystanders hang on to the remorseless doorkeeper until that enduring functionary loses all patience and threatens arrest. The astonishment of all at the inexplicable acuteness of the ticket taker is very funny. Never was there a more undignified position, and it is a mystery past understanding that a man with ordinary vanity, let alone self-respect, should subject himself to the possibility of such humiliation for the sake of saving four bits.

Quartz Mines of Washington and Eureka.

There at present but few mines working in these districts, but considerable prospecting is going on and ere long they will command the attention of capitalists and be sought after as they deserve.

At or a little below the town of Washington, we find Captain Miller, of the Dartmouth gravel mine in this place, opening up a new mine, which from reports promises well. The location is good, the ledge is large, and having a good water-power, the cost of mining and milling will be so small that a low average ore will pay.

On Diamond creek, the Comanche is working a small force with excellent prospects in shaft.

At the South Yuba, Messrs. Jones & Moore are getting in their winter supplies and repairing their mill and flume.

On the other ridge we find the Lindsay mine at work with a small force. They have a large ledge, which has the appearance of being excellent milling rock.

Farther down the river we come to Cañon creek, at the mouth of which is Cañon creek mine; a finely located property, having a prominent ledge cropping out boldly from the creek to the summit of the mountain, about 2,500 feet above. Mr. Samuel Locke, formerly of Grass Valley, has the management of this mine, and the developments consist in tunnels driven in on the ledge at five different levels, a distance of 100 or 250 feet, in all of which good pay ore is in sight; the ledge being from five to eight feet in thickness. They have as fine a ten-stamp gold mill as there is in the State, of which Mr. Samuel McCurdy, formerly of Gold Hill, Nevada, from whom we gathered many interesting facts about this enterprise, is superintendent. Connected with the property and making a part thereof, are a boarding house, office and other buildings; also 160 acres of choice timber and one of the best water powers in the State; capable of running 100 stamps. Taking into consideration the short length of time since work was begun here, they have accomplished wonders, and, as Mac. says, now don't need to care whether school keeps or not, as they have everything in shape for working to advantage.

Climbing to Gaston Ridge, the first mine we come to is the Treasury, owned by Messrs. Cowls and Maybank. They have sunk a shaft about 30 feet deep and thence drifted through their ledge, which is here about 20 feet wide and shows well in free gold and sulphurets. The claim is 1,500 feet long and the ledge is traceable the whole distance. A small lot sent below and worked by mill process paid $42.79 per ton.

Work is also being pushed on what is known as the old California or Gaston Ridge mine. They have recently cut through a ledge of very rich quartz some two feet wide, and we understand it is the intention of the owners to erect a mill this fall.

Next we pass to Eureka township, where the quartz interest is looking brighter than for some time past.

A short distance east of Grantiville is the Liberty mine, which we understand has just changed hands, and the new owners intend to thoroughly open it up. The quartz from this mine paid well from the surface down, a ledge from five to nine feet thick giving a mill average of from $12 to $19 per ton.

The old National is also being worked with very satisfactory results. A tunnel is driving in on the ledge about 100 feet lower down than it was ever before opened, and the quartz looks fine. This is one of the old mines of this district. Judge Walsh and Col. Raymond in 1855 built a 4-stamp mill on it, which was run very successfully for a number of years, the quartz paying $12 to $14 per ton. This mill was destroyed by fire in 1859, and the company being scattered, the mine lay idle until about two years ago, when it passed into the hands of Mr. Francis Henry, of Moore's Flat, who is now opening it up. This property is finely situated and can be worked very cheaply, as the right to 80 inches of water with 100-foot pressure, from one of the ditches, goes with it. We understand the owner has been offered, but refused, a considerable sum for this property.

The Republican, a first southerly extension of the National, has a large amount of quartz in sight which prospects well, and with other great advantages it does really seem strange that it is in a great measure lying idle. The main ledge is here 20 ft. thick, with large spurs putting in at intervals all along down the hill, from the hanging wall side. The general course of the ledge is nearly north and south, dip east and in slate formation. The owners are too poor to put up a mill, or this would now be a paying mine. They have a shaft down 50 ft. and a drift through the ledge, which here shows gold and galena, also a tunnel 90 ft. long, lower down the hill with a cross-cut at its face. There is one thing remarkable about this ledge: A large clay gouge is found on the west wall at every opening made. Here is a good chance for investment, and the owners invite a rigid examination by parties wishing to purchase.—*Foothill Tidings.*

Loading Hay.—A provisional specification describes an endless band elevator in a rear of a rake composed of parallel teeth which rest upon the ground with their points slightly raised. The rakes collect the crop from off the ground, and as the crop passes to the rear of the rake it is taken by the teeth of the endless band elevator, and is by it elevated and deposited into a chute, by which it is delivered into the cart or wagon.

Scientific Progress.

Vegetation Inside an Egg.—A foreign journal states that Prof. Panceri made an interesting communication to the Institut Egyptien at its meeting in December, on the cryptogamic vegetation which he had found within the egg of an ostrich This egg had been given him at Cairo, and was still fresh, the air space having not even been formed. He soon, however, noticed the appearance of dark blotches within the shell, and having been broken open to ascertain the cause, he found that they were produced by the growth of minute fungi. Instances of a similar kind had already been studied by him, and he had communicated the results to the Botanical Congress held at Lugano in 1859. The believers in the reality of the spontaneous generation of living organisms have not been slow to seize on these cases as an argument in their favor, since *a priori* it would seem that the shell of an egg would be quite impermeable to germs derived from without. Panceri has succeeded in satisfying himself, however, that the unbroken shell of an egg is permeable to liquids, and that these may introduce germs into its interior. He has, in fact, actually succeeded in inoculating other eggs with a fungus which he had obtained from the interior of one in which it had made its appearance in a way apparently so mysterious. He cultivated the fungus in egg albumen, and thus conveyed it to the uncontaminated egg.

Light and Electricity.—The English electrician, Willoughby Smith, has recently discovered a most curious action of light in altering the electrical resistance of a metal. In experimenting for a special purpose, with some small rods of selenium, about one-twentieth of an inch in diameter by three or four inches in length, enclosed in glass tubes, with platinum terminals, he found that their electric resistance varied most conspicuously and to a very great extent. He finally traced the disturbance to the action of light—finding that when the rods were enclosed in a dark box their resistance was perfectly normal, while even a slight exposure to light immediately reduced it some 10 or 15 per cent. On burning a magnesium ribbon at a distance of nine inches from the selenium rod, which, to cut off all disturbing action of heat, was immersed in its tube to a depth of several inches in a basin of water, the conductivity of the bar was at once increased nearly three-fold, remained constant while the light lasted, and as soon as the flame went out immediately returned to its original value. The discovery opens an entirely new field of investigation.—*Jour. of Chem.*

Hydrium.—This the new name proposed for the metal of which hydrogen gas is considered to be the vapor. There are several reasons for accepting this view; one is that hydrogen behaves in chemical compounds like a metal; it can replace a metal and be replaced by a metal, according to the law of equivalents, while recently alloys have been made of hydrogen with metals. Graham made the alloy of hydrogen with palladium, one of the heavy metals, and deduced from the density of the alloy and the amount of hydrogen that it contained that the specific gravity of the latter in this alloyed state of hydrium was 0.62. Recently Troost made the alloy with sodium, one of the light metals, and in the same way found for the specific gravity of hydrium 0.63. This number is very near that of lithium, which is the lightest of all metals, its specific gravity being 0.59.—*Manufacturer and Builder.*

The Siphon.—If two vessels are connected at the bottom by a tube, the water poured into one of them will rise in both to the same height, however different their width and shape may be. If, at the sea shore, a bent tube is led through a dyke, the water will, in the upper part of the tube, be on a level with the sea. If a drop of water falls into this tube, the whole sea will rise in a proportion diminishing in the ratio of its greater surface. This law, of course, holds good for any number of vessels connected by pipes or tubes. An illustration of the application of this law is furnished by the *suterazi* of the Turks, who, when desirous of conducting water from one mountain to another, construct a stone pipe leading from the slope of the former transversely through the valley, and then again up the slope of the latter.

When heat is applied to a solid, it getswarmer, until it begins to melt. As long as any of the solid remains unmelted, the heat which is continually being poured into it, melts, but does not heat it. It does not become sensible heat, but it changes the state of the solid and becomes, as it is sometimes called, latent heat. Such heat is called heat of liquefication. Again, the liquid so obtained, or another, on receiving the heat, becomes warmer until the liquid boils. As long as any liquid remains, the heat which enters it does not become sensible, but changes the state of the liquid, and is sometimes said to be latent in the vapor. Such is heat of vaporisation. The heat of liquefaction is given out when the vapor condenses.

The modern institution of railroad trains gives us occasion to observe the heat developed by frictional resistance in the heating of the railroad car axles, which often become so hot that the flame blazes out of them, setting the oil packing, and occasionally when not noticed, may in time set the car itself on fire.

Thermometers.

The simple principle of the thermometer is that a change in temperature produces a change in volume; and upon the uniformity of this increase depends the accuracy of the instrument. As instruments are usually made, this is assumed to be so throughout their entire range, but, in reality, this is not the case, either with a mercurial or spirit thermometer, especially the latter at low temperature, or with either one as the heat approaches the boiling point of the liquid. For measuring all ordinary ranges of temperature the expansion of mercury is so nearly uniform that the gradnations are made equidistant. If they were divided in accordance with the expansion of the mercury the spaces for each division would increase from the zero point upward, and decrease from it downward.

The freezing and boiling points are defined for the thermometer by immersion in boiling water and melting ice, and the space between these is then divided into any arbitrary number of equal parts, according to the standard desired. In the common instrument, used for the ordinary observation of temperature, the space is divided into 180 equal parts, and is known as the Fahrenheit scale, so named after its inventor. In this instrument the zero point is 32 degrees below the freezing point of water—erroneously so placed by its inventor, because he supposed that this was the absolute zero of temperature.

Now, since the rate of expansion is not uniform in the tube of the thermometer, it follows that the divisions of the scale are too short from the boiling point up or down, and too short from the freezing point up; consequently there can be only one point on the scale of a thermometer which is really accurate, all the others being only approximate, either above or below the truth.

There are yet several other unavoidable sources of error to be considered. First, the glass in which the mercury is contained also expands and contracts with the changes of temperature, but at a rate corresponding to only one-seventh that of mercury; so that, in order to be accurate, allowance must be made for this, if the graduation is made upon the stem of the instrument; if made upon the metal scale to which the glass is usually attached, still another compensation must be made, as expansion of the metal is different from either. Erroneous, therefore, as the measuring of heat must necessarily be by the use of a thermometer, it is yet an instrument of the utmost importance to the practical scientist in every field of investigation and industry. Where very minute differences of temperature are to be measured an instrument called a thermo-multiplier is used. This ingenious instrument was brought to such a wonderful degree of perfection by Tyndall that even the differences in the bodily temperature of insects could be measured, and by its use many interesting and useful discoveries have been made.—*Western Manufacturer.*

Yellow Glass for Photographic Purposes. The following simple method of testing the actinic properties of yellow glass for dark rooms is by Le Neve Foster, and the only apparatus required is a cheap glass prism. When a strip of white paper is placed on a dull black surface and looked at, through the prism, by daylight, it has the appearance of the rainbow, showing a complete spectrum. On bringing the yellow glass in question between the prism and the strip of white paper, those colors which are absorbed by the colored glass disappear. If on looking through the prism any blue or violet rays are seen, it is certain that the glass transmits the chemical rays, and hence is unfit for photographer's use. If only red and yellow be seen, it is non-actinic.

The Microscopic Examination of Well Water.—Reichardt has sought an expeditious method of determining the quality of drinking water, and recommends the use of the microscope in detecting salts in solution by their crystalline form. For this purpose, a few drops of the water under examination are evaporated on a slip of glass either at a high or low temperature, and the forms of crystals obtained, compared with those of known salts dissolved in water, and recrystallized in the same manner. In this way one can detect with dispatch and certainty, common salt, calc spar, gypsum, niter, etc., and to a certain extent the relative quantities present.

Will it Work?—According to the papers M. Michel's ingenious apparatus for indicating automatically the presence of blocks of ice or icebergs about ships is constructed as follows: A case suspended from the side of the ship encloses a bimetallic thermometer with a small rod attached to the helix, which moves right or left, according as the temperature rises or falls. When the temperature falls, the rod comes against a small metallic knob, and thus closes a circuit, ringing a bell placed near the officer on watch.

Manufacture of Gun Cotton. — Samuel Joseph Mackie, Westminster, England, claims: 1st. The treatment of the vegetable fiber with acids so as to transform it into gun cotton; the crushing of the fiber so as to destroy its capillary structure and reduce it to an impalpable mass, and the granulation of said mass. 2d. The production of gun cotton in a moist condition, and the drying of it in vacuo, as set forth.

Mechanical Progress.

The First Tool Used by Man.

It is interesting to look backwards and to find how the want of something to aid their natural power of muscle was first satisfied by the primitive man. The principal tool, judging by the number of them that have been found, was the stone hatchet, 1,500 of which were found in one spot in Lake Constance. In another 96 hatchets, 25 hammers and 25 arrow heads. There are 1,070 stone axes collected in the Copenhagen museum, some of which are a foot long, with 8¼ inches face, made of the toughest flint, which is chipped to a sharp cutting edge. They were probably tied to a handle of wood or sometimes were inserted in it, judging from the part that is polished by chafing.

With the aid of fire this tool seems to have enabled them to cut down trees of 9 inches diameter, as many thousand piles, smaller and up to that size, are found in the waters of the Swiss lakes with hatchet marks upon them. Besides being of use as weapons in war, they supplied nearly all the wants of men whose existence seems to have been spent in finding food and shelter. Accustomed as we are to a tool for every special purpose, so that they are as numerous as our wants, our respected ancestral relatives were forced to content themselves with but few in number, their trade list consisting mostly of axes, flat chisels, arrow-heads and knives, all made of flint.—*Newark Manufacturer.*

Aero-Steam Engines.—Mr. Richard Eaton's paper on the use of heated air combined with steam in locomotives, read before the British Association, has attracted considerable attention. The principle was invented by Mr. Geo. Warsop, and a stationary engine on this principle was in daily work at the International Exhibition of 1871. In the case of the locomotive named, an air pump, single acting, driven from one of the main cross heads, and secured to the frame work of the engine, in the place originally occupied by the feed pump, conveys a continuous supply of air, taken from the atmosphere, in its natural state, through a coil of pipes, fixed in the smoke box, into the boiler, at an average temperate of about 650° Fah. Within the boiler, the heated air is distributed and is continually rising, scattering the cohesion of the molecules of water, increasing the heating surface, promoting ebullition, joining the steam on its passage to the cylinder, and there greatly aiding the energy of the steam by retarding condensation, and following a higher curve of expansion. The action of the heated air also prevents a permanent settlement of incrustation on the boiler, fire box, or tubes, entirely obviates priming, and diminishes the liability to explosion. The duration of boiler, tubes, and fire box is prolonged by the non-deposit of scale, and steam is more quickly generated and more easily kept up.

Iron Clad Vessels.—The invention of iron plates to protect vessels is far from being of as recent date as is generally supposed. During the 12th century, the Normans covered their ships from the water-line up with an iron casing, terminating in a ram on the bow. Still earlier they had adopted a system of protecting the upper works with metal shields. In 1534 Peter of Arragon ordered his ships to be iron-plated, in order to protect them from the burning missiles then in common use. In 1530 the squadron of Andrea Doria contained a vessel built by the Knights of St. John, which was armored with several thicknesses of iron. At the battle of Lepanto, several ships protected their batteries with bars of iron. For two centuries no progress seems to have been made. In 1782, at the siege of Gibraltar, an engineer officer constructed six ships, which were the types of the modern iron-clad. They were covered with an armor of hard wood, leather and bar-iron. It is said that they resisted the fire of the forts for a long period, but were finally sunk by red-hot shot.

Economy of Iron Cars.—An iron car, made of boiler tin, with a capacity of ten and a half tons, weighs but 10,000 pounds, while the wooden car of like capacity will weigh 17,500 pounds—a difference so great that while 29 loaded iron cars make up a train on the Cumberland and Pennsylvania railroad, 20 loaded wooden cars make up one of equal weight. The iron cars stand the wear and tear of usage better than the wooden; come out of a wreck battered and bent but readily straightened out as well as new, whose wooden ones would be shivered to pieces and burnt, and the bolts and bars carried away in a basket. And, moreover, there is about $100 in favor of the iron car over the wooden when their first cost is considered.

Last February, Mr. J. C. Coburn, of Worcester, Massachusetts, patented a soft metal hammer, which is almost indispensable for various kinds of work. It has been designed expressly for that class of work requiring the use of a hammer that will produce no bruise on the object struck, and it meets this want in a highly satisfactory manner. These hammers are made from one and a half to four pounds in weight, with the head and handle cast in a single piece. The handle is strengthened by a rod of iron, which runs through the center.

How Thimbles are Made.

The manufacture of thimbles is very simple, but singularly interesting, and is described as follows: Coin silver is mostly used, and is obtained by purchasing coin dollars. Hence it happens that the profits of the business are affected instantaneously by all the variations in the nation's greenback promise to pay. The first operation strikes a novice as almost wicked, for it is nothing else than putting a lot of bright silver dollars, fresh from the mint, into dirty crucibles, and melting them up into solid ingots. These are rolled out into the required thickness, and cut by a stamp into circular pieces of any required size. A solid metal bar of the size of the inside of the thimble, moved by powerful machinery up and down in a bottomless mold of the outside of the same thimble, bends the circular disks into the thimble shape as fast as they can be placed under the descending bar. Once in shape the work of brightening, polishing and decorating is done upon a lathe. First the blank form is fitted upon a rapidly revolving rod. A slight touch of a sharp chisel takes a thin shaving from the end, another does the same on the side, and the third rounds off the rim. A round steel rod, dipped in oil and pressed upon the surface, gives it a lustrous polish. Then a little, revolving steel wheel, whose edge is a raised ornament, held against the revolving blank, prints that ornament just outside the rim. A second wheel prints a different ornament around the center, while a third wheel with sharp points makes the indentations on the lower half end of the thimble. The inside is brightened and polished in a similar way, the thimble being held in a revolving mold. All that remains to be done is to boil the completed thimbles in soap suds, to remove the oil, brush them up, and pack them for the trade.

European Ordnance.—All heavy ordnance are now built with steel barrels—this material being found best capable of withstanding erosion from the powder and indentation of the shot. But much divergency occurs in the mode of supporting the barrel by exterior layers of metal. Woolwich obtains support by coiling round the steel barrel bars of wrought iron. Vavasseur supports the barrel by shrinking on hoops of steel, so reguleted that the first layer of hoops shall not come into serious operation until the elasticity of the barrel has been developed. Krupp, who has been gradually assimilating his construction to that of Vavasseur, first by abandoning block steel for the breech, and then abandoning it for the chase, still makes the barrel much thicker at the inner end than is found desirable in this country, and so shrinks on the outer as to cripple the elastic action of the barrel. The French have adopted a system of construction which would be tolerable enough in conversions of old cast iron guns into rifled ordnance of an inferior order, but is without any merit but cheapness in new pieces. A steel half-barrel is embedded in cast iron, and further supported by steel hoops over the powder chamber. By this means the elasticity of the steel half of the barrel is crushed, and a joint with cast iron formed in the interior.

Double Chronometer Bank Lock.—A few days ago the Stockton *Independent* noted the fact that an automaton lock had been placed on the safe of the First National Gold Bank, and similar attachments have been placed on the safes of the Stockton Savings and Loan Society's bank, and the San Joaquin Valley bank. The attachment is known as Sergent's patent, and consists of two independent clock movements of the most complete and thoroughly finished workmanship. At the time of closing the bank, the movements are set in a manner somewhat similar to that of setting an alarm clock, to open or release a bolt at a given hour. The time of opening can be regulated from one to forty-eight hours. The chronometer attachment releases a bolt placed as additional security to the combination lock, and without the release of which the safe or vault cannot be opened even by those possessing the combination. The clock work is made double, so that in case one movement should in any event stop, the other will remove the fastening of the bolt which secures the whole.

George Stephenson, of English origin, the inventor and father of the railway system, was the son of a poor miner, and was born in 1781. Blacket, also an Englishman, made the first locomotive to travel on a smooth rail. Stephenson saw this engine, and decided that he could make a better one, and having $4,000 saved, he put it all into the construction of a locomotive, that broke down at the first trial. His patience and perseverance, two qualities requisite in an inventor, did not fail him, and he succeeded in making one of the grandest inventions of all the ages. At one step of his genius, he quadrupled the power of the engine, and in that invention he made a step so gigantic that it can never be forgotten.—*Ex.*

An invention by Signor Abbiati of a new plow for clearing the tracks of railroads, is attracting attention, and the claim is made for it that it is both expeditious, thorough and cheap. The machine, which operates on the snow or ice, is a heavy revolving saw, or fan, which cuts into the opposition deeply, and sends the fragments flying. The snow is thrown to a great distance on either side, or, in case of a very steep bank, it is taken up and hurled backward on platform cars, by which it can be removed.

Mining Stocks.

The mining stock market hss hesn pretty lively this week and prices heve heen np, es will he seen hy onr stock tahle. Dividends are in order at this time of the month, end elready fonr have heen annonnced. Crown Point pays $3 per share; Cheriot Mill, (Sen Diego,) 40c.; Belcher, $4; and Consolidated Virginia, $3 per shere. Hele & Norcross has levied another assessment, its 44th, amounting to $80,000. This assessment makes a total of $1,450,000 collected in assessments hy this mine, egsinst $1,598,000 dishursed in dividends, the last one of which was paid in April, 1871. Affairs on the Comstock ere looking well, and the *Enterprise* of Saturday says: The ore-hodies recently developed in the Ophir, Imperial, Empire and other mines along the Comstock, are constantly improving es the work of their exploration progresses. This finding of ore et points where it was long vainly searched for is very encoureging to snch of onr mining companies as are still at work in the barren portions of the vein, es it shows them thet as long ee they have the vein they are liable to drift into sections that are fertile. Prospecting was never more active theu at present, nor were our mining companies ever before so well provided with machinery and fecilities of every kind for oheaply and repidly performing the work reqnired to he done for the proper opening and exploring of their mines. A nnmber of compinies that have not for some time heen crush ng—ae the Buckeye, Dayton, Silver Hill and Leo—will soon reeume the shipment of ore to the mills, and it is not unreesonahle to predict that ore will he found at no dietant day in severel of those mines which now oan boast nothing more than favorahle indications.

The Tailing Mill.—Messrs. Britten, Bsggs & Co's tailing mill started np on tailings from the Ida Ellmore mill lest Tuesdey, end operates splendidly. It hes two pans and fonr settlers. The cepacity of the psns is 3½ tons each, and they are charged every fonr hours, msking 42 tons as the totel daily (24 hours) ospacity of the mill. Only two cords of wood are consnmed per dey in driving the machiuery, and it only takes fonr men on a shift to run the mill. A Varney pan will be put in to grind the salphnrets, which will he so much clear gain. No clean-ups heve yet heen made, but they are confident thst it will pan ont handsomely. Everything is in epple-pie order, snd the hoys deserve much credit for the energy end persevereuce which they heve displayed in the enterprise. It is a great addition to the industriel pursuits of our camp, end will materially add to the wealth and prosperity of Silver City. —*Owyhee Avalanche.*

Meadow Valley.—The lowest west drift of this mioe hes been run to the Raymond & Ely line, and will he continned on until it connects with the east drift of the Raymond & Ely—of course et the expense of the laiter compeny. For ehout 200 feet the ledge carried considerahle metal asseying from $12 to $30, hut it wes impossible to prospect it at a greater depth from the rush of waler. The quantity of the letter is ssid hy some to he so great thst it is thought donhtful whether the Reymond & Ely will drain the ledge without machinery being elso placed on the Meadow Valley.—*Record.*

The mines of Big Cottonwood, Uteh, are producing considerable high-grade ore, and the roads down the cañon are considerably thronged with teams hauling ore to the Sandy smelters.

The Oregon Iron Co. shipped 60 tons of pig-iron from Portland, last week.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

Silver Glance.—*Chronicle*, Sept. 5: This mine continnes to look well, and 14 tons of good ore are daily taken from it to the mill.

Mountain.—The directors decided to place new air-boxes in the lower tunnel. The tunnel is 1,864 ft. in length, and the hoxes throughout the entire length are unfit for further use.

Exchequer Bullion.—We learn that the testing of the Exchequer ore hy the McGlew process at the M. & N. W. mill hes resulted in the production of a goodly amount of fine bullion—said to he .975 fine. We have no particulars as to the general result, as to the emonnt per ton, percentage saved hy the new process, etc., hut it is greatfying to our people to know that efter years of patient waiting and the squandering of e mint of money, we have et last found e processs hy which our rebellious ores can be made to disgorge their treesure,

AMADOR COUNTY.

Amanor Quicksilver Mine.—The progress of this mine continues very favorebly as work progresses. The main shaft is now down about 50 ft., and although not sunk on the mineral-bearing ledge, yet the indications are very flattering. The shaft is being sunk so ee to strike the ledge at a greater depth. The ore now being teken out continues very rich.

CALAVERAS COUNTY.

Rich Rock.—*Citizen*, Sept. 5: It is reported that rich ore prospecting from $75 to $100 per ton was recently struck in the Calaveras gold mine. This mine has hed frequent ups and downs and we hope the report may prove correct.

Again.—The Mullins and Ryan gravel claim, on Central hill, made a clean-up last week which amounted to $4,000.50. This is the result of six or seven weeks' work for four men.

EL DORADO COUNTY.

Rich Development. — *Mountain Democrat*, Sept. 5: We hear rumors, hut no definite particulers, of an amezingly rich mining development—$5 000 taken out in a very short time—in e gravel deposit near Grizzly flat, in which D. T. Bodhurrow is intsrested. We somewhat anxiously await reliahle perticulars.

INYO COUNTY.

A Splennid Strike.—*Independent*, Sspt. 5: The most important item of local news we have to offer this week is the confirmation of the big strike in the Virginia Consolideted, on Kearsarge mountain. The 218-ft. tunnel now cuts through a ledge of good ore throughout of 27 ft. in thickness, the perfeetly defined walls hsing that distance apart. This is at a depth of 200 it. The ledge is pronounced a perfect Comstock. The valne of this strike can hardly he over-estimeted. The ledge is all quartz, and scercely eny of it thet will not go at least $50 per ton.

Omega.—We learn that an immense body of rich smelting ore has recently been struck at the lowest level of the Omega tunnel, Cerro Gordo.

Pine Mountain District.—The prospectors are all driving away with very encouragiug results. C. Albert and hie partner are taking out quentities of nnusnelly rich smelting ore. They heve hegun on a tunuel thet will open the mine to such a depth as will prove it is or is not a mine in fact, end have no feers of the result. The tunnel on the Moffatt ledge is heing driven es repidly along as three reguler shifts can do it. In a few weeks a number of these mines will he sufficienly developed to determine their worth as regards the erection of reduction works.

KLAMATH COUNTY.

Mining.—Cor. Lake *Bee*, Sept. 3: The plecer miuing is chiefly confined to the search afier the old chennel of the river. When that hae been found the pay has been nniformly good. As it is attended with great pecuniary expense end e great length of time required to develop it, few people have either the patience or means to attempt its exploration. Messrs. Finley and Doty are the last successful strikers of this chennel. It is paying remarkably well. They are running night and day, with a working force of ten men. It is paying cleer of all expenses about $1,600 per month, and this is a well merited reward; for they labored for three yeers in its development nnder the most depressing circumstences. All honor to their enterprise. The principal interest, however, is quertz. Gradually and steadily it is approeching the position which it will soon take and hold. The hest quartz region in the State lies invitingly open to capitel and enterprise. The Black Bear is slowly, though snrely working itself into public notice and favor, through its regular and steadily increesing dividends. At present 16 stemps are running. They heve torn out the originel hattery of 12-stamps and erected a fine hetiery of 16-stamps, meking an aggregate of 32 stemps, fonr more then formerly worked.

MENDOCINO COUNTY.

Rich Developments.—*Democrat*, Sept. 5: We understend the quicksilver discove y on Dry creek being opened up by Henehaws end othere, ie making a handsome showing. Two hundred tons of rock were teken out by five

men in 10 days, and the pile has been estimated as likely to yield about $40,000.

MERCED COUNTY.

Argus, Sept. 5: We saw some dirt taken from ground lying between this town and the Merced river, on Sunday last, which, when washed, gave six colors to the pan.

NAPA COUNTY.

Flagstaff.—*Register*, Sept. 5: The main tunnel is in 300 feet, running so as to crosscut the vein, which they did, and have just got through. This vein is 20 feet wide, and the ore is of the finest quality, being cinnabar and native metal. One cannot pick up a rock and break it without finding it full of native metal. After cutting the vein, they have turned to the right and are getting out an immense amount of rich ore. On top of the hill, just over the end of the tunnel, a shaft was started, but, on account of water had to be abandoned after attaining a depth of 50 feet. All the way down the shaft its sides are lined with good paying ore. So this vein is 20 feet wide and 200 feet deep, and there is no telling how far below the tunnel it runs.

Socrates.—The title of this mine having been settled, work will be resumed soon. There is an offer of $210,000 for the Socrates, but the owners do not feel inclined to sell.

Other Mines.—The Pacific mine, about one mile above Pine Flat, on the Geyser road, promises well, Prof. W. O Easton being the principal owner and business manager. The professor is confident of striking the ledge within 75 ft. He works two shifts of men, and the shaft is sinking rapidly. The Falls mine, on the Sonoma lode, is being worked, and the owners are confident that they have struck the ledge. The Great Central adjoins the Falls, and has been sold to parties in San Francisco. The Annie Belcher is proving itself to be a mine that gladdens the hearts of its owners. A furnace will be erected here immediately. The furnace on the Rattleskake mine will be in operation in a few days. The Missouri, Kentuck and Sonoma are doing well. The ledge has been struck in the lower tunnel.

Silver Mines.—*Reporter*, Sept. 5: The developments in the Calistoga silver mine have caused St. Helena mountain to be thoroughly prospected, and parties are daily and hourly scaling its sides looking for silver indications. Three distinct silver-bearing ledges have already been discovered, the outcroppings of which, when assayed, show plainly the existence of silver and gold.

NEVADA COUNTY.

Badger Hill.—*Tidings*, Sept. 5: The gravel mines, now worked in a very systematic manner by an English company, have been paying immensely this season.

The Empire, for a mine that was condemned by the croakers not long since as being on its last legs, is doing well. The run of the mill for the last 21 days of August produced two nice bricks, which were to be seen at Delano's bank early this week, worth nearly $16,000. The mine is said to be looking well at the various faces.

New York Hill.—We were shown yesterday 98½ ounces of nice dry amalgam, taken from the plates of the Larrimer mill after a two days' run on New York hill rock. The mine looks well in the lower works, both in the drift and stopes; the quartz showing lots of free gold and the ledge being of good size. In fact N. Y. hill looks anything but like the played out mine the croakers would have it appear three years ago.

Magenta.—Everything about this mine is running in good shape. Most of the work is done on "half-shares," which speaks well for the quality of the ore, as miners usually demand a much larger percentage. Report has it that the ledge in the bottom drift is looking well,

At Lowell Hill, the mines are said to be all running and paying well. Preparations are being made for a thorough winter run, and all hands feel in good spirits.

Silver Fink.—*Transcript*, Sept. 4: Parties in this city are very much excited over assays made on some silver ore which came from a ledge located about 25 miles from this city. The specimens taken from the ledge were on the surface, and were chopped out of solid rock with an axe which the party had along who made the discovery. The ledge is about 50 feet thick, and carries silver straight; that is, unmixed with other metal. The piece first assayed yielded at the rate of $14 per ton; the second, $23; the third, $39; the fourth, $52; and the fifth $66 per ton. The prospect for surface rock is regarded as flattering, and but little doubt is entertained by the discoverers and members of the company (each of whom made the revelation secretly, and made us promise not to mention their names in connection with the matter) that an independent fortune is within their grasp. The assays were made by parties perfectly reliable, and they feel confident that a very rich discovery has been made.

PLACER COUNTY.

Coal.—*Herald*, Sept. 5: The coal excitement around Lincoln is warming up, we understand, considerably. Besides an additional force on the old shaft, we are informed that several other parties are sinking prospect holes, and many others are talking about it.

PLUMAS COUNTY.

Alturas.—*National*, Sept. 5: Mr. A. J. Gould, superintendent of the Alturas Co's mine, near Long valley, informs us that he will have the ditching completed by the middle of this month, 20 men being now at work. The iron pipe for the mine will be put together on the ground, and considerable work is still to be done in the way of building flumes, cabins, etc.; but Mr. Gould will have everything in readiness to commence with the next water season, and is satisfied that the mine will prove to be one of the best in the county.

Sales.—Mr. Thos. Haycock has sold his Gopher Hill claims to the Plumas Ditch and Water Co., for the sum of $15,250. We have it on good authority that Col. Baker has disposed of his rich gravel claims at Gardener's point, near La Porte, to Mr. Bresd, and the price named is $100,000. The claim has proved immensely rich during the past water season. It is reported that Mr. Breed, owner of the Buckeye claim, at Sawpit, has bonded several of the other claims. The claims will probably be consolidated.

SAN DIEGO COUNTY.

Shenandoah.—*World*, Sept. 2: Mr. J. T. Nash, one of the owners of the newly-discovered gold and silver ledges in this county, has just returned from San Francisco, having, it will be remembered, some two weeks since left here with two sacks of rock for the purpose of testing it. The rock was put through what is called "mill process" at San Francisco, and turned out, for one lot, $100 to the ton; the other running as high as $3,000.

SISKIYOU COUNTY.

Eliza Ledge.—*Union*, Sept. 5: The reports from this mine are of a favorable character. The ledge, where work is being done now, is about twenty inches in thickness, and the quartz is of a different character from any ever before taken from the mine. It is said to resemble very much in appearance the Black Bear quartz of Salmon river; and is believed, at least, to be very rich.

Paying Well.—The few claims still worked at French flat, on Humbug, are reported to be paying well. The claim of Spangler, Moore & Co., near the mouth of Humbug, is also, according to report, paying well.

SIERRA COUNTY.

Prospect.—*Mountain Messenger*, Sept. 5: The Saddle-back claim, owned by Kuder & Company, is prospecting fairly. From where they struck gravel they run a breast down the pitch of the rock towards the channel, and soon struck good prospects. They will push their tunnel ahead to tap the lead, and do not expect to get in before spring.

Phœnix Mine.—Work on this mine is being vigorously prosecuted by a force of eleven men, under the direction of the Beard Bros., of Sierra city. They are down about 250 feet, and the ledge has solid, well-defined walls, and is from 18 inches to three feet in thickness. The quartz shows free gold in abundance, and is worth from $35 to $40 per ton. It is estimated there are $100,000 worth of rock in sight at present.

SOLANO COUNTY.

Golden Gate.—*Tribune*, Sept. 5: The stockholders in this mine are again looking up. An installment of sulphurets assayed a few days since, yielded $165 to the ton. Another batch of about two tons was received in San Francisco on Wednesday, which pronounces to assay nearly as well as the last.

TRINITY COUNTY.

Minersville.—*Journal*, Sept. 5: The miners of this district have done well the past season. Water having given out they are now a rest.

Damming.—The Weaverville D. & H. M. Co. is putting a dam in West Weaver creek, at the head of the new ditch. This will be completed in a few days, and then nothing can be done till water comes.

Fixing Up.—Trotter & Smiley, who have leased the Reading creek ditch, are now at work enlarging it at their own expense. No flumes will be put up along the entire line; 45 men are now employed, and it is estimated that the improvements in the ditch will cost $6,000.

TUOLUMNE COUNTY.

Riverside.—*Independent*, Sept. 5: The mill has had to stop for repairs. The old mortar-beds would not work, being cracked and leaky. So they will have to wait for new ones.

The T. M. Blue Gravel.—This company has struck a new streak of gravel in their tunnel which prospects well.

The Table Mountain Alpha.—In this claim the gravel is improving in richness and quantity. They are still going ahead, and only wash the dirt taken out in driving the main drift.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Sept. 3: Daily yield, 300 tons of ore. The ore breasts on the 1,400, 1,300 and 1,200-ft. levels are still looking splendidly and yielding the usual amount of rich ore. The north winze from the 1,400-ft. level is down to the 1,500-ft. level, and a drift has been started from the bottom to connect with the south drift from the shaft on that level. This connection will complete a splendid ventilation of almost the entire mine from the 1,500-ft. level upward. The south drift on the 1,500-ft. level is being pushed ahead with vigor. This drift is still following the west wall of the ledge, the east side of the drift cutting rich ore. Burleigh drills are used in this drift, as the rock is so hard as to require continual blasting.

Savage.—Sinking the main incline is still vigorously prosecuted, the bottom in good working ground. It having become necessary that new and more powerful hoisting and pumping machinery shall take the place of the old for working the mine at its present great and steadily increasing depth, Mr. Thompson, the architect and machinist, has been sent to San Francisco to superintend the manufacture of the same. This machinery, in point of strength and durability, will, when erected, be second to none on the line of the Comstock, and is calculated to have ample power to sink the shaft and work the mine at a depth of 4,000 ft.

Ophir.—The ore breasts on both the 1,300 and 1,400-ft. levels are looking well and yielding handsomely. The ore extracted is of an increased richness, and the prospects of the mine grow more flattering as the prospecting of the different levels is advanced. The body of ore developed in the east cross-cut, 180 feet from the south line, on the 1,300-ft. level, is 23 ft. in thickness, and fine milling ore. The east cross cut, on the 1,465-ft. level, is in 67 feet, with excellent prospects of soon striking the east ore body. The north raise on the 1,465-ft. level is still in rich ore. The south raise on the same level is also in fine ore. On the 1,300-ft. level, winze No. 1 gives assays of from $150 to $250 per ton, and the north winze from cross cut No. 2 assays over $300 per ton, and shows much fine sulphuret ore. Car samples of ore for the past week have ranged from $150 to $200 per ton.

Hale & Norcross.—Sinking the main incline below the 2,000-ft. level is making steady headway, notwithstanding the close, hard character of the rock penetrated. A drift has been started from the main incline which is running directly in the ledge, and shows much fine looking quartz, but no pay ore as yet.

Sierra Nevada.—The water is completely drained from the shaft; some of the bottom timbers which had been damaged have been replaced, and sinking the shaft will be resumed. The ore breasts in the old upper workings continue to look well, and show no signs whatever of exhaustion. Daily yield, 60 tons of ore, keeping the mill steadily running.

Gould & Curry.—The north drift on the 1,500 ft. level has made connection with the north winze from the 1,400 ft. level of the Virginia Consolidated, thus securing the thorough ventilation of both mines down to that depth.

Sutro.—The main west tunnel is still being driven vigorously ahead, the rock in the face blasting out finely. There is a steady flow of water from the face, but not enough to impede progress.

Woonville.—The recent good developments made at the 200-ft. station of the incline still hold out, and promise a yield of fine ore. In the north drift, at the third station level, the ore body shows considerable improvement, and the quality of the ore is even better than on the level above. The mill was started up crushing ore this morning, of which the company has between 300 and 400 tons at the surface and ready to hoist from the mine.

Julia.—The enlarging of the main shaft will be completed in a day or two more, which will then give a fine, well timbered three-compartment shaft for working purposes, to the depth of 1,100 feet. The foundations for the new machinery are progressing finely.

Dayton.—The water has been reduced below the third station level, and work resumed throughout the entire mine. The extraction of ore from the different ore stopes, both north and south, on the third station level has been resumed, the regular shipment of ore commenced, and last evening the Woodworth mill, on the Carson river, was started up crushing ore from the mine.

New York.—Sinking the shaft is making excellent progress, the bottom in clay and quartz, with some fine streaks of ore. The face of the main west drift, at the 600-ft. level, also shows some fine prospects, the streaks of quartz and ore encountered being of a very encouraging character.

Belcher.—Daily yield, 550 tons of ore. The mine has greatly cooled off during the past few weeks, which allows of resumption of much of the prospecting work on the lower levels. The ore breasts and stopes on all of the ore-producing levels are looking well and yielding finely.

Leo.—Assays from face of tunnel to-day reach $25.84, and from the stope $160.92. The stope is yielding some excellent ore for milling.

Crown Point.—Daily yield, 550 tons of ore. The mine is looking splendidly throughout. The ore breasts and stopes on all the different ore-producing levels are not only looking well but keeping up the regular yield of rich ores.

Chollar-Potosi.—Daily yield, 110 tons of ore, the assay value of which is $30 per ton.

Union-Consolidated.—The north drift on the 1,300-ft. level of the Ophir shaft has been driven over 900 ft. from the shaft northward, following the west clay wall of the ledge, cutting in its course some fine indications of ore.

Imperial-Empire.—The bottom of the south winze, on the 1,850-ft. level, two days ago passed out of the ore body into barren ledge material, but yesterday afternoon ore again appeared in the bottom, of a richer quality than ever,

California.—The north drifts, on the 1,400 and 1,500-ft. levels, from the Virginia Consolidated shaft, are still driven vigorously forward. Two drifts have been started on the corresponding levels from the Ophir.

Sutro Tunnel.—During the past week much better progress has been made with the efficient assistance of the four Burleigh drills. Eighty seven feet have been added to the length of the tunnel.

Utah.—The flow of water at the bottom of the shaft still continues too strong to admit of a resumption of the work of sinking the shaft.

Overman.—The main north drift on the 1,200-ft. level is still driven ahead, following the ore. This streak of ore is widening out and shows considerable improvement in quality.

Daney.—The face of the main west drift at the 400-ft. level yesterday afternoon again penetrated a fine streak of quartz of a very promising character.

Caledonia.—The main shaft is now down 60 ft. below the 900-ft. level.

Baltimore Consolidated.—Sinking the main shaft is making steady progress. Prospecting is being carried on vigorously.

Knickerbocker.—The main shaft is now down 60 ft. below the 600-ft. level.

Original Gold Hill.—Driving ahead with the west drift at the 320-ft. level, and occasionally meeting with good looking stringers of metal bearing quartz.

Justice.—Erection of the new hoisting and pumping machinery is making good progress. Daily yield, 40 tons of ore.

Buckeye.—The extraction of ore from the first station level, both north and south, has again been commenced. Yesterday the Hope mill was started up crushing ore from the mine.

Yellow Jacket.—The main east drift on the 1740-ft. level is in 136-ft. from the shaft, in fair running ground.

Mint.—Sinking the main shaft is making steady progress, the bottom still in soft sinking ground.

Tyler.—The strong, steady flow of water still continues, and there seems but little hope of overcoming it until more powerful machinery can be erected.

Florida.—Very little progress is made in sinking the new shaft, owing to an increase of water.

Bullion.—There is no change to note, except the steady and very favorable progress of the main north drift on the 1700-ft. level of the Imperial shaft.

Nevada.—The lower tunnel has passed through the clay, and the face is now in vein matter of very valuable character.

Pictou.—Tunnel still driving ahead, and making good progress. No change to report.

Succoa.—The new shaft is cleaned out, the water drained, and the sinking resumed.

Dardanelles.—The timbering of the shaft is finished and sinking resumed.

EUREKA DISTRICT.

Eureka Consolidated.—*Sentinel*, Sept. 6: The ore raised from the Leviathan shaft is of fine quality, being a soft, greasy looking carbonate, such as the smelter likes. From the old Champion works the yield continues about the same, and since last week a new streak of surface ore has been worked upon, between that point and the Windsail shaft.

K K.—Shipments of ore amount to 80 tons per day of first and second class. The ore chambers are looking better. The main shaft is 380 ft. deep and is now in rusty rock, which promises well for ore at no great distance. There are 70 men employed and more will be put on as soon as possible.

The Richmond.—Two 16 and 18-horse and mule teams are bringing about 120 tons of ore per day to the furnace.

British Company.—The Industry and Chief of the Hill are yielding about five tons of ore per day for 11 men employed. The Connolly, belonging to the same company, is opened 180 ft. deep by an incline, the lode at that point being strong and yielding from 10 to 12 tons of $120 ore per day, with 16 men at work.

Hoosac—Employs 40 men, the large increase made of late affording good evidence of the improved appearance of the mine. It is worked to a depth of 240 ft. and is still yielding a fine grade of smelting ore.

The Dunnerbeag.—The incline is now 300 ft. deep. The ore in sight is larger in amount and of better quality.

Pioneer Consolidated.—The strike has developed into a body of ore about eight feet in thickness.

Bullion Product.—The bullion product for the week is as follows; Richmond, 225,630 pounds; K K, 120,000 pounds; Eureka Cons., 99,000 pounds; Hoosac, 90,000 pounds. Total, 534,630 pounds.

Bullion Shipments.—Following are the amounts of bullion shipped by the respective furnaces: Richmond, 200,000 pounds; K K, 80,000 pounds; Eureka Cons. 75,175 pounds; Hoosac, 60,000 pounds. Total, 235,175 pounds.

Spring Valley District.—For 21 months Mr. Charnock has done all his own blasting with single-handed drills; has hoisted his own dirt, and has now, after great toil, reached a depth of 220 feet on the incline. He has been much troubled with "fants," but has at last got a good face of ore, which he is certain will average $100 per ton, the assays being twice that amount.

Diamond District.—The furnace is undergoing repairs. Seven men are employed on the Champion mine, and excellent ore is yielded by it, some specimens we have seen having a close resemblance to the Hoosac first-class.

A Promotive Quicksilver Mine.—The Napa *Register* learns that the last month's run of the Redington quicksilver mine amounted to 900 flasks. This was the production of two furnaces, the old furnaces being in course of demolition to make room for two others that are to be erected on a much modified plan of the superintendent, and for which 400,000 bricks are already prepared and on the ground. Only 125 men were employed during the month, and we are certain, says the *Register*, that this yield goes ahead of the monthly returns of either the New Idria or the Almaden mines.

The machinery for the Renton coal mines has arrived at Seattle.

Machinery at the Fair.

Windmills.

It is said that windmills were invented or first suggested by Hero of Alexandria—the same person who is credited with having first demonstrated that steam might be employed as a motive power. However this may be, the first practical use of wind mills, mentioned in history, refers us to the year 1408, when they began to be employed in Hollsnd. About one hundred years later, we find tbst they were very extensively used in tbat country, where they are still more generally employed than in any other region. From the time they were generally introduced there until the days of steam, this prime mover occupied an important position in the industries of the world, for grinding, sawing, pumping, turning, expressing oil, etc. Among all modern improvements since the days of Sancho Panza, and before, few have been of more practical value to the human race than the windmill.

The crude structure of a century ago, with its slow-moving huge srms, seldom more than four in number, and requiring a massive structure for its support, bears but a slight resemblance to the light, many-srmed, swift-moving mills of to-day. Tbere are, no doubt, many visitors to the Fair who will remember some of the huge old structures of this class of years ago, which were employed in the older States for grinding wheat, corn, etc. In Europe, aud eepecially in Great Britain, many of these old structures still remain, and now aud then those are met with which are still kept in active use. There are vertical and horizontal windmills; tbose with arms outstretched, and those witb arms (or fans) so closely enclosed, that one would scarcely infar that the structure was a windmill at all. The largest windmills in Holland are said to run from twenty to thirty horse power. Perhaps one of the most remarkable nses to which this description of power is employed, at the present time, is that of driving a ten-stamp quartz mill on one of the West India Islands, where mining for gold hss lately been introduced.

The windmill, while it performs all the offices of steam, except where an exceedingly uniform motion is required, consumes no fuel, requires next to no attention, and is of but trifling cost. Catching the breeze from every quarter, it brings it in quiet subjection to man, and employs its power in various ways, but most of all, especially in this State, to disperse the aqueous gift of Heaven to the thirsty soil or grateful beast. Still, ss "the wind bloweth" only when "it listeth," and as in this prsctical age most human indnstrial operations must be conducted in exact succession, and at fixed times, steam has slmost entirely superseded the use of wind.

Only one specimen of this useful device is exhibited in the Pavilion; but that is a model, not only in size, but in the matter of design and construction as well. It is shown near the upper end of the machinery department, by W. I. Tustin, corner of Market and Beale streets. It is styled "The Economy Windmill," aud probably combines as many advantages and improvements as can be found in any one other in nse. It is simple ss well as ornamental.

We understand that Soutbwick & Co., 428 Snnsome street, will have one of their celebrated "California Dexter Windmills" on exhibition withiu a day or two. Many of these mills sre now being put up in different parts of the State, as at Menlo Park, Monntain View, Oskland and other points. The Compsny is now putting up a $1,000 mill at Bridgeport, in Solano county, for grinding purposes. For this purpose they are unexcelled, as they are perfectly self-regulatiug. One has been put up for J. H. Latham, at Oakland, for $1,900. This mill runs in a light wind, and from its mode of constructiou it would seem to be but little liable to get out of order.

Perhaps no other portion of the world has done more than California, to revive and improve this useful and cheap mode of obtaining power. An important incentive to the lsrge employment of this power on the Pscific Coast is the remarkably (for this latitude) constant reliance which may be placed upon the wind here. While in Holland there are but one hundred and forty-five days on the average in the year, on which wind power csn be made available, there are nearly or quite double that number of daye ou which it can be made avsilable iu most parts of Cslifornia.

Horse Power.

Another cheap and often very convenient powor, especially for employment on the farm is thst operated by the horse. By it, a horse may be made to pump, saw, grind, churn, and do many other things on the farm which would otherwise, perbaps, have to be done by hand. Hence a cheap, durable and convenient horse-power machine is a very desirable and important mechanical contrivance. We notice several such on exhibition, on which much skill and ingenuity has been expended.

Mr. Tustin exhibits three devices of this kind which he respectively denominstes The Eclipse, The economy and The Eagle. All are constructed upon the same general principle, hut each differs more or less from the other in some one or more parts of the detail—especially in the gearing.

The Excelsior Windmill and Horse-power works, Messrs. Atwood & Bodwell, exhibit three or four machines from their manufactory, located at 211 and 213 Mission street.

C. P Hatch also exhibits a horse-power manufactured by him at Petalums. These machines work with seven levers, and up to fourteen-horse-power.

Prospect for California Tobacco.

The misfortunes of onr neighbors in the tobscco crop of the present season are likely to work to our special benefit. Even before the opening of the season active influences were in operation beneficial to our interests. For the last two years production has been discouraged, somewhat, by published statements of the sccumulstion of tobacco on the bands of holders. The proportion of inferior grades was supposed to be especially large; this phase of the market being particularly effective in bringing down prices.

This was known at the opening of the present season, and somewhat discouraged planting; but it was not supposed that the falling off was so great as it is now ascertained to be. By the agricultural report for July, made up from statistics from all the States, we learn that less tban half the usual acresge was set last spring. In Kentucky only about 20 per cent. of the usual acreage was planted. Tbe tobacco acreage of Connecticut is estimated at about 50 per cent. of that last yesr. It is said that the crops on even this limited acresge do not look favorable.

It is also ascertsined that the stock of old tobacco on hand is not as large as was supposed. These facts having been made known, the prices of tobacco are tending upwsrd; snd that portion of eastern and southern tobacco growers who hsve been holding on to tbeir stock, awaiting an advsnce in price, will probably do well. This favorable change in the tobacco market hsppens extremely opportunely for California; this season's tobacco acreage being larger than usual. Tho inherent merits of our tobacco, and the advantsges of our curing process, will stsnd a better chance of being recognized than in ordinary seasons; and we hope to see as great a gain in reputation as in immediate pecuniary profit. Look out for inflation in next yesr's tobacco acreage.

Sorghum.

Accordiug to recent reports of the Agricultnrsl department, the smount of sorghnm growing in the several States at the present time, compared with former years, is as follows:

Alabsma bas increased her acreage 11 per cent.; Minnesota, 9 per cent.; Texas, 6 per cent.; Mississippi and Arkansas, 5 per cent.; Knnsas, 1 per cent.; Delaware reports the same acresge ss last year. In other States there is a decline, the minimum, 77 per cent., being in Marylsnd. New England, New York, New Jersey, Pennsylvania, South Carolina, Florida, Louisiaua, California aud Oregon make no returns of the crop. Tbe condition is one per cent. above average in Texas; full average in Delsware, Michigan and Wisconsin; in tbe other States it is deficient, Kentncky showing the greatest decline, 43 per cent. below average. Several counties in different parts of the country report a declining interest in sorghum culture. It will be seen that California is among the States thst make no returns.

There can be little inducement for introducing the crop here. It cannot compete with our beet crop for sugar making. In those portions of the country where beets cannot be grown to advantage for sugar making, and especially where meaus are not available for making sugar on a large and expensive scale, sorghum may be grown snd converted into syrup, tbus forming a cheap substitute for sugar; but the results from its growth in America during the long period of its experimental growth, does not warrant tbe belief that it will ever become a staple product in any part of the country; least of all in California. We believe, however, that sorghum could be grown to advantage by the farmers here as summer fodder. The mid-summer season in California correspouds with the winter season in the Esstern states, in the difficulty of carrying cattle through in good condition. Sorghum would answer admirably for this purpose.

Tellurets.—When the sdvancing army of prospectors gets on to a mineral belt, especially if it is a tellurium trend, they are pretty sure to find its beginning snd ending. Northeast from Sunshine, the line of croppings has been followed to the Lee Hill, and there, we are informed, a California Co. are at work opening up the tellurets. The reason why this rare ore is so much coveted, is because if the prospector gets it, it is almost sure that he can "just fry the gold right ont of it."

At first it was thought incredible that it existed outside of the Red Cloud and Cold Spring. The opening of the Forest on Four-mile showed that it existed far to the south. Next it was found to the north, across the Left Hand, in the Gray Eagle. Then again it was found not stingily put into the splendid chain of lodes that binds the southern brow of Gold Hill. The next astonishment was in discovering the stuff at Sunshine, cropping there at the grass roots, while at other points these tellurets were not expected until considerable depth had been gained. And last of all it is reported west, at West's, on Left Hsud.—*Boulder News.*

Revival of Smelting at White Pine.

Is it not a little singular that the gold miner of 1849 became the silver miner of 1869, and the miner for the base ores in 1869? The order was natural and necessary, because the progress wss from the most simple and profitable to the more complex, dependent for profit upon skill and practical experiment. The result of the various experiences of the mining population has been the preparation of a class of practical men, capable of ntilizing the vast stores of metallic wealth which may be said to cover not only the whole surface of Nevada, but also that of the adjscent States and Territoriss. This business must constitute the solid fonndation of the future wealth of Nevada especially, for though the Comstock and the exceptional free gangues of other sections of the State may continue to furnish an annusl tribute equal to the average of the last ten years, the resources of the base mines are capable of a yield far beyond those of the free, and it may be asserted with a greater certainty of profit.

The first efforts at the reduction of base ores commenced at White Pine in 1869. The men who conducted the business were without experience. It did not prove profitable, mainly because of the difficulties arising from the distance of transportation. The business was dropped after a few months' trisl, and has laid dormsnt until the present summer. Since the riss of Eureka, great progress has been made in the treating of these ores, and a school of smelters have been educated there under the very glare of its furnaces, who excel the most skilled operstives of the Old World. Indeed, with characteristic ingenuity these novices have devised contrivances for the bettering of the furnaces and facilitating the work of reduction, which have been carried back and accepted by the veterans of Swansea and Freiburg. These unlettered men are doing for the State a hundred times more than the scientific sons of the academies, and with their nstive intelligence snd horny hands, are working succesess where the recipients of diplomss only wrought failure and disaster to capital.

In addition to tbe Mattison smelting works, sn account of which is given in another column, we are informed thst local capital is about to take hold of the very favorable locality of Swansea, which commands a number of the finest base ledges of this district. Situated as tbis place is, in the center of innumerable mines, among which may be named the Imperial, Fay, Mobile, aud Miser's Dream, and having abundance of water and wood for the making of charcoal, we hope and confidently expect to see the prediction made by Mr. McGee realized, that Swansea will rival Eureks in the production of base bullion.

The Howland Tunnel.

The Howland tunnel, located in Little Cottonwood mining district, says tho *Tribune*, is a project which bas attracted the interest of mining circles both in Utsh and Californis. During tbe last two years work on this great enterpriso moved slowly until lsst spring, when the company was recognized with Mr. B. O. Cutter as President, and this gentleman with Mr. Howland, the projector of the tunnel, are its active managers. Under their control renewed activity, and operations on the grandest scale were inaugurated. The plans in complete detail were matured, all looking to the early completion of the enterprise. Preparatory to the carrying out of the design the company had a map of the district made from the most accurate surveys by Col. C. L. Stevenson, one of the most eminent civil engineers in the country. This is literally a correct chart of all the mines adjacent to and on the route of the tunnel, with reference to the claims of Big and Little Cottonwood districts. We had the pleasure of examining the map, and have no hesitation in pronouncing it the

Most Exact Work of the Kind

Ever made in this Territory. It shows the location of the mines, longitudinal sections of that portion of the tunnel already cut and timbered, also the cross sections at the mouth of the tunnel, and the geological sections through the Davenport and Emma hills. The excavation is now in between four and five hundred feet, and has crossed four excellent veins of ore, one of which is from four to ten feet in thicknsss, and a good quality for milling. Day and night shifts of workmen are constantly employed, and the energy of the management is being rewarded with encouraging prospects. The mouth of the Howland tunnel, on the Little Cottonwood side, is situated just below Alta city, running thence through the hill diagonally, passing through the principal mines, and comes out directly east of Big Cottonwood by way of Cutter gulch. When completed this tunnel will be about four miles long, and in addition to its use as a channel, through which the wealth of the mountain is to be conveyed, it will also be made the route of a railway to connect with projected lines to be constructed at no distant day toward the Union Pacific, at some favorable point of junction. There is no question as to the feasibility of this ultimate result of the work now going on, but the immediate effect of tunneling the inexhaustible minersl belt of the Cottonwoods will be found in the enterprise itself, as it penetrates the rich deposits which assuredly lie in its path. These are certain to compensate the projectors for their daring energy, though the world, and especially our own Territory, will be greatest gainer for what they are doing.

The Rye Valley Mines.

We take the following article on the mines of Rye valley from the *Bedrock* (Oregon) *Democrat:*

On last Wednesday week we took passage on board the hurricane deck of the "Cayuse," and started for the mining camp of Rye valley, st at the lower end of Pleasant valley. Rye valley is entirely surrounded by hills and mountains, in which are found the rich placer mines and quartz ledges which make this camp noted and reliable. The town has some 30 or 40 buildings in it, built on both sides of the one street running up and down the valley. Across the stream, which meanders through the valley, are located the placer mining claims.

These claims are better and more scientifically opened than any others we have ever visited. To give our readers an idea of the amount of work done in opening these claims, we will, as well as we can, describe the claim of J. C. Powers & Co. The main bedrock tunnel running from the flat back to the claim is 500 feet long and well timbered; it is 55 feet below the rim rock, and the surface dirt over this is from 30 to 50 feet in thickness; there are three head races and tunnels running into the main bedrock tunnel that are from 150 to 250 feet in length; besides these there are two tunnels from 80 to 100 feet running into the hill above the head races. This claim is worked by hydraulics with 130-feet pressure, with 2½-inch nozzle stream. W. W. Webber's, James Odell's and Lafay's claims are all working on the same principle. Lafay's claim is worked with two hydraulics, and the surface dirt is some 70 to 80 feet deep above the rim rock. A great drawback to this camp is the scarcity of water, which is all csrried in the ditch of the Rye valley ditch company, of which Walter Fernsld and James Odell are the principal owners, as well as being owners in the mining claims above mentioned. At the most flush times there is not to exceed about 800 inches of waler svsilable for mining purposes. R. S. Johnson's claims, below town, are worked on the same principle as are those above mentioned, and are considered as good ground as is in the camp.

In the hills and mountsins back of these placer claims are found the rich quartz ledges that are bound ultimately to make this one of the liveliest and richest camps on the coast. Gilchrist & Co. now have a five-stamp mill in complete operation, crushing rock from their ledge, the Lafayette, which is very rich in both gold and silver. Charles Green is getting out the timbers for a 20-stamp mill, which he expects to have in operation yet this fall pounding out the precious metals from Grsen's discovery and the Monumentsl. There are a great many other ledges in this district that have already been discovered, but are not yet opened; therefore their extent or richness are not known. We understaod it is the intention of E. M. White & Co. to remove their mill from its present location, near Gem City, and place it on the Dsvis ledge, about five miles this side of Rye valley. All the indications lead us to believe that Baker and Grant counties can furnish as good mines and as many of them as any other sectiou of country on the Pacific coast.

Important to Inventors.

The following letter, which wss recently received from an old client of Dewey & Co., now residing in one of the EssternStstes, speaks for itself, and will do more, perhaps, to convince inventors of our capacity for business than sny nnmber of lосsl compliments. We extract as follows:

Gentlemen: It wss through your honse that I secured my first patent, and although I hsve since done business here in the Atlantic States with the ablest patent solicitors—gentlemen who have done me justice—yet I have often regretted that you were too far off to advise with me in my cases. It has taken a longer time with every patent I have taken out since I left California and came Esst, than in the cases you prepared for me in San Francisco, which is certainly very creditable to you.

By the way, one of my patsnts has passed the ordeal which is the essential test of a pateut's value. I mean that of a trial in the courts, and it stood the battling of one of the best lawyers in the country. The specifications and claims were completely made out and there was a perfect comprehension of its priuciple during the trial. Since giving it this test we thought that we would make it even stronger, if possible, and submitted it to one of the best patent solicitors for advice. After a careful examination of the case he advised us to let it alone as it stood, saying that whoever made up those papers understood their business. I then informed him that they were drawn up by Dewey & Co., of San Francisco, and he replied that he knew you well by reputation. * * * * * Very truly yours,

L. L. Sawyer.

Meriden, Conn., May 16, 1874.

From Tybo.—The mines in Tybo district sre now being worked with satisfactory results. The new furnsce has been in constant operation since starting on Monday last, and is producing a good quality of bullion. Both towns, Upper and Lower Tybo, are growing rapidly, and if building continues will soon consolidate. Nine of the softer sex now grace the place, and on Tuesday next a grand ball will be given. We acknowledge the receipt of an invitation, but cannot spare the time to attend.—*Eureka Sentinel.*

Good Health.

English Food Adulteration.

It appears, from the statements of the New York *Herald's* London correspondent, that shipments of spurious teas, adulterated wines and spirits, and fraudulent packages of Roman cements, together with a number of other commodities, all more or less adulterated, find their way to our markets.

Tea is doctored in order to improve its appearance, increase its bulk, and add to its weight. For the two last mentioned purposes, finely ground quartz and iron or steel filings are employed. Catechu gum, an astringent substance, is also used, but the favorite ingredient seems to be "lie" tea, or old tea leaves once used and then worked over. This is mixed with low grades of new tea, and placed in cylinders under steam, together with a quantity of carbonate of magnesia. Dutch pink, and Prussian blue. The adulteration with "lie" tea is usually done in China before export, but the "facing," as the coloring is termed, is performed by people in England who become skilled in the fraud as a business. The dealers face the tea to render it black or green, according to the desires of customers. Out of 170,000,000 pounds of the commodity annually consumed in England, it is asserted that one fifth, or about 35,000,000 pounds, is open to suspicion.

British wines, according to the testimony of several analysts, are largely adulterated with potato spirit; sherry is doctored with sulphuric ether, and to other liquors fusel oil and French treacle or brandy, which is often nothing more than beet root spirit colored and flavored. Beer is now comparatively pure, and the main adulteration is simply water.

In butter, often as much as 40 per cent. of water is found; patents have recently been obtained for a compound called "butterine;" and two other artificial mixtures, known as "Australian" and "Dutch" butter, have appeared in the markets. The Australian stuff is bone fat extracted by steaming refuse bones. It sells for 15 cents per pound, and smells horribly. Dutch butter is a mixture of genuine butter and American lard. There is, beside, a French butter, compounded of drippings and kitchen stuff colored with annatto.

Corn flour, a material largely used for food for children, is described as generally worthless and unhealthy. Thirty-three out of seven thousand grains, a pound, one analyst states as the proportion of nutritious matter contained, where there should be at least eight or nine hundred grains. The article is nothing more than starch, a fact proved by the circumstance that a dog fed upon it died of starvation.

Other well known adulterations in bread and milk are noted; but as these commodities do not come under the head of possible exports, allusion to them is unnecessary.

CAUTIONS CONCERNING THE USE OF PARIS GREEN.—Those who use Paris green for the extermination of the potato beetle should bear in mind that it is a most dangerous and deadly poison, and they cannot be too careful lest it prove fatal to "larger game" than the bugs. All packages of these substances should be plainly marked Poison. There is great danger in the mixing of this green for the potato bug, owing to the fine dust which arises in the process, which is inhaled, and also rapidly absorbed by the pores of the skin, especially if the person using it should be in a state of perspiration. To guard against this, the hands and face (particularly the nostrils) should be protected as much as possible, and should be carefully washed after working with it, or with any of the preparations of which it is an ingredient. As it penetrates and poisons wood, gets into the seams and crevices of articles made of metal and even into earthenware that is at all porous, it is important that all household utensils, or anything in barn or stable (which cattle or horses could have access to) in which the article may have been mixed, or from which it has been used, should be carefully set aside, and never again used for any other purpose. Malignant sores are not unfrequently caused by scratching the skin when itching or irritated from handling the green. —*Boston Journal of Chemistry.*

DOG DENTISTRY.—It is well known that the bites of rabid herbivorous animals are rarely dangerous, because their teeth are made flat-faced, for grinding their food without penetrating or tearing the tissues. Hence their bite is little more than a severe bruise, differing from that of a carnivorous animal, which pierces immediately through the skin. A veterinary surgeon of Paris, M. Bourrel, recently captured three mad dogs; and, tightly securing them, proceeded to file down the teeth. These animals he let loose with six other dogs. The latter were immediately furiously attacked, and frequently bitten, but in no case did the pointless teeth inflict more than a bruise. Not content with this, M. Bonrrel put on a thin, kid glove and then worried the mad dogs with his hand, until they bit him several times. Although pinching quite hard, the glove was not broken in a single instance, while the skin beneath was uninjured. As to whether we had better substitute a city dog dentist for the present pound master, we leave the question to the humanitarians who are endeavoring to abolish carbonic acid and the muzzle. — *Scientific American.*

The Eyes and Spectacles.

We are glad to see that one man at least has been found who is brave enough to face popular prejudice in the matter of spectacles—and he writes, in the Boston *Journal of Chemistry:* An old writer, living before the days of illuminating gas and kerosene, remarks that the "first sign of the need of spectacles is a tendency to bless the man who invented snuffers." In this age we should say that the first sign is to find one scolding about the publisher of his daily newspaper, who is charged with filling his columns with type growing every day more diminutive and indistinct. When a man or woman reaches the age of 45 or 50, it is generally found that some aid to natural vision is required. The discovery of this want is very liable not to be made soon enough, and the eyes suffer greatly in consequence. There is also a foolish pride which prevents some people from adopting spectacles after the discovery is made. There is no truth relating to vision more important, and which therefore should be more clearly understood, than this: that in every case of defective eyesight, whether it proceeds from advancing age or from congenital causes or from accident, artificial aids should be resorted to without delay. The tendency is in all, or nearly all cases towards irreparable injury, when this aid is withheld. It is true, bad or ill-adapted spectacles may and do cause injury, and so do improper medicines, or injudicious food or regimen. If proper care is used in selecting glasses, and the right ones are obtained, they strengthen vision, and the vigor of all the functions of the organs concerned in the phenomena of sight is increased. A child discovered to be "near-sighted" should be promptly furnished with appropriate glasses, and they should be selected if possible under the advice of a competent medical man or optician. In the case of persons who have passed middle life, as soon as it is noticed that the best artificial light is sought, or that letters grow apparently smaller or less distinct, or that the near point at which one can see distinctly is more than eight inches from the eye, the time for spectacles has arrived.

Middle Age.

Here is some English advice as to the proper way to spend middle life, with a view to sanitary requirements: From 45 to 55 the recuperative powers should be encouraged and developed. There is nothing like work to keep an old horse sound. Sporting dogs should be thin, but obesity will set in. About this time man has his first serious illness, or he gets a heavy fall, loses his nerve, and becomes miserable. Anxiety ought to be staved off, hope encouraged, sordid cares avoided. If a grief exists, it should not be brooded over, but talked out with a friend, gauged, estimated at its worst, and dismissed to absorb itself. If a man at this time is much occupied in out-door sports—hunting, shooting, fishing, etc., and lives wholesomely and temperately, he is pretty sure to be clear of sedentary disease. But he may probably have to his account a broken rib or collar-bone, or get a heavy fall from his horse. The last is often owing to the greater caution in riding produced by age and increase in weight; for riding boldly at a fence, as young blood does and light weights can, frequently saves horse and man from disaster. For this reason middle-aged men should not ride old horses. Rheumatism, coughs, and inflammatory diseases arising from exposure to wet or cold a man of 45 will have to contend with, but his blood will be in good condition for the struggle. Moderate exposure to hardships of this kind, like moderate irregularity of mealtimes, never harmed man yet.

EYES AND COLD WATER.—The *American Journal of Health and Medicine* says: Many persons are ruining their eyes by opening them in cold water of mornings. Cold water will harden and roughen the hands, and much more will it do so to the manifold more delicate covering of the eye; or the eye will, in self-defense, become scaly in the manner of a fish; that is, the coats of the eye thicken, constituting a species of cataract, which must impair the sight. That water, cold and harsh as it is, should be applied to the eye for curative purposes in place of that soft, warm, lubricating fluid which nature manufactures for just such purposes, indicates great thoughtlessness or great mental obliquity. Nothing stronger than luke-warm water should ever be applied to the eye, except by special medical advice, and under special medical supervision.

OBESITY AND HEALTH.—The tendency to accumulate fat is not a sign of good health. Nor of long life either. If a man or woman be above the normal weight, and the weight be rapidly increasing, it is not a favorable condition; since such a person is quickly making fat, and may convert tissues whose integrity is necessary to life, into the same materials. Especially in such is there a tendency to apoplexy, fatty degeneration of the arteries of the brain being often a cause of this disease; there is also a tendency to fatty degeneration of the muscular fibers of the heart.—*Herald of Health.*

THE TEETH.—It is known that the teeth decay more rapidly during ill health than when well, and Marshall Hall believes that long continued painful emotions cause the teeth to decay, as well as the heart to sink.

A MOUTH without grinders is like a mill without a stone. A diamond is not so precious as a tooth.—*Don Quixote.*

Useful Information.

Building Houses.

Every man who contemplates building a dwelling for himself, will make it a home, a hospital, or a grave for his family, according to his plan. The driest houses are the healthiest, hence those built of wood are the best; they are more liable to complete destruction by fire, but not more complete than iron or granite. Brick houses are the least injured by fire, because they neither melt, scale nor crumble. The damages to which they are liable may be prevented by two expedients. By placing a layer of slate or stone between layers of brick about a foot above the ground, the dampness from the earth is arrested, as brick soaks up water like a sponge.

The outer walls may be protected against the absorption of rain and fog thus: dissolve three-quarters of a pound of mottled soap in one gallon of boiling water, and with a flat brush spread it over the outer surface of the brick wall, while hot, without allowing it to lather; in clear, dry weather; next day dissolve a quarter of a pound of alum in two gallons of water, and paint it over the soap coating; the two combine and form a film of varnish which the rain can not penetrate. There should be a space of about an inch between the brick and the plaster. The old-fashioned comb roofs are best, as they shed water more rapidly, and give a garret, which protects the upper rooms from the heat of the summer sun. If possible, let the house stand east and west, the front facing the south, thus exposing three sides to the sun, and let the family room and all the habitually occupied chambers face the south, so as to have all the advantages of the warming, drying, and cheering influences of the sunshine. The house should be on an elevation, to allow the water to drain off in every direction. Plastered walls are cleaner than those papered; perhaps varnish is better than either, and is not so readily soiled, and is more easily dusted and cleaned from stains or grease spots.

Bare walls are dreary and barn-like. They can be ornamented with pictures and engravings, and thus made instructive, amusing and diverting to a very high degree. If frames are preferred, a very neat and cheap pattern can be made by getting a place of pasteboard and a glass of the size of the picture, which should be placed between the two, and a rim made to answer the purpose of a frame, as well as to keep all in place, by doubling over the edges a ribbon or strip of velvet. Ornamentation may go still further, and be made to afford quite as much pleasure to the eye as paintings, by simply placing a handful of heads of wheat in a vase of water. Each grain sends out bright green leaflets, and continues to replenish the fading ones for weeks together.

An exquisite transparency may be made by arranging pressed ferns, grasses and autumn leaves on a pane of window glass, laying another pane of the same size over it, and binding the other with ribbon, leaving the group imprisoned between. It is well to secure a narrow strip of paper under the ribbon. The binding should be gummed all around the edge of the first pane, and dried, before the leaves, fern, etc., are arranged; then it can be neatly folded over the second pane without difficulty. To form the loop for hanging the transparency, paste a binding of galloon along the edge, leaving a two inch loop free in the center, afterwards to be pulled through a little slit in the final binding. These transparencies may be hung before the window, or, if preferred, secured against a pane in the sash. In halls, a beautiful effect is produced by placing them against the side lights of the hall door. Where the side lights are each of only a single pane, it is well worth while to place a single transparency against each, filling up the entire space, thus affording ample scope for a free arrangement of ferns, grasses and leaves, while the effect of the light passing through the rich autumnal colors is very fine.—*Hall's Jour. of Health.*

GILDING AND SILVERING SILK THREAD.—In a process that has been patented in England, gold or silver leaf is rubbed on a stone with honey until reduced to fine powder. The silk thread is soaked or boiled in a solution of chloride of zinc, and after being washed it is boiled in water with which the gold or silver powder has been mixed. When washed and dried, it will be found coated with a fine layer of gold or silver, which may even be polished in the usual manner.

IN dressing for photographs, remember that dark brown, dark green, maroon and dark plaid goods without gloss, will give a rich drab color. Silks of the same color will take considerable lighter. Snuff brown, dark leather, dark drab, scarlet, cherry, dark orange, crimson and slate will also produce a drab color Violet, blue, purple, magenta and pink will take very light, and should be avoided. The hair should not be very wet or glossy.

ORNAMENTATION OF GLASS.—If a drawing be made upon ordinary ground glass with a mixture of boracic acid, gum and water, and when dry the glass be heated to a temperature sufficiently high to melt the boracio acid, the latter will render the glass transparent, and thus the drawings are fixed. Metallic oxides may be mixed with the boraoic acid, and thus any desired color can be imparted to the drawing.

How to Make a Good Bed.

Perhaps some housekeepers would like to know how they can make an inexpensive, and at the same time a good and durable bed, or mattress and bolster. I have a bed that will (with good usage) last a lifetime. It is merely a tick, the same as for straw, or husks, with openings in the upper side to insert the hand for stirring, and filled with cut paper. Now, reader, do not throw aside the paper with disgust, but, if for nothing but curiosity, finish the article, it will do no harm; possibly you may be induced to make one. The work of cutting the paper is not such a long job as you would think. Take any kind of clean paper (except straw paper) and fold it, or roll, so that in can be cut with one clip of the shears, and then cut it; you need not be particular as to the width. although the narrower it is cut the better. These clippings are like little curls or rings of paper, and lie almost as light as feathers, and after using the bed they will not break up and grow fine and dusty, but are clean, and can be stirred as light as when first used. I have heard people who have slept on them say "they were the best beds they ever slept on." I prefer them to feathers or common mattresses; hair mattresses are nicer, of course, but few of us farmers' wives can afford to buy them; whereas, the paper bed we can have without cost, except the work, and that the smallest child you have who can use a pair of shears, will help you, and if not kept busy too long at time, will think it but play. The same material makes nice pillows for lounges, chair cushions, cradle ticks, etc. I have a box to keep waste paper in, which is out of the way, and at the same time handier than the rag-bag; and when it is full, I cut them up into another box and put them into the tick. I use the same ticks that I have used for straw; wash them and sew up the openings, so they are just large enough for the hand to pass through readily; three openings are sufficient.—*Cor. Cincinnati Times.*

PLATE POLISHING POWDER.—The *English Mechanic* states that an excellent preparation for polishing plate may be made in the following manner: Mix together 4 ozs. spirits of turpentine, 2 ozs. spirits of wine, 1 oz. spirits of camphor, and ½ oz. spirits of ammonia. To this add one pound of whiting, finely powdered, and stir till the whole is of the consistency of thick cream. To use this preparation, with a clean sponge cover the silver with it, so as to give it a coat like whitewash. Set the silver aside till the paste has dried into a powder; then brush it off, and polish with a chamois leather. A cheaper kind may be made by merely mixing spirits of wine and whiting together.

TEST OF STEEL.—Geo. Ede says, in the *Iron Age*: Good tool steel in its hard state on fracture presents a dull, silvery appearance, is more close in its texture than annealed steel, and is of a uniformly white color with the entire absence of sparkling particles. If aquafortis be applied to the surface of steel previously brightened, it immediately produces a black spot; but if applied to iron the metal remains clean, so that it will be quite easy to select such pieces of iron or steel which possess the greatest degree of uniformity, as the smallest vein, either of iron or steel, upon the surface, will be distinguished by its peculiar sign.

To ascertain if a mineral contains copper, it is only necessary to pulverize a portion of it, dissolve it in strong nitric acid (aquafortis), and dilute a portion of the clear solution, which will probably be blue, until almost colorless, then add ammonia carefully. If copper is present the color will become an intense blue. In another portion of the solution, somewhat diluted, place a piece of perfectly clean polished steel or iron; in a few minutes the copper will be deposited upon the iron in a metallic state.

CARRIAGE SPRINGS.—Instead of using flat or elliptic springs an inventor uses a compound curved spring constructed somewhat on the principle of the *C* spring, and consisting of two or three springs connected together at their lower ends, while the upper ends which diverge are curved round and secured to any convenient part of the carriage framing.

MINERAL OIL may be detected by its property of imparting a flourescence to animal or vegetable oils, and by its aromatic odor in burning. The presence of resin may be ascertained by its giving a deeper color with nitric acid than that given by the pure oil.

RAWHIDE JOURNALS.—A correspondent of the *Scientific American* says: I have run a piece of machinery in rawhide boxes for fourteen years without oil; it is good yet and runs at 4,500 per minute. I put it in while soft, and let it remain until dry.

HERE is a Japanese receipt for keeping meat fresh in hot weather: Place it in a clean porcelain bowl and pour very hot water over it so as to cover it. Then pour oil on the water. The air is thus quite excluded and the meat is preserved.

THE metric system of weights and measures is to be made compulsory in all commercial dealings throughout the Austrian Empire from January 1st, 1877; and in the pharmaceutical establishments it is required this year.

TO TAKE STAINS OUT OF IVORY.—A little prepared white chalk, tinged with sweet oil and sal volatile into a paste; rub it on wet with a piece of wash-leather; let it remain until dry, then brush it off.

THE village of Yon Bet, situated about six miles northeast of Nevada city, was destroyed by fire on Wednesday last. The place contained bnt few business honses, which were totally consumed, save Fox & Oliver's store, and an old nnoccnpied building.

THE Inter-State Industrial Exhibition opened in Chicago on the 9th inst. It is in every particular far superior to the exhibition of last year, since all the departments are more complete and the decorations and fixtnres much handsomer.

AMERICAN INSTITUTE.—The fourth annual exhibition of the American Institute was formally opened in New York, on the 9th inst. The display in all departments is said to be more varied and extensive than in former years.

THE mills near Dayton are working to their full capacity, some on tailings, and others on nre from the Belcher and other Comstock mines. A large quantity of wood is piled upon the banks of the river, ready for shipment to Gold Hill and Virginia.

JAMES CONNERY, chief of the boiler department of the Baldwin Locomotive Works, has invented a new system of caulking boiler seams, and a naval commission has been ordered to examine and report upon its merits.

IT is rnmored that engineers are out to locate the line of the Southern Pacific railroad from Bakersfield to San Fernando, and that the company will soon commence active operations in the way of road building.

THE process of refining is now in full blast at the smelting works at Sacramento, employing some 20 men night and day. Smelting will be resumed at these works as soon as the new furnaces are complete, which will be in a few days.

CRES. JOHNSON discovered a lead of stone-coal about 28 miles south of Eugene city, on the East Fork of the Willamette, one day last week. The outcroppings indicate a rich depoit.

H. B. PLATT, the lessee of the coal mines near Ione city, will ship 500 tons to Stockton immediately. The vein is 10 feet thick and constantly improving.

A New Process of Working Black Sand.

We have received several letters of inquiry in relation to the process and machinery employed by the Perseverance Black Sand mining compsny to amalgamate the infinitesimal particles of gold and separate the fine or floured quicksilver from the black sand, which was noticed in this paper some weeks since. The President of the compsny has furnished ns with the leading features of the process, which will enable those acqnainted with such matters to judge of its merits.

The sand is first screened so as to materially reduce its bulk, and then snbjected for about twenty-four hours to a solution composed of canstic potash and common selt in proper quantities. This is for the purpose of removing any coating or oxide that may be upon the gold, and destroying sulphur and other base substances which would be absorbed by the quicksilver. to its injury. The pulp is then heated in a pan by a jet of steam (being constantly stirred), which takes but a few minutes, as it should not be too hot, and then the quicksilver is poured in and the steam and agitation continued from fifteen to thirty minutes, when the gold becomes thoroughly amalgamated, and the pulp is discharged into a vat to cool before puttiug it through the separating sluice. The heat has the effect of expanding or partially vaporizing the qnicksilver, and, aided by the agitation, distributes it all through the sand pulp in very fine particles, like flour, where it meets and amalgamates with the eqnally flue and universally diffused particles of gold.

Care must be exercised in the heating, as too much heat flonrs the qnicksilver more than is necessary to secure perfect amalgamation, and thereby increasee the difficnlty of collecting it together again without serious lose. When we consider the fact that the amount of heat required to raise the temperatnre of one pound of water from 32° to 212° will raise that of about 30 pounds of qnicksilver through the same range, the reason for thie cantion is obvione. There is reason to believe that most of our millmen have fallen into the common error of nsing too much heat in amalgamating the precions metals.

It is proper to state here that great care is taken to pnrify the qnicksilver, by proper means, before it is pnt into the puln, upon every occasion of nsing it, as success depends much upon having the quicksilver in good condition. Retorting alone ie not always sufficient, as some of the base metals volatilize and pass over with the mercurial vapor.

The last and most difficult operation is that of sep rating the fine particles of smalgam and quicksilver from the heavy black sand, and collecting them together agaiu without too great loss; for it mnst be remembered that black sand cannot be treated like quartz pnlp, on account of its greater specific gravity. The fine particles of gold and qnicksilver cannot be wholly precipitated by agitation or a concentrating motion, because they are so minnte and light in comparison to the grains of sand, that they will not settle by their own gravity through the heavy sand, as through qnartz pnlp.

This difficulty is overcome and separation secured without material loss, by this company, by means of a systeni of galvanized copper rollere, grooved spirally, and placed side by side and in layers one above the other, so as to "break joints" and not qnite touch together, and extending across the sluice, which is three feet or more in width. A soreen is placed over them to distribute the sand and water as they fall upon them, and a galvanized copper plate beneath to catch the qnicksilver as it drips from them. Two or three layers of these rollers are thus arranged at two or more places a few feet apart in the sluice, and drop riffleor wells are sunk across the bottom a little below the copper plates, to receive and retain the quicksilver as it runs off from them. The rollere are one foot in length, and one and a half inches in diameter and hollow, six or eight of which are laid side by side and end to end extending across the width of the sluice. These, as also the copper plates, are kept in a highly sensitized condition and free from verdigris, and as the pulp passes down over and between their multiplied surfaces it necessarily brings the fine particles of quickeilver into contact with some one of them to which they will adhere, before passiug through the whole of them as arranged in the sluice. Ae the quicksilver accumulates upon the rollers it drops from the under side, and the amalgam is cleaned from them in the same manner as from the platee.

Theee amalgamating rollers and their application to both the cradle and the sluice, are the invention of William Sublett of this city, who has applied for a patent therefor, and have been freely tested by the Perseverance company, who are about to employ them in exteneive operations in black sand mining at the month of Rogue river, where they have valnable claims. Now that a practical method of treating the anriferous beach sands of onr nortbern coast appears to have been found, we hear of other parties about to engage in this class of mining, which promises to attract great attention another season.

J. McM. SHAFTER will deliver the annual address before the Sonoma and Marin Agricultnral society this year.

Discovery of Sapphires.

Discoveries of varions kinds of minerals and precious stones have been made lately in the United States of Colombia, and that country will before long take a fair place among the mineral-producing regions of the globe. The placer mines in varions States are now yielding considerable gold, since the hydraulic process in vogue in this State is now extensively used there. Several American and English companies are working the hydraulic mines, and some of them are doing very well.

In a conversa ion this week with Mr. Morales, Colombian Consul at this port, he told us that several sapphires had recently been found in the State of Cauca. They were brought here by Dr. Weaver, and the man who found them told the doctor that there were many of these stones there. The lapidaries to whom the stones were shown pronounced them sapphires and valuable, but not of the right color to be very valuable. They thiuk, however, that if further search is made, sapphires of proper color to be of value will be found. These stones, which we examined, are a little too clear and light colored to be handsome. The two larger ones shown us would have been worth $500 each, if of a deeper color. One of about half the size, the lapidaries pronounced worth $50, even with the off color; eo the find is a g ood one, after all. The stones were found accidentally on the surface, and the ground will probably now be worked deeper, to see if darker colored sapphires cannot be found. The man who found them was not aware of their real value, nor was Dr. Weaver until they had been examined by the lapidaries. The sapphires were found in the State of Cauca, on the interior side from the western range of the Andes. They are genuine sapphires, but not of the proper color to make them very valuable. The stones are quite large, and will ehortly be cut and set. Sapphires are next in hardnese to diamonds. They are found in various colore, and are much admired, being of value according to the tints of the stone.

The Central Pacific Hospital.

The Central Pacific Railroad Co., that much abnsed corporation and "soulless monopoly," ought to have more credit than it receives for some things it doee. For instance, the company hae a fine hospital at Sacramento for the accommodation of the employees of the railroad, as well as for strangers who are hurt on the road. Half the time the passengers are injured by their own carlessness, or by non-compliance with the rulee of the company; nevertheless, they are taken in and cared for in the best manner possible by the Central Pacific people. The hospital is situated on G street, and the building is sufficiently large for the patients now there, and for many more. There is an air of comfort about the place not usually met with in public hospitals. There are no long faces, no pitiful complaints, and every want is met by skillful attendants. The library is particularly worthy of mention, and no doubt most of the convalescents bless the liberality of a company which providee for the comforte as well as the necessariee of life in such a place.

The ventilation of the building, the arrangements and style of beds, snrgical appliances, the kitchen, dining rooms, etc., all evince skill and judgment. The grounds are neatly laid out, and the place generally is comfortable, olean and pleasant. Mr. Forbes, the steward, attends faithfully to hie dnties, and the whole hospital is excellently managed, furnishing a pattern which others might follow with benefit.

THE fifth annual exhibition of Montana, under the auspices of the Agricultural, Mineral and Mechanical Association, commences on the Territorial fair grounds, near Helena, on the 14th inst.

A BAR of pure gold, weighing 312 ounces, was the result of eight days' run of an 8-stamp mill on quartz from the Cabell ledge, in Baker county, Oregon.

THE Virginia and Truckee railroad company will introduce the Westinghouee patent air brakes on their passenger coaches at an early day.

THE Gilroy Consolidated Cigar Factory manufactured 200,000, and shipped 250,000 cigars for the month of August.

THE Lyon county *Times* reports the discovery of about 200 acres of mineral coal land in El Dorado cañon.

THE Eureka mill, Carson river, worked about 6,000 tons of ore last month. This is the biggest run by the mill.

THERE are six wagon-making establishments in Petaluma, and all are busily employed at present.

THE water in Carson river is now very low and irregular in its flow.

A BLAST of 700 pounds of powder was pnt off in the American mine, at San Juan, on Saturday.

THE Creed & Butler mine, in Colorado, was recently sold to a Holland company for $3,000,000.

Class Exhibit—9th Industrial Exhibition.

Prime Movers—Water Wheels.

In our enumeration and notices of prime movers, we inadvertently overlooked "water-wheels," of which there are two exhibitors. Motive machines, as steam engines, water wheels and windmills are simply contrivances interposed between the power—the steam-boiler, the waterfall or the wind—and the work to be done. Their form and combination of mechanical principles is supposed to comprise the most economio and convenient means for taking up the power at d sposal and conveying it to the various appliances for performing the work required. Thus in the use of water there are various classes of wheels termed *overshot*, *breast*, *undershot* and *turbine* wheels, according to the manner in which the water is brought upon them. In calculating the power of a water wheel we multiply the weight of water by the hight through which it falls. Thus: 500 cubic feet of water (which weighe 30,000 pounds), falling through *one* foot of hight in a minute, repreeents, conventionally, one-horse power; 500 cubic feet falliog through ten feet per minute, represents ten-horse power; 1000 cubic feet falling through four feet per minnte repreeents eight-horse power, etc.

In any water wheel the power actually obtained from the water passing through it is only a certain proportion of the calculated power, from the fact that much power is lost by the shocks and changes of velocity which it experiences on entering and leaving the wheel, and by the friction on the journals of the same; also in the form of the buckets, the general construction of the wheel, the fastening of the arms, the axle, etc. In practical use the losses arising from the different forms of wheels are substantially about as follows: In the best turbines, from 15 to 20 per cent.; in indifferent turbines, 25 to 40 per cent.; in overshot wheels, 30 to 40 per cent.; in breast wheels, 40 to 45 per cent.; in the best undershot wheels—hardy-guidies with light work—50 per cent., and from 60 to 70 in others.

From this it will be seen that the turbine is the most effective form of water-wheel in use. Its compact form and small liability to get out of order, and ready adjustment for work, are also important advantages connected with its use.

There are but two exhibitors of water wheels in the Pavilion, both of whom exhibit turbine wheels only. Mr. Myers exhibits five of Leffel & Myers' turbine wheels, all of large, working dimensions; and Baker & Hamilton exhibit a small model of the Eclipse Double Turbine.

The turbine wheel was introduced into Europe about forty years ago, and from thence to the United States about ten years later. It was first known here as the Parker Turbine wheel, a modification of the European Jonnville. A turbine wheel differs essentially from any other in receiving and discharging water in all directions around its axis; and in the further fact that it loses but a mere moiety of efficiency when submerged. The modifications of this wheel are very numerous; not less than one hundred and twenty-five patents on such modifications have been taken out in this country alone within the last ten years. The Leffel wheel shown by Mr. Myers seems to have distanced all competitors in the reputation which it has secured, and in the numbers in use. Over 8,000 are now in use in the United States, of which 300 are enumerated in California and Oregon, and about 100 in Utah.

It is employed here for all sorts of work, as for running quartz mills, flour mills, woolen mills, saw mills, etc. It is constructed of various dimensions, from three or four horse-power up to three or four hundred horse-power. One of these wheels is the only power employed in driving the largest quartz mill on this coast—that of the Union Mill Company, on the Carson river. This mill—a double Leffel turbine—is only 52 inches in diameter, and is placed on a horizontal shaft—these wheels may be worked on either horizontal or vertical shafts—and uses 8,000 cubic feet of water per minute under 38 feet fall, which, according to the rule, gives it nominally a 600-horse power. It drives sixty 950-pound stamps, with 26 pans, 14 settlers, 8 amalgamators, besides pumping, hoisting ore, etc. Another, 13½ inches in diameter, working in a horizontal shaft on the Truckee river, is sawing 60,000 feet of lumber, daily, for the Nevada Lumber Co., working under a head of 120 feet.

The Eclipse wheel, exhibited in a very neat model, by Baker & Hamilton, is also a double turbine, differing somewhat from the Leffel. It is cheaper in price, and, according to the Lowell Reports on water-wheel trials, reaches a percentage of from 55 to 75 per cent. of the theoretical value of the water employed. It is estimated that there are about 1,000 water-wheels other than turbines in use on this coast making in all about 1,300. But the time will soon come when this number will be largely increased. No State in the Union promises such unlimited water-power as California, and the time is not far distant when this advantage will be sufficiently improved to make this the most important manufacturing State in the Union.

Machinery and Tools.

The range of industrial operatione or mechanical processes by which raw materials are

converted into things of use and value is wide and various. Yet nearly everything in this direction which we see or use, save some of the simplest forms of machinery and tools, has been devised within the last hundred years. Scarce a single century has elapsed since every thread used in the manufacture of cotton, wool, flax and silk, throughout the world, was spun singly by the fingers of the spinners, aided simply by that ancient and time-honored instrument—the domestic spinning wheel! In 1764 an eight-handed spinner—the "Jenny," sprang from the genius of Hargreaves. Two years later the more wonderful invention of Arkwright was brought out, and five years later, in 1774 *—just one hundred years ago*—the happy thought struck the mind of Crompton to combine these two ideas; and a machine was devised by which a hundred spindles were placed under the perfect control of a single person, but still turned by a crank. Soon after Kelley, of Lanark, substituted water for man power, which was in turn supplanted by the more subtle agency of steam, directed by the mighty genius of Watt. From these crude beginnings the more perfect and elegant spinning machines of the present day have gradually grown into existence, until now many thousands of spindles may be seen in a single room, drawing out, twisting and winding up with a degree of perfection which no human hand can attain, as many thousands of threads—a scene magical to the eye, producing effects that have revolutionized the world and made possible the existence of thousands on lands where tens only could have existed before!

The progress in the art of spinning may be taken as a fair example of the improvements which have been wrought in almost every other class of productive industry—whether in the house, shop field or mine. The rapid progress toward precision of execution and high finish made in the manufacture of all descriptions of machinery and the work done by the same, is what makes the past century the most wonderful of all the thousands which have preceded it. Volumes, nay a whole library might be written upon this subject by our best and most practical writers, and still not the one-half be told even of the past; but what of the future—who can tell?

A few brief observations in regard to machinery in general is all we have room for in this connection. Not the least among the recent advances made in mechanical and constructive science are those in respect to the increased perfection of workmanship manifested in the general arrangements of the parts of the machines themselves. This may be seen in many of the great variety of machines which are yearly sent forth to proclaim the new and constantly increasing triumphs of mind over matter, and has been in a large degree brought about by the American idea of making all the different parts of a machine interchangeable. This is what has made a Colt's pistol, a Remington rifle, a cheap and good "American watch" and a sewing machine practical. The success which has thus been introduced into a few specialties must eventually become almost or quite universal. It has already, within a few years, been introduced into several small portable engines—notably the Baxter engine, and into many agricultural implements. To effect such a result, in most kinds of machines, is impossible by the old method of hand work. Hence it often occurs that one of the first things an inventor has to do to render his invention practicable, is to invent another machine with which to manufacture that which he has just devised to perform some important service in the factory, shop or field.

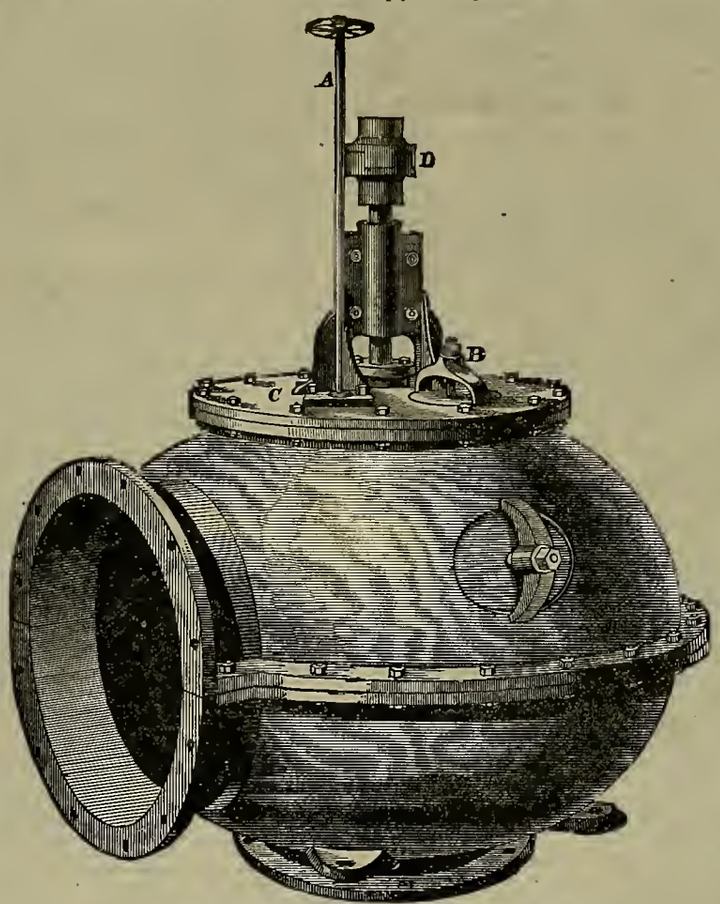
Until within 60 or 70 years nearly all finishing and shaping had to be done by mere manual labor. We were entirely dependent on the dexterity of the hand and the correctness of the eye for precision in all the details of a machine. We had no mechanical substitute for the human hand for applying and directing the motion of a cutting tool. It is only about 50 years since even so simple a principle as that involved in the *slide* rest introduced into tools and machines for the construction of machinery—a principle which is now almost universally employed for holding, applying and directing the edge of a cutting instrument to the surface of the work to be cut. By the use of this principle we are now enabled to cause the tool to so move along or across the surface of an object with such precision, that, without any aid from the hand, a workman is able to produce lines, planes, circles, cylinders, cones and spheres with a degree of accuracy which no amount of experience could give to the hand, and with an ease and rapidity wherein a single machine can represent hundreds of human hands. The same principle, in a modified form, is applied to every lathe, to the planing machine, the slotting engine, the drilling machine, etc., etc. Simple as is this device, its application in the various modified forms is of scarcely less importance than was the invention of the steam engine itself. Indeed, without it, the steam engine, in anything like its present perfection, could never have had an existence. What engineer would undertake to turn out a cylinder for one of our China steamers with nothing but a file as a substitute for a lathe?

It is to be regretted that so little attention has been paid to securing a proper exhibition of machinery at the present Fair. With the exception of the printing press, and machinery chiefly involving the use of saws for cutting, we find very little on exhibition in the way of hand or machine tools, or machinery for manufacturing purposes. The exhibition of agricultural machinery is very fine—the best ever made in the State. The show of pumps is also large and interesting.

Silk Manufactures.

This department affords but few articles of general interest. The only specimen of machinery for producing spun or woven goods is a single loom exhibited by A. Viannay, of No. 12½ Stockton street, who has there commenced in a small way the manufacture of silk dress goods. He shows one of his looms in operation near and just to the left of the main fountain. He also exhibits several pieces of dress goods woven by himself. They are very superior in quality, and deservedly worthy of attention. Mr. Viannay was formerly a silk weaver in France, and obtains his spun silk from the city of Lyons. He warrants his manufactures not to out or retain dust. They are made by the same process as the silk manufactured by the Bonnet Silk Factory of Lyons.

The California Silk Manufacturing Company, whose salesroom is at 566 Market street, make a fine exhibition of the products of their manufacture. We notice embroidery silk, buttonhole twist, machine silk dyed and ready for spooling, the same with gum extracted and ready for dying, and the same again exhibited on 100-yard spools. They also exhibit hair silk, and trim for weavers' and fringe makers' use. This exhibition shows that all the above



LEFFEL'S IMPROVED PATENT GLOBE CASING.

spun and twisted silk goods can be made here of as good quality as any which can be imported. Owing to the failure to produce the raw silk here, as above noted, this company obtains all its raw material from abroad—China, we believe.

The exhibit of cocoons, etc., which has presented such a marked feature at most of our former exhibitions, is now conspicuous only by its entire absence; thus we have absolutely nothing in the way of cocoons or the California product from the same, to show as the result of the many and costly efforts heretofore made to introduce culture of silk from the cocoons into this State. California is, beyond question, most admirably adapted for silk culture—so admitted universally by the best practical experts from abroad, who have studied our climate with reference to the matter. The finest cocoons exhibited at the Paris Exposition in 1867 were those from California. Notwithstanding the failure hitherto to make silk culture a permanent and growing business on this coast, we fully believe that the time will soon come when both the production of the raw material and the woven fabric will form an important article of California products. Its growth has no doubt been rather checked than otherwise by State aid, which led a few people into a disastrous speculative fever in the *morus multicaulis*, and the production of cocoons for the mere advantage of State premiums without any intention of building up the enterprise into a legitimate business. The reaction has fallen heavily upon the whole business, covering it temporarily with odium and discouragement; but as it has now come into the hands of a few earnest, plodding men, well acquainted with its details, it is confidently expected it will gradually come up from its season of folly and delusion. Honor and encouragement should be given to the few men who are now engaged in giving the business a fair, honest trial.

Silk manufacturing at the East, in all its forms—as sewing silks, ribbons, dress goods, fringes, etc., has already secured a firm footing, and has proven a most promising and lucrative business. New England, New York, New Jersey and the city of Philadelphia have a large amount of capital thus invested. May we not hope that the day is not far distant when the slopes and plains that skirt the western base of the Sierras will become as famous for their beautiful manufactures of silk, as the gorges of these slopes have long been for precious metals, and the valleys and plains for the gold-en grain that has fed and nourished the nations of Europe?

Barnes' Plaiting Machine.

Mr. Barnes exhibits a very ingenious machine, which attracts much attention, and which presents quite a novelty in devices for rope manufacture. It is really the novelty of the Fair, and is a right "jolly" piece of mechanism. The movements of the spools, in their gyrations and back and forward movement, remind one much of a set of automaton dancing figures. Ropes, as is well known, are made by simply twisting fiber into small strands and doubling up these strands upon one another by additional twists. The only change from this mode of manufacture which we have seen or heard of, until we met with Mr. Barnes' invention, is a machine which made a crochet stitch, and which could thus braid or crochet a covering upon a core and then increase the size of the cord or rope by adding other coverings indefinitely. But the machine here exhibited strikes out for something entirely new, and braids or weaves a perfectly round rope or cord, which may be composed of any desirable number of strands or smaller cords. The advantages of a cord so woven or braided are that it will not untwist or give out entirely when one or two strands have parted. It is so closely woven or braided that a rope will not ravel or unravel half an inch after being cut in twain, while the breaking of a strand, or even of several at different points, has very little effect in weakening the strength of the rope. A rope or cord made with this machine is not liable to tangle or work itself into inextricable knots while in use. For fishing lines, chalk lines, clothes lines, window or picture cords, this braided rope is unrivalled, and will endure twice, or thrice, as much wear as a twisted cord employed for such purposes, while its cost is only a small fraction in advance.

THE employes of the Crown Point mining company were paid off last week. The disbursements made by the Crown Point amounted to $90,000; Imperial, $16,000; Belcher, $83,000.

IT is reported that a remarkably rich development has been made in a gravel deposit near Grizzly Flat, El Dorado county, $5,000 having been taken out in a very short time.

Leffel's Improved Double Turbine Water Wheel.

There is perhaps no surer evidence of practical merit than success long established and widely extended, and based upon repeated trial upon the most exacting conditions. An invention of but little real utility may obtain a temporary reputation by means of shrewd management in bringing it before the public; but its deficiencies will inevitably come to light and a final verdict will be pronounced upon it in accordance with the facts. Cases in point are of almost daily occurrence, in which a transient popularity is gained by a device which will not endure the test of experience, and which speedily disappears from the market. It is therefore hardly too much to say that the fact that some 8,000 of the Leffel Double Turbine water wheels are now in successful operation, under heads varying from one and a half to 428 feet, and that the demand for them is larger to-day than at any previous period, constitutes the strongest possible evidence that it is what it is claimed to be by its inventor and manufacturers.

How the Wheel has Been Brought to Perfection.

No machine, however simple, durable and perfect in appearance, will in every respect prove satisfactory, when first put into operation; many parts will require perhaps a change of form, strengthening, or may be an entirely different arrangement, upon application to the work to be performed, and a trial of two or three years. In fact, it requires years of diligent study and practical experience, particularly with a water wheel, to so perfect all of its parts, as to make it successful under all circumstances, even though it be sound and practical in principle; of course many of them never can, by any amount of labor or attempted improvement, be made to operate all species of machinery, and must always remain but little better than worthless. To the general principle first stated, the Leffel Double Turbine has perhaps been no exception; during its introduction for the first four or five years, many of them were, no doubt, imperfect and not so durably made as all newly introduced machinery is necessarily. In short, the Leffel Improved Double Turbine has kept pace, from its first introduction, with the most advanced developments of mechanical science; and for any purpose for which the power of water is employed, it may be safely guaranteed as having no equal in utility, economy and durability.

An Improved Patent Globe Casing.

The next step in improvements was the invention of the spherical flume or pentetock, patented Feb., 1869, and now almost universally used in high heads, as it does away with much of the expense of setting the wheels.

The cumbersome pentstock, with its heavy timbers and large expense, is displaced by this tidy and neat arrangement, and the water conveyed to the flume by an iron pipe, costing but few dollars in comparison to the cumbrous construction of the old plan. Besides, being much cheaper than the old way, the spherical flume avoids all the objections to the old, as it being entirely constructed of iron, all the leaks can be entirely avoided and the wheel can be set anywhere in the mill. Being made entirely of iron it never rots, as did the planks and framework of the old style; and hence, with proper care, will last a lifetime.

The cut represents this new and improved iron penstock or casing, and in which many of the wheels are now placed. The form being that of a globe or sphere, it at once secures the greatest strength, with the least weight, and at the same time affords the largest space for the water to circulate above and around the wheel; while it also admits of the smallest exterior dimensions, and therefore occupies less space than any other form or shape that can be be adopted. As none of the parts are subject to wear or breakage, it never requires replacing, and of course its durability is beyond question.

JEFFERSON.—A private letter says the prospects at Jefferson river mines are becoming every day more encouraging; that many of the claims are being opened in a manner that will fairly test the ground, but as yet bed-rock has not been found. The river is now staked for sixty miles, and new camps are springing up every day. At the two principal camps, at the cañon, there are several hundred men; men are coming in and going out daily. As many as twenty business houses are in operation and projected, and if the present excitement should be justified by the prospects on bed-rock, it will be a lively place before winter. The writer does not advise those who have wages diggings to leave them for Jefferson river, as there is nothing absolutely certain as yet and will not be for some time to come.—*New North West.*

A. B. SCOTT, who has been boring for coal upon ranches near Lincoln, Placer county, a few days ago, at a depth of 55 feet struck a very superior quality of coal, the stratum being nearly 20 feet in thickness. The vein is not a mile distant from the Wilson mine, and quite near the railroad.

A PARTY of miners, Messrs. McIntyre, LeClair and two others, left Victoria September 2d, to prospect some creeks on the west coast of Vancouver Island. Two of the party have already been in the locality which the present party are leaving for, and found good prospects of gold.

Works of the Black Bear Company.

A correspondent of the Yreka *Union* writes as follows:

Leaving Sawyer's bar one morning, friend Grant and myself started down the North fork of Salmon river for a "swing round the circle," by which he proposed to take in the Forks of Salmou, the South Fork, Fairchild's, the Black Bear, and such other places as might come within the radius of our circle. At the Black Bear Mining Co's mill, a few miles from Yocnmville, all is life and animation. Everything moving and bnstling, the whole baviug the appearance of a lively little village. Going to the superintendent's office, we found Mr. Gould, and after a few moment's chat were joined by Mr. Rigby, who is now hnilding the new mill, and Mr. Farisb, the superintendent. After dinner we were shown over the works by Messrs. Farish & Gould. The works of the Black Bear Co. are by far the largest and most extensive of any company in the northern country, and comprise mill, chlorination works, saw mill, foundry, etc. The mill, when the present company bought it, contained but 12 stamps. As soon, however, as they came into possession of the property, they added an additional 16 stamps, making in all 28. Now they have taken down the old 12 stamps, and are erecting in their stead a new battery of 16 stamps, whicb will give them 32 stamps. The new addition is being built under the guidance of Mr. A. J. Rigby, a gentleman who has shown by his works that there is no better millwright in the State.

The new battery is being erected in a most substantial manner. The mortar beds are made of two pieces of timber 10 feet long and 30 by 48 inches and keyed together. These are stood upon end upon a foundation made of fine quartz dust, which is tamped down with hot irons, thereby making it as hard, and firmer, if possible, than rock. It takes four men a whole day to lay a half an inch depth of this dust. The space around the mortar blocks is then filled in with rock, packed carefully and closely together by hand, and the result is a battery, when finished, without the least possible jar. The 16-stamp battery now in operation is built in a like manner; eight of the stamps are fitted with revolving blanket troughs, by which the blankets are changed in a second. They were invented by a Mr. Patten, a gentleman in the company's employ. Tbe 32 stamps when running will crush 60 tons of quartz every 24 hours. The quartz is delivered at the mill from the mine in wagons which carry eight tons. These wagons when they arrive at the mill are backed np to the dump, the hind wheels blocked, a block and tackle suspended from a derrick, hooked on to the fore end of the wagon, which is then hoisted up and the rock slides out of the hind end in close proximity to the batteries. From here the quartz is fed into the batteries, and crushed into dust by the stamps, which are continually pounding away, the quicksilver in the batteries catching a good deal of the gold thus freed. Water flowing continuously through the batteries washes the powdered rock out through the screens and over the copper plates in front, which are also amalgamated, and catch most all the gold which escapes from the batteries. The stream then runs over long blankets, which catch the sulphurets and coarser particlee of rock. Tbese blankets are changed and washed about every 10 minutes. The blanket washings and tailings are then put into a Stevenson pan, which grinds them still finer; from this pan they run into a settler, from which, by constant stirring, the sulphnrets are caused to flow out and into two of Hendy's concentrators. These are vibrating pans, with revolving arms which keep the contents of the pan constantly stirred. The dirt flows out at the center and the concentrated sulphurets ont at the onter edge of the pan. These snlphurets are then ready for

The Chlorination Works,

Where the gold is extracted from them by a most interesting process. Upon reaching this department the sulphurets are first roasted in a large oven, where they are subjected to an inteuse heat. This oven has three hearths, two of which hold a ton each, and the third about six tons. While the sulphurets on the first hearth are being thoroughly roasted, those on the other two hearths are getting hot. When the sulpburets on the first hearth are roasted and taken out, those on the second hearth take their place, and a ton from the third hearth takes a place on the second. It requiree about 12 hours to properly roast a ton. This roasting process evaporates all the sulphur and arsenic. After they have been taken out and thoroughly cooled they are put into large vate. These vats are prepared somewhat similar to a filtering machine, by its having layers of gravel, from coarse to fine, placed therein. The roasted sulphurets are placed on top of thie gravel and the cover of the vat put on and sealed down tight. Chlorine gas is theu manufactured and turned on into the vats, wbere it is diffused through the sulphurets, and ite chemical action extracts the gold, which sinks to the bottom of the vat in a black liquid state. This is then drawn off and put in another vat filled with water, in which the gold is precipitated with muriatic acid. The gold, when taken from this laet vat, is of virgin purity. The chlorination process was not beiug used when I was at the mill, Mr. Farish having determined to endeavor to extract the gold from the snlphurets, after tbey have been roasted, with quicksilver. This is, however, only an experiment, made for the purpose of doing away, if possible, with the chlorination process, which is very costly. I have not heard as yet whether it has been successful or not.

In addition to the Hendy's concentrators, there are two large, old-fashioned buddles, which are likewise kept constantly at work concentrating tbe sulphurets. These are directly opposite in their operation to the Hendy machine, as they collect the sulphurets in the center and wash the dirt to the outside, the other machines doing just the reverse. Tbe company have here also a well-appointed little foundry, in which is cast the cams, shoes and dies used in the batteries, grate bars and other articles necessary ahont the mill or mine; also a saw mill, blacksmith shop, boarding-house, a brick office for the superintendent, and three or four neat private residences with tasty gardens, storehouses, stables, etc. The company have also a handsome flower garden, to which much care has been given, and of which Mr. Farish feels justly proud. The flowers therein are all splendid specimens of their species, and if not extremely ornamental, they are decidedly useful, being all of the cabbage variety, and nnmberiug about 3,000 heads; amonnting to about 8,000 pounds. The batteries, pan, settlers, concentrators, saw-mill and blower for foundry, are driven hy a hurdy-gurdy wheel 17 feet in diameter, with 250 feet pressure when there is plenty of water. When the water gives ont the motive is furnished by a 60-horse power douhle engine, the steam for which is generated in a boiler 16 feet long by 54 inches in diameter. The mill building is large and spacious, being 84 feet wide by 90 feet long.

The Mines at Bannock.

A correspondent of the Helena (Montana) *Independent*, speaks as follows of the mines near Bannock:

Shenon & Wadams are running tbree arrastras and one five-stamp mill on ore from the Wadams lode, located high up the mountain on the south side of Grasshopper creek, and the lode is from 3 to 30 ft. wide, and pays from $20 to $100 per ton. The ore is passed down to mill over a car tramway, 1,200 ft. long, the loaded car raising the empty one in regular succession. Phil. Shenon, the prince of quartz men, is engaged putting up machinery in the Butterfield mill, intending to run it on silver ore. It will be in rnnning order this fall. Mr. Wm. Purvine is introducing a new silver amalgamating pan (patent applied for), with concave top, calculated to force the rising pulp back to the center of the pan—an undoubted improvement on the old pan now in nse. Mr. Shenon is one of the most successful as well as one of the most enterprising quartz men in the country, and has good ore enough in sight to keep his mill running for years.

In the way of women's rights I have a few notes to make. Mrs. Wadams, a lady who has sons and daughters growu to man and womanhood, and a pretty little three-year-old baby, did all the work of running three arrastras last season, the proceeds from which amounted to more than $10,000, has charge of the same this season, and has fonnd time to collect one of the finest mineral cabinets in the Territory.

The Dakota lode, near Mayville, and one of the finest discovered in Montana, is now being worked by R. Bayles, and recently, at the depth of 80 ft., a large body of good ore was found.

Ore is now being taken from the St. Paul lode, near Banuock, and Merry's arrastra is supplied from the mine. Carhart's mill runs regularly on ore from Dakota No. 7, and hard ore from the St. Paul and other ledges.

PETROLEUM IN VENTURA COUNTY.—The production of petroleum in Ventnra county promises to become, at no distant day, one of the most important industries of that county. New and important discoveries are being made from time to time, and capitalists in San Francisco and other places are organizing for the development of the various oil springs. A few weeks ago some new springs were discovered in the north-eastern part of the county, on a branch of the Sespe, ahont twenty miles from the coast. They are situated on the bank of a gulch, and within a distance of three quarters of a mile there are at least one hundred flowing wells, from which tbe oil flows in such immense quantities that it stands in pools in the gulch, from one to three feet in deep. It is estimated that there are now at least 150 barrels of good oil in the gulch which could he saved without any trouble. By opening the springs, it is believed their capacity could he increased to 100 barrels per day. They have been taken up hy a party of gentlemen from San Francisco, who will commence operations at once.

THE NEW BOULDER DITCH.—We are informed that the grading and excavating on the new ditch on upper Boulder has been completed. There are 600 ft. of flume to be erected, when the ditch will be ready to turn water into; but the owners do not expect to more than get it into good running order this season. It is about three miles in length, five ft. wide on top, four ft. on bottom and two and a half ft. deep. It has a grade of one inch in twelve ft. It will carry all the water in the Boulder at ordinary stages. The ditch is constructed to carry water upon the high bars near the mouth of Alta gulch. The bars prospect well, and as there will be an ahundance of water during the entire mining season, it is confidently predicted they will pay largely. Mr. John McDermott is one of the lucky owners and is superintendent. We are pleaeed to learn that Johnny has a good thing in eight. He is a rustler and deserves success.—*Helena Independent.*

Is Mining a Legitimate Business?

We have often beard the assertion made tbat mining was not a legitimate business hut simply a speculation. We beg to differ with all who are inclined to entertain this belief. There is really no foundation for the assertion that mining operations are purely speculative. We have watched quartz mining almost from its incipiency in America, and we have seen less failures in that branch of business than any other, where experience, judgment, capital and business tact have been brought into requisition.

We are aware that there are idle mills and smelting furnaces throughout the entire mining regions of the Rocky mountains and Pacific coast, but before condemning mining as a legitimate branch of industry would it not be well to inquire why so many reduction works are lying idle? There is a cause and a good one too. Capitalists, and in many iustances men without capital, but with plenty of cheek, have erected mills and furnaces without regard to location, accessibility to mines, or other surroundings. Furnaces have been built remote from mines, charcoal, flux, etc. Mills bave been erected a great distance from mines; at points almost inaccessible to the mines of a district; at places where wood and water were scarce, and finally where there was not sufficient quartz in sight to justify the erection of an arastra. The result has been disastrous to the reputation of the mines and to the finances of a majority of the projectors of the works. Would a good business man anticipate a different result? We think not. We are of the opinion that a shrewd man would not build and furnish a first-class hotel in a locality where there was neither regular or transient patrons, and only a bare possibility that there ever would be any. No sensible merchant would build a fine wareroom and fill it with a large stock of goods, at a point where there were bnt half a dozen persons and no probability that there ever would be any more. Yet these are analagous cases.

But there are still other causes why many quartz mining enterprises have proven disasterous. Good mills and furnaces too have been erected where quartz was both rich and abundant, and all necessary adjuncts to successful reduction easily obtainable. Many of these have also proven an incumbrance to their owners. The explanation is easy. These works have been managed by men who had no knowledge, or at least but an imperfect knowledge of reducing ores. Another class of superintendents are those who lack business or financial ability. Surely no sane person would trust his life in the hands of a quack doctor, a litigant an important case to a numbskull lawyer, nor business man his affairs to a clerk whom he knew to be incompetent to discharge the duties assigned to him. Yet these identical persons will purchase a quartz mine, erect a mill or furnace and employ a man to run it who knows comparatively nothing about the kind of machinery required or the process necessary to make the ore pay. They give the mill a trial and in three cases out of five there is bitter disappointment. Without stopping to investigate where the fault lies, the stockholders meet, declare that the mines are worthless, appoint some man to look after their property, and there the matter rests.

But there are some thoroughly competent business men and experienced manipulators of ores who have charge of reduction works who fail. It is not their fault. It is the fault of miners. They mislead themselves by having picked specimens of ore assayed and upon that basis take out a few tons, have it reduced at a good mill, where it does not yield according to their exalted ideas, based upon the aforesaid assay, when they declare they have been swindled or that the mill is worthless, throw down their mining implements and wait for some one to buy them out. The result is there is no rock to crush and the mill stops.

One of the principal reasons why so many mines have not met the expectations of their owners is that they have been managed badly. Incompetent managers employ less competent men to work the mines, who go at it in such an unskillful manner that the cost of mining the ore is more than double what it should be. Notwithstanding the fact that there have been so many failures in mining, the cause thereof can generally be traced to mismanagement. In looking at the matter dispassionately we are surprised, not that there have been so many failures, but that there have been so few. We firmly believe that when men use the same calm judgment and business tact in mining enterprise that they do in other pursuits, mining will become as safe and profitable an investment for capital as merchandising or banking.—*Helena Independent.*

NEW MILL.—Col. Smith's new quartz mill at the head of Indian creek, Jefferson county, is being constructed rapidly. We understand that Mr. Smith intends having it completed by the 1st of October. He has a number of men at work taking out quartz, and has a large quantity of rich ore now on the dump, which is said to be the richest lot of gold quartz in the Territory. The first month's run, it is predicted, will yield sufficient bullion to pay the expenses of erecting the mill and all developments made on the mine up to this time. We trust that these anticipations may be realized. There are a number of lodes that prospect well on Indian creek, and the probabilities are that if Mr. Smith makes a success, others will be induced to develop their mines.—*Helena Independent.*

Mining vs. Farming.

In many sections of the valley the farmers are undoubtedly much injured by the settlement thereon of sediment from the mines. For a time the farmers seemed to regard this as a natural consequence — an injury directed against them by the hand of Nature, which was beyond their power to control. At last they seem to be waking up to the fact that it is not the direct hand of Providence which is sending this sediment down the rivers, to settle upon and destroy their ranches, but that it is a lot of miners—hard working men like themselves, who are shoveling away the mountain sides, and sending the sediment down to injure them. They no sooner, apparently, find out that human hands are the cause of their trouble, than they set about to find a remedy. The farmers of Linda township, in Yuba county, seem first to have conceived the idea of securing reparation for the damages they sustain; at least they are the most active in their endeavors to obtain either a remedy or a preventive. They have had much to say on the matter heretofore, and to-day, we understand, they hold a grand mass meeting in the City Hall, at Marysville, for the purpose of inaugurating a move for obtaining compensation for the amount of damages sustained. They may be successful, and they may not. It is a difficult matter. They may provide, or he the means of having provided, some measure, securing compensation for losses thus sustained, but they can never stop mining. The miners are not, as a class, desirous of injuring a single farmer, because they have sense enough to know, the more farms, orchards and gardens there are to produce food, the better off will be the mining industry. But, as the Grass Valley *Union* suggests: "The world wants gold, and more of it than is now ont of the ground, and to supply that want many mountains will yet be washed away, and thousands of quartz ledges will yet be pounded into sand."—*Placer Herald.*

A NEW FUME ARRESTER.—A portion of the iron for the new fume arrester at the furnaces of the Eureka Consolidated Company, now in course of erection, arrived yesterday, and will soon be put in place. The carpenters are now engaged in building a substantial trellis work leading from the furnaces to the side of the hill in the rear, a distance of 200 feet. On this the iron flue will be placed and continued up the bill to the stack, 400 feet distant, which will also he constructed wholly of iron. It will require 50,000 pounds of this iron for the flue, which has been manufactured at Pittsburg, Pennsylvania, to the order of the company, coming ready to be riveted and put in place. Although the building of the flue is accompanied with a large outlay, it will pay for itself in three months' time by the saving of hullion now wasted. The remaining portion of the iron will arrive next week, and the work completed some time in September. A considerable delay is occasioned by the action of the Central Pacific Railroad Company in refusing to unload the iron at Palisade until after it had been sent through to Sacramento and returned. What profit a railroad company can gain in so doing is beyond our ken, but it is doubtless owing to the through freight war now raging between that and the Union Pacific Company.—*Eureka Sentinel.*

TROY DISTRICT.—From Mr. Davies we learn that the recent developments on the Bine Eagle and Troy ledges are of the most enconraging character. The company, after years of diligent search and expenditure of nearly $500,000, had become nearly despondent, and were considering the question of abandoning the whole enterprise, when in the prosecution of some new work, a vast deposit of high grade ore was discovered in the lower workings. These disclosures have had the effect to restore confidence to the company, and an additional capital of $60,000 was at once subscribed with which to carry on operations. The fine 20-stamp mill and Stedefeldt furnace will probably be started this fall, but not until the accumulation of 3,000 tons of ore shall have been raised from the mines of a quality that will assure a profit. This has been one of the most solid and energetic mining associations which England has furnished to the Pacific slope. It is formed of wealthy men of Lancashire, who have been most liberal in arming the local management with the sinews of war.

GONE PROSPECTING.—The steamer "49" has been accured for the purpose, and a large number of men have left Colville in her for a prospecting tour in the Arrow lake country, situated up the Columbia river from 100 to 200 miles above old Fort Colville. The men are to be dropped along the route at different points, and the steamer will make occasional trips up and down to carry supplies of provisions and to bring the prospectors back to Colville when they wish to return home. It is expected that the country will be thoroughly prospected, and it is confidently hoped that good mines will be discovered, as it has long been believed there were rich mines somewhere in that country. It is the intention of the prospectore to remain in the field as long as the weather continues favorable, provided they do not "strike it" sooner. *Walla Walla Union.*

THE members of the Austrian Polar expedition, for whose safety fears were felt, have been heard from. They were shipwrecked, took to sledges, and succeeded, after a long journey, in reaching the Norwegian island of Wardoe.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The ebrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales. Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 872 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. lambp

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. RUCKER, M. D.

A MAMMOTH FREE PAPER.

—THE—

MECHANICS' FAIR

DAILY.

Having been awarded the publication of the Daily Newspaper in the Pavilion during the Fair of the Mechanics' Institute of the City of San Francisco, commencing August 18th, 1874, we would respectfully announce that no efforts will be spared to issue a

LIVE AND DESIRABLE SHEET.

Its immense circle of readers will include all adult visitors at the Fair, embracing during the exhibition a large proportion of the most intelligent, energetic and influential citizens throughout the Coast.

Advertisers will secure the best terms and space by handing in their orders early.

ARE YOU GOING TO PAINT?

THEN USE THE BEST.

THE AVERILL CHEMICAL PAINT

WILL LAST THREE TIMES AS LONG as the best lead and oil, without CHALKING; is of any desired color. It is prepared for immediate application, requiring no Oil, Thinner or Drier, and does not spoil by standing any length of time. It is equally as good for inside as outside work; over old work as well as new; in fact, where any paint can be used the AVERILL CHEMICAL PAINT will be found superior to any other. Any one can apply it who can use a brush, which truly makes it the FARMER'S FRIEND.

IT IS JUST THE PAINT FOR THE AGE.

IT IS SOLD BY THE GALLON ONLY.

One gallon covers 20 square yards 2 coats.

For further information send for sample card and price list.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

Chromium.

Owing to the newand extensive discoveries of the ores of this metal in this state, public attention is becoming interested iu the matter, andwe are beset with inquiries as to what it is, wbat it is used for, etc. Chromium is one of the elementary substances of whioh our earth is composed, and receives its name from the property of imparting beautiful colors to its compounds. Like iron and lead, it is never found in nature in its metallic state, bnt always ohemically combined with some other substance. It unites with oxygen in several different proportions, and when so united the compound possesses the peculiar properties of an acid, and combines with various metals as bases, forming salts of different colors. Chrome-ironstone is the principal ore of chromium, and is a compound of oxide of iron end sesqui-oxide of chromium. The familiar bi-chromate of potassa of commerce is obtained by heating chrome-ironstone with chalk and carbonate of potassa in a reverberatory furnace; the product is digested in water, and the yellow solution separated from the insolnble matter; nitric acid added to the solution precipitates part of the sibca present, after which the liquid on evaporation yields crystals of bi-chromate of potassa, a salt tbet is extensively used in the arts. In photography it is the basis of most of the printing processes, on acconnt of its property of rendering gelatine insoluble by exposure to light. In dyeing it is used extensively as a mordant. It is the material from wbich chromic oxide, chromic acid and most of the metallic chromates are prepared. Chromic oxide is the most insolnble green pigment known, and is extensively used in printing bank notes, staining glass and painting porcelain. The chromates of lead, bismnth, baryta, strontia and zinc are employed as pigments, varying in tint from the vermilion red of the basic chromate of lead, to the pale yellow of the strontia salt. It is comparatively but a few years since the element chromium was discovered, and really hut a few years since its compounds have been of any value in the arts. The most interesting use to which it has been applied is in the manufacture of the celebrated

Chrome Steel,

To wbich we have before called the attention of our readers.

The St. Louis *Republican* of recent date, in a long article on chrome steel, says: "The introduction of crucible cast steel by Huntsman & Heath in England has revolutionized the steel-making bnsiness of the world. Blistered and shear steel which bad before held the market, had to yield to the steel made by the crucible process.

"The great desideratum to be achieved in steel-making is tenacity and hardness. Hardness alone is not a desirable quality in metal. Tests made with chrome steel sbow it to have the requisite qualities of the best metal, viz.: elasticity, tenacity, ductility, malleability, hardness and temper; indeed it can be tempered to almost any desired limit * * * * * * There is now but little doubt tbat the use of chrominm as an alloy with iron in the manufacture of steel will revolutionize the whole art and business of steel-making."

The St. Louis *Railway Register* in speaking of the great St. Louis and Illinois bridge says: "Some of the best engineers in this country and in Europe were engaged with Capt. Eads in testing the material which was to enter into the construction of the bridge. After the most thorough scientific tests it was found that chrome steel met all the requirements of the case, showing the highest tenacity under tension and ntmost refractoriness under compression. It was therefore selected as the best, most uniform, homogeneous and tenacious steel that could possibly be made for the purpose. All except 18 pieces, these some of the great anchor bolts, of the material used in the superstructure of the bridge is chrome steel, made by the Haughian process belonging to the Brooklyn Chrome Steel Company." To those who are interested in this new article, which is being rapidly introduced on' this coast, we would recommend the examination of the specimens now on exhibition at the Mechanics' Fair.

Inasmuch as we have chrome ores and iron and coal in this State, it would seem as thongh we ought to make our own chrome steel, as its importation will ere long be very great.

We nnderstand that there is a company already organized for making pigments from our chrome ores.

Matting Furnace. — Ground was broken yesterday for the erection of a Matting furnace, to be put up at the Hoosac smelting works, wbich, when completed, will enable the manager to receive and work all milling ore that may be brought to the furnace for reduction. By the use of the Matting fnrnace the heavy lead from the Hoosac mine can be worked advantageonsly with the rich quartz ores from Newark and Silverado districts, and the Geddes and Bertrand mines in Secret cañon. The furnace is to be constructed on the best approved plans, and by its use a perfect separation of all silicifernus substances will be obtained in conjunction with the present blast furnance with alkali from the Ruby bill ores. The Matting furnace will be completed about the 20th of September.— *Eureka Sentinel, Aug.* 28.

California peaches are selling in New Mexico at $1.50 per dozen.

Chrome Steel.

At the npper end of the Pavibon is a display of Chrome steel, made by Huntington, Hopkins & Co. It is only lately that this steel has been introduced on this coast; but it seems to heve filled a demand long felt, judging from the testimonials of prominent mechanics in its favor. We examined several bars of this steel which had been twisted while cold, and which were quite uninjured by the operation. This steel is an alloy of two metals, iron and chromium, and besides being far in advance of anything hitherto known for strength, durability, elasticity and nniformity, it possesses some features exclnsively its own. It bas been applied to almost every purpose known to mechanical ert, and has uniformly proved a superior article.

The steel, being an alloy, is capable of being graded for any special purposes. It can be made so hard tbat you can not soften it, and so soft that you c an not harden it. One grade is made for turning and planing tools; another for taps, dies and punches; and another for cold cbisels, ro k drills and tools for rock work, etc. It is not injured by being heated to a very high heat. If heated to nearly a white heat and allowed to cool gradually, it is the same as it was before being put in the fire Two grades of this steel will weld like wrought iron. The only way the steel can be spoiled is by being dipped in water or hardening mixture at too bigh heat, and even then it can be restored by being reheated and dipped at the proper heat.

The word "chrome" is not, es many suppose, a trade mark; bnt a metal which is alloyed with iron for tbe purpose of obtaining the different degrees of hardness, and, owing to its great affinity for iron, it can not be other than uniform. The steel for the spans of that great engineering work—the St. Louis bridge—is made by this cbrome process. This chrome cast steel has a tensile strength far exceeding that of any other. In a series of experiments, the bighest tensile s'rain obtained was 198,970 pounds to the square inch; the average result of 12 specimens was 179,980 pounds, whilst the highest strengtb of steel given in Percy's Metallurgy, page 870, is 132,909 pounds per square inch.

One grade of this steel, called Adamantine, wben forged into a tool and allowed to cool gradually is too hard to be worked with a file. "Gun steel" can be worked almost as easily cold as wrought iron when hot. There are several other grades running between these two extremes. We saw the other day at the Fair a cold chisel which had been heated to a welding heat, then split or spread apart and plunged into water and cooled. Then heated to a welding heat again, hammered together without a flux and brought to an edge in the weld, ground and made a first-class cold chisel. It shows the mark of having been sliced half way up the handle.

This steel is used on all the principal railroads of the East, and the Central Pacific company on this coast uses large quantities of it. In this city it is in use at all of the principal foundries, and they express themselves well satisfied with the results. It is being rapidly introduced in the mining districts of the coast for rock work, such as drills, picks, etc. Dynamic tests of this steel, made at the West Point foundry, the highest strength of the 12 specimens being 198,910 pounds; lowest strength, 163,760; average of all the specimens, 179,980, or about one-third more than Percy in his "Metallurgy of Iron and Steel" gives as the highest tensile strength attained by steel.

Death of A. Delano.—We learn that this old resident of Nevada county died at Grass Valley on Tuesday night, after an illness of several days. He was a banker at that place, was also interested in mining, and was known by reputation throughout the State as an author and a man of integrity. He was the author of a volume published in the East in 1854, entitled, "Life on the Plains and at the Diggings," being scenes and adventures in an overland journey to California; also of "Pen and Knife Sketches," "Old Block's Sketch-book," the two last published at this office; and likewise of innumerable newspaper articles, sketches and stories. He was a writer of much native humor and plainness of speech, abounding in facts, anxious to do justice to all and injury to none. His character was that of an upright citizen, just and honorable in his dealings, and his daily deportment was such as to command the respect and secure the regard of all with whom he had communication. He left b-hind him a family and a host of friends, who will long remember him as an affectionate relative and most valuable associate.—*Sacramento Union.*

The quicksilver discovery on Dry creek, being opened by Heushaws and others, says the Mendocino *Democrat*, is making a handsome showing. Two hundred tons of rock were taken out by five men in 10 days, and the pile has been estimated as likely to yield about $40,000.

The State Fair.—Applications for space in the State Fair pavilion, at Sacramento, and in the building for agricultural implements, at the park, are said to be coming in quite rapidly.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Vice-President Hewston in the chair.

The following gentlemen, having been duly proposed, were ballotted for and elected to membership of the Academy: B. F. Sherwood, life-member; Charles M. Blake, Charlee Sonntag, Frederic T. Newberry, Abel T. Winn, Frank P. McLean, Charles W. Brooks, James A. Waymire and B. R. Swan, resident members.

The additions to the museum comprised a collection of shells from Tahiti, embracing 338 specimens, presented from Captain M. Turner; specimens of the porcupine fish, from the Society Islands, also presented by Captain Turner; curious deposi s from a mineral spring in Lower Cali ornia, received from David Turner, United States Consul at La Paz; a de-p-sea crab, of enormous size, from the office of the United States Coast Survey; jar of alcoholic specimens of fish, from Captain Lewson, of the Coast Survey; species of eel, from Captain Scammon, of the Revenue Service; two aquatic birds, mounted, from E. F. Lorquin; specimens of crustacea, from Mr. Burling; curious larva cases, collected in a creek at Sancebto, from John H. Turney. The usual quantity of regular scientific publications, for the library, was received from correspondents of the Academy.

The sixth and seventh of the series of valnable pepers on Pacific Coast *Lepidoptera*, by Henry Edwards, were received and referred to the publication committee. A paper from Stephen Powers, a corresponding member, entitled "Aboriginal Botany," was read by the Secretary. It described the various herbs used by the Indians of this coast for food and medicinal purposes, the method of prepering them, and the virtues they are supposed to possess as remedial agents. We shall give a synopsis of this interesting paper in our next week's issue.

Land Decision.—Copp's *Western Landowner* contains the following ruling from the General Land Office: An applicant for a patent nnder the mining laws may abandon from his application a portion adversely claimed by another party, and after the survey receive a patent for the part not in controversy. Examination of an application for a patent under the mining laws shonld proceed beyond the papers filed in the case, and into those general records of the General Land Office which are evidence of the final disposition made of the public domain; and if it is fonnd that any part of the premises applied for have been previously disposed of, an express exception thereof in a subseqnent patent. Land when once appropriated under the homestead law, is thereunto removed from pre-emption settlement and homestead entry, and can only be again subject to them by a cancellation of the homestead entry in the manner prescribed by law. Such cancellation becomes effective at the date of receipt of the order thereof, at the local office. To institute a valid right under the pre-emption law to a tract of land covered by a homestead entry, some act of settlement must be performed by the pre-emptor subsequently to the cancellation of said homestead entry.

Dried Potatoes.—Potatoes, cut and dried, are coming into favor East. They lose 84 per cent. of watery elements, consequently a ton is reduced in weight to 352 pounds. Thus dried, potatoes keep indefinitely. They are in demand for ship's stores and for inland places where freight is expensive, as in mining districts. By immersion in water over night they resume near'y their original bulk, without perceptible loss of flavor.

Improving the San Joaquin. — Lieutenant Weeden, of the United States Corps of Engineers, visited Stockton on Wednesday of last week, for the purpose of looking over the San Joaquin river from that place to Antioch, and of making a report to the Government on the probable cost of improving the navigation of the stream. He will probably put on a party of engineers to make a detailed survey before reporting on the matter.

The Sacramento beet sugar company are making arrangements to add to their works a distillery for the manufacture of rum, intending to thus use up a quantity of syrnp not desirable for the manufacture of sugar. A number of large vats and other material recently used at the Calistoga distillery have been procured, and it is expected that the works will soon be in operation.

Flour Mill Burned.—The Antelope flouring mills, situated about six miles from Red Bluff, owned by J. S. Coue, and rented by T. R. Ryan, were destroyed by fire on the 31-t ult. Loss between $40,000 and $50,000. The grain and flour were partially insured. There was no insurance on the mill.

Farm House Burned.—The residence of John Thompson, a farmer, living in Pajaro valley, was burned to the ground on Sunday morning last. The loss is about $5,000; no insurance. There were eight hundred dollars in coin in the house at the time of the fire which at last accounts had not been recovered.

Grapes for Wine.—Eberhardt & Lechman have purchased, for wine making in Sacramento, the vast crop of grapes on the ranch of Jeff. Nickerson, Placer county.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Aug. 25th, 1874.

For Week Ending Aug. 11th, 1874.

Extra Seat for Cars, Carriages, Etc.—Chas. E. Baldwin, San José, Cal.

Hydraulic Jack. — Edward Biddle, Carlin, Nevada.

Car Coupling.—Harrison E. Smith, Portland, Oregon.

Gold Leaf for Dentists' Use.—Chas. E. Blake, S. F., Cal.

Piano.—Christian Boerner, S. F., Cal.

Medical Compound or Bitters.—John Philip Edinger, Santa Clara, Cal.

Overalls.—Jacob Greenbaum, S. F., Cal.

Egg Carrier.—Joseph Perkins, S. F., Cal.

Traction Vehicle.—Clinton V. B. Reeder, San José, Cal.

Balance Slide Valve.—Andrew J. Stevens, Sacramento, Cal.

———"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Mining and Scientific Press,

(Established in 1860.)

The oldest, largest and best Mining Journal. Devoted, also, to Science, Invention, Mechanic Arts and Industry on the Pacific Coast.

Subscription to the above, $4 a year; Sample Copies, post paid, 10 cts.—four for 25 cts. Address,

DEWEY & CO., Publishers,
No. 224 Sansome st., S. F.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. McCarty—General Agent.
W. H. Rattenberry—California.
Chas. W. Otis—Contra Costa County.
Chas. T. Bell—Alameda, Santa Clara and Santa Cruz Counties.
J. W. Anderson—Orange and Santa Ana, in Los Angeles County, Cal.
Hoon Alston—San Luis Obispo, San Bernardino and San Diego Counties.
Jas. Kearney—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. Goodwin—Sacramento County.
S. G. Crawford—Nevada, Sierra and Plumas Counties.
J. G. Kelley—For Washington Territory.

Agents Wanted to canvass every town on the Pacific Coast for the Mining and Scientific Press, Pacific Rural Press, and the Illustrated Press. Experienced canvassers preferred. Good men can make large wages besides learning much and improving their talents

DEWEY & CO.,

American and Foreign

Patent Agents.

No. 224 Sansome St.

SAN FRANCISCO.

Patents Obtained Promptly.

Caveats Filed Expeditiously.

Patent Reissues Taken Out.

Patents Secured in Foreign Landa.

Assignments Made and Recorded in Legal Form.

Copies of Patents and Assignments Procured.

Examinations of Patents made here and at Washington.

Examinations made of Assignments Recorded in Washington.

Examinations Ordered and Reported by Telegraph.

Interferences Prosecuted.

Opinions Rendered regarding the Validity of Patents and Assignments.

Rejected Cases taken up and Patents Obtained.

Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.

Send for Circular.

Every Mechanic should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Mining and Scientific Press office, S. F. Bound in cloth. Price (very low), post paid. $1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for refereuce.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies 25 cts

THE PACIFIC RURAL PRESS, a sixteen-page agricultural paper published in San Francisco, is alive to all interests pertaining to stock and agriculture.—*Appanoose Times, Centerville, Iowa.*

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

GENERAL MERCHANDISE.

WEDNESDAY M., Sept. 9, 1874.

Bags have steadily declined for some time past. Prices are now much lower than a few weeks ago. The demand this season has been great, but strenuous efforts have been put for th to meet it, and now the market is weak even at present rates. Wheat Bags would be more in request were the tendency to ship Grain greater. Offices are still slow of sale. Oils are weak. Tobacco is buoyant, at the advance

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenlurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is uucqualled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially or the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $6 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file their PAPERS. lamhp

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other loda matter;—galena and silver sulphurets from pyrites, baryta end quartz; and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.

At Denver, Colorado. Lock-Box 2225, or 243 Sixteenth street. ag8-16p

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of August, 1874, an assessment of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of November, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

F. H. WELLS, Secretary.

Office—No. 402 Montgomery street, room No. 23, San Francisco, Cal. sep5

Eagle Quicksilver Mining Company.—

Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—Is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 18 4, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 8, No. 302 Montgomery street, San Francisco, California. Any shares upon which said assessme t shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H WATSON, Secretary.

Office, Roome 5 and 8, No. 302 Montgomery street, San Francisco. jy-25

El Dorado North Mining Company---Location of principal place of business, 215 Sansome street, room No. 2, San Francisco, Cal. Location of works, Philadelphia District, Belmont, Nye County, Nevada.

Notice is hereby given, that at a meating of the Board of Directors, held on the 4th day of August, 1874, an assessment (No. 1) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 215 Sansome street, room 2, San Francisco, California.

ap25-tf

BALL'S
SWEEPING DREDGE,

A NEW AND VALUABLE
CALIFORNIA INVENTION,
Hae been very lately well proven by per forming a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that bas ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported hy leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus drodged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

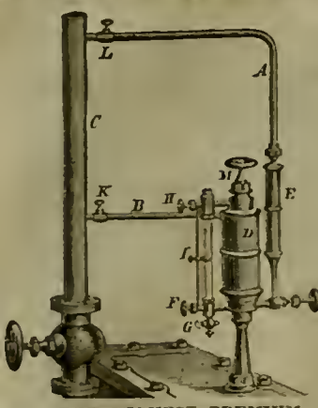
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
10v27tf J. HENDY, No. 32 Fremont Street.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe H into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted t give satisfaction. Patented February 14, 1871. Man factured by California Brass Works, 125 First street, S F. 24v23tf

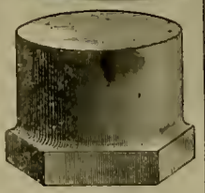
6v29-4m

Improved Cast and Forged STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]



To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by abscuce of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

PLATINUM

Vessels, Apparatus, Sheet, Wire, Etc., Etc

For all Laboratory and Manufacturing Purposes
H. M RAYNOR,
25 Bond street, New York.
Platinum Scrap and Native Platinum purchased.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsratss as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphsry into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

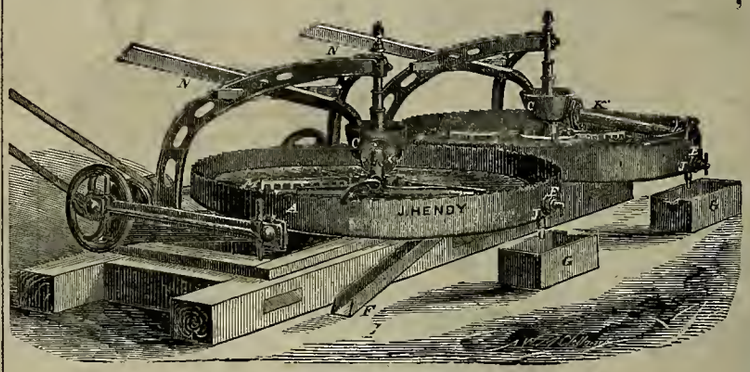
OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator,



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir*:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons.

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir*:—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use.

O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir*: Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection.

E. R. BURKE, Superintendent.

For description send for Circular.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, SEPTEMBER 19, 1874.

VOLUME XXIX Number 12.

Improved Condenser for Quicksilver Fumes.

Quicksilver mining in Oallfornia hae within the past year assumed a poeition of great importance. The scarcity and high price of quicksilver has stimulated prospectors to renewed exertions, and hundreds of new mines have been found. The great queetion with all these mines is, which are tho best of the many furnaces and condensers in the market, as eo much depends on the appliances for working the ore. Several new forms of condensers and furnaces have been brought forward hy inventors since the "quicksilver excitement" began, bnt none of these have brought about any radical change in the method of working ore. More fault is found, probably, with the condensers in nee than with the furnaces, and any improvement which will make these articles more effective in their operation, is a boon to all miners.

We illustrate thia week an improvement in this direction, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by James B. Randol, enperintendent of the New Almaden quicksilver mines, and Ferdinand Fiedler, foreman at the aame mines. Both of theae gentlemen have had extensive experience in the reduction of cinnabar ore, and have experimented in every direction, with a view to improve aa far as possible the appliances and methods employed. They have discovered that the condsneation of mercurial fumea is very much accelerated when they are brought in contact with the inside of a glass plate, when the outside of the plate is exposed to tbe outaide atmosphere. Ths glass is arranged in a wooden tank hereafter deecribed. The wooden tank will last longer than metal, as the fumes do not act npon and destroy it.

The tank or vessel for condensing the fumea can bs made in any deaired form, that ehown in the engraving being quite convenient. It is made of wood and numerous openinge are loft in its sides and ends, which are covered with windowe or panea of glaea set in a frame The openings, B, all except thoee in immediato contact with the floor of the condenaer, are coostructed as shown in Fig. 2; a frame, L, is made large enongh to receive the window aash or platea of glaes. The four outaide edgee of the frame are grooved, as at O, to receive the planka which form the aiding of the condeneer, thus atrengthening the condeneer and preventing the planks from warping.

The upper rail of thia frame haa one or more openings, i, leading from the groove to the ineide of the condenser, thus providing a roadway for the quicksilver, which condenaes on the inner side of the tank, and which will naturally follow down the wall and drop through eaid opening to the floor of the tank. The inner edges of this frame have on their upper and aide edgeaa flange, against which the window sash or pane of glasa rests, and into the upper edge of the lower eill of the frame a groove, S, is cut, in which the window eash sets. This groove has one or more openinge, i, eimilar and for the eame purpoee ae the openinge, i, above described. A cross har, T, which ie eecnred on one eidge of the frame by an open mortise, and on the opposite side by a similar mortise, with the eide of tho frame haveled to make said bar slide easily, faatena the wiudow sash in its place; or any other snitable fasteniug can be ueed.

The framea which rest on the floor of the condenser are construoted in the eame manner as those already described, with the exception that the lower rail or sill of the frame is leit out and the wiudow sash reets directly on the floor of the condenser. The lower edge of the saeh is perforated with two or more openings through which the quicksilver condeneed in the tank makes ita exit into a euitable gutter, which conducts it to the receiving tank.

The floor of the tank is built on an incline, having its apex in the center of the same, and aloping to hoth sidee on an inclination which ahould not be less than two inchee to the foot. The tank is provided with interior wooden partitions, which are eo arranged ae to provide alternate openings or passagea above and below, in the ordinary manner of arranging the partitions of a condenser. The outside edges of the partitions and end sidings of the tank are fitted into upright grooved timbers; and if tongued and grooved hoards are used for forming the partitions and ends of the tank, the nails which fasten them together are driven into the tongne of each plank and covered hy the groove of the next plank.

The sides of the condensing tank are fastened to the onter edge of the grooved timbere, and the whole is hound together by strong scantlinge, W, placed vertically against the different divisions or partitions outside of the tank, and eecnred hy metallic rods or holts, e, and nnts, f. The holte or rods pase transversly acroes the tank from side to eide throngh each partition, and are protected from the action of the fumes hy a grooved timber through which they pass, and which is covered again hy the plank of the partition. The rods which secure the corner timbera pass along the outeide ends of the tank. The fumes enter the tank at the rear end and pass ont through the opening, G, to anothor tank, or to other condeneing apparatns.

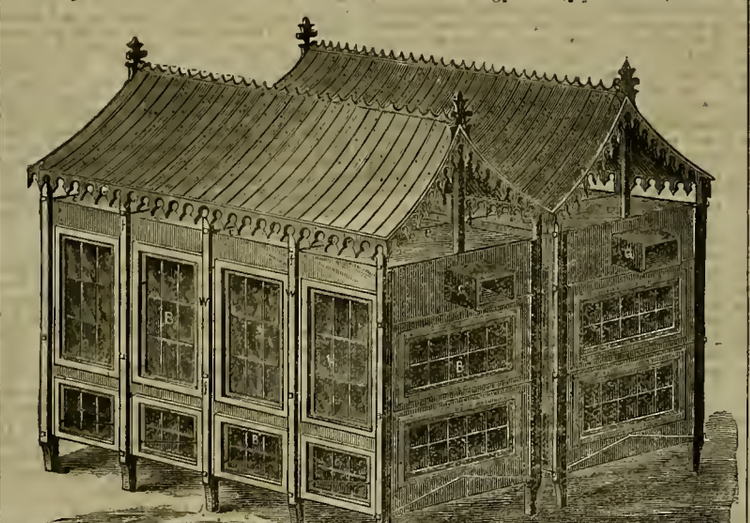

FIG. 1. RANDOL & FIEDLER'S QUICKSILVER CONDENSER.

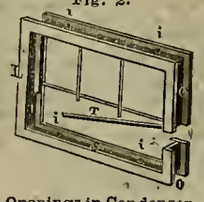
A wooden tank of this character will last longer than a metal tank, aa the fumes do not act npon or deetroy it. Theee condenaere can he made at very emall coat when compared with the metallic tanks now in uee; and condensation ie very thoroughly accomplished in in it without the necessity of any water ae a hath or cooling agent.

Fig. 2.



Openings in Condenser.

Aa to the well proved value of wooden coudensers we extract the followiog from "Notes of a Metallurgical Journey in Europe," by J. A. Church, M. E. Writing of the condensation chambers at Valalto, Italy, he says: "Theee chambers, which are placed beyond the tnbes, are lined with wood. The wood not only forme a perfectly tight lining, hut it afforda cleaner mercury, and also more of it during the campaign, from the fact that less metal and soot cling to the emooth wooden snrface than to a cemented wa'l. After many experiments with oements, bricke, etc., thia material hae been found the best."

Of the tubea leading from the chambers he says: "The tnhee are of wood. Iron tnbes were formerly used, but they made a great deal of trouble, being rapidly eaten hy the enlphnrons acid vapore. They had to be turned every 12 or 18 months, and entirely renewed in 2 or 3 years Though the wood tubes are kept constantly wet, their durability is much greater than that of iron, and I believe they have been renewed only once in twelve yeare. A main fault of the iron tnbes is that the soot obtained from them is contaminated with iron dnst and iron oxides, which makes the eeparation of the mercury from the soot more difficnlt, and aleo introduces a certain amount of iron into the feet of condeneing epace, and 4,784 square fect of condensing surface, all erected at a cost of only $1,500 for materiala and constrnctiou.

At New Almadan the condeneers of wood and glass, snch as we have described, require no water for cooling, as the glass performs that service in a more satiefactory manner. For some time they have had in nee the patented coudeneers of Messrs. Fiedler and Randol, and find them to he enperior to all others in the efficiency of their working and the leseened cost of construction. Four condensers lately erected there have each a condeneing space of 2,640 cubic feet, and 1,196 square feet of ontside coudensing surface, a total of 10,560 cubic feet of condeneing epace, and 4,784 square fect of condensing surface, all erected at a cost of only $1,500 for materiala and constrnctiou.

HERMANN SCHUSSLER, chief engineer of the Spring Valley Water Works Co., accompanied by his wife and family, started for the East and Europe by the overland traiu one day this week. During his trip Mr. Schuesler will visit all the chief Easteru cities and thoso of England, Ireland, Scotland, Germany, France, Italy, Austria, Turkey and Egypt, for the purpoee of inspecting all the great engineering achievements in those countries. Particular attention will be paid to the departments of hydraulics and drainage. The tour will extend over a period of six months. Mr. Schuesler is well known in the mining districte from bis connection with several ditch enterprises. He waa engineer of the Virginia and Gold Hill Water Worke, an engineeriug enterprise of great difficulty.

A MEETING of the Nevada Pioneers was held Tuesday evening at National Guard hall, Virginia city. A constitution and by laws were adopted, and the following permanent officere were elected: President, Jacob Young, Jr.; Vice Presidents, Thomas Careon, G. L. Hawkee and John Dohle, of Virginia City; J. A. Winterhaner and C. Cook, of Gold Hill; Secretary, E. W. Kuster; Treasurer, Geo. Mann; Marshal, Thos. Kelly; Board of Directors, C. J. Fogg, William McQuirok, A. J. Smith and Wm Coryell.

CINNABAR diacoveriee continne to be made in Sonoma county with encouraging frequency. A company is prospecting on Malone'a ranch, Sonoma mountain, about ten miles from Petaluma. There are good indicatione.

THE Liberty mine at Eureka, Nevada county, is about to be sold to San Francisco partiea. New hoisting works are soon to be erected so that the mine may he thoroughly opened.

Work at the Foundries.

For the past three yeare the husiness depreesion generally has been severely felt at the foundries and machine shops in this city, and business has been comparatively dull. Of course they have all been running, hut have seldom been crowded with work. Of late, however, they have hed their hands full, and are as husy as possible. This summer hae been an exceptional one among them, and the nnivereal answer about work is, "very huey."

There has been a large increase of late in substantial huildinge, which require iron in their construction, and thie item alone furniehes conaiderahle work. Mining machinery, which forms the bulk of the orders at our large foundries, ie heing made in greater quantities then ever hefore. Hoisting worke and mills are of a much heavier character than heretofore, and this has caused a marked increase in the amonnt of fonndry work. A few yeare ago a 20-stamp mill was considered a large one, while now they receive orders for complete milla of from 40 to 60 and even 80 stamps, with pans, eettlers, etc. Tho hoisting and pumping works are of a more substantial character, consequent npon the increased depth to which mines are worked, and miniug machinery of all sorts is of a much more expensive kind than nsed to he ordered.

While more extended mining operations are the cause of hoavier orders, there are other circumstancea which lend their aid to this increase of husineee. More factoriee of different kinds are being established throughout the coast from year to year, most of which require machinery of different kinds. Marine work, also, has increaeed of late and is becoming quite an important hranch of the foundry husineas. The many eteamships and eteamers at this port require continual overhauling and repaire, while new tugs and coasters are heiug built every year.

Few of the fonndries among ne are restricted to any special clase of work, unlees it is the small one, which lack the neceseary facilitiee for all kinds of work; this heing the case work ie pretty generally distributed among the larger iron worke, which are all nenally husy at tho same time.

It is a matter to be noted by thoee who are always crying out ahont the asseasments levied hy the mining companies of the coaat, that this money ia distributed in just the channele where it is needed. Theee asseasmonte draw money from the pocket of the capitalist who invests in suoh securities as mining stocks, and is pnt within the reach of the minere who work the mince and the mechanics who make the machinery. If these croakere would take the trouble to call at aome of the foundries and see from 100 to 300 men at work in each on mining machinery, they might be made to nnderetand that the trnsteee do not steal *all* the money received from aseesemeuts, hut that it is spent in such a manner that hard working men are benefitted,

We are glad to note this renewed activity among our foundrymen, and hope that it will continue next year, as it promises to do.

SENATOR Stewart and John P. Jonea heve made contracts in San Bernardino to tranaport freight, lumber and machinery from Spadra, the railroad terminns of the Southern Pacific Railroad, to Snrprise Valley and Panamint, and for return freights of ore, and a pony express is to be etarted at once hy the freight contractore. Jones has also contracted for 100 mulea with equipmente, to pack ore, etc., through the canons of Panamint.

THE directors of the Nevada State Agricultural, Mining and Mechanical Society have determined to hold a State fair this fall at Reno, on October 20 h, 21st and 22d. The Central Pacific railroad company have agreed to tranaport free of charge over their road all articles and animals exhibited hy exhihitore in Nevada.

COAL, it is eaid, haa heen found in Santa Oruz county, notwithetanding the report to the contrary of a San Francisco coal sharp.

A BLAST of seven hundred kegs of powder was set off at the American diggings, at Sebastopol, Nevada county, a few daye ago.

CORRESPONDENCE.

Cloud Bursts.

EDITORS PRESS:—The recent disastrous local floods that have partially destroyed the towns of Enreka and Austin, Nevada, and have done a vast amount of damage to property in other portions of tha State, have probably directed public attention to the somewhat singular natural phenomens popularly known as clond bursts, water spouts, etc. The idea seems to be generally prevalent that the phenomena are nothing more than very violent thunder showers, and such indeed they truly are. But the causes that precipitate such immense falls of water over extremely limited areas are very olosely allied to those which form water sponts on the ocean, or other extended bodies of water, i. e., air thoroughly eaturated with moisture, meeting with cooler counter curreuts, and moving in circles of small radius. Water spots are caused by currents of air moving in opposite directions, meeting and sucking up or raising the water in the vortex. They usually form a double cone; the upper one, with spex downward, consists of a very deusa clond. The lower one, with its apex turned npward, consists of a columu of water sometimes several hnndred feet in hight. They occur moet frequently in regione subject to alternate atorms and calms, and owa their origin to miniature circular storms or whirlwinds.

But to return to our Nevada watar sponts, for such they really are, or would be, did a body of water exist for tha formation of the inferior cones. We find in tha Nevada basin all the conditions most favorable for their formation. Dnring ths summer and autnmn months, miniatnre sand spouts cau be seen almost any day on any of the eand or alkeli plains so common in tha interior basin. Sometimes several of them will be in sight at the same tima, all moviug in different directions, sometimes in right lines, more frequently in circles. The same canses operating in the upper curreuts of air form the so-called cloud bursts or water spouts.

About the middla of July, or perhaps in some seasous as late as tha first of Augnst, the raiuy aeaeon sets in iu Arizona aud Northern Mexico, aud the warm southern current of air, only partially deprived of its vapor, followiug the course of the valleys, is carried to the uorth far into the "Great Besin." In its whole coursa it passes almost altogetber over bare alkali plaina aud valleys destitute of verdure and intensely heated; consequently, its temperature is constantly iucreased, and its capacity for moisture in a corresponding degree, until it becomes thoroughly satnrated, when, meating with the cooler currents from the north, it is suddenly condeused and precipitated in violent showers of rain and hail, often accompanied by wonderful electrical dieplays. Such storms are of almost daily occurrence during July and August. In early morning the sky is very clear—not a cloud from zeuith to horizon; about 10 o'clock light, fleecy clonda begin to gather over tha mountain ranges, and ao qnick ia the coudensation of vapor, that in lesa than 30 minutes the whole heavans will be covered with dark masses of thunder clouds (cumuli).

Most of these atorms, however, pasa off without doing any damage, hnt occaeionally the conditions are favorable for the formation of cloud-bnrsts or water-spouts. The southern currents of moiature-laden air meet with cooler counter currents and the atorm, inatead of passing qnietly on ita couree, ia deflected into a circle sometimea less than a mile in diameter, where it appears to remain etationary, sometimea for houre, apparently colleoting and condeusing all the vapor iu the air for milea around, and iu some cases actually pouring it through the vortex of the aerial maelstrom in a solid column to the earth below. Most usually, however, the discharge takes place in the form of hail atonee, or rather lumpa of ice sometimes more than au inch in diameter, intermingled with raiu drops of woudarful eize.

The sudden coudenaation of such immense qnantities of vapor develops an unnaual amount of electricity, aud as a oonsequence all suoh storms are accompanied with violent electrical dieturbances; vivid flaehes of lightuing quickly followed by loud peals of thunder aucceed each other with great rapidity; at the eame time innumerable eleotrical sparks shoot frnm cloud to cloud iu quick aucceesion, attended with a sharp orackling noise, plainly audible to a close observer. The rapidity of the fall of water is somethiug remarkable; even tha alopes of eteep mountains appear covered with a aheet of moving water, aometimes more than an inch in depth, which, gathering in the bottom of aome narrow cañon, movea forward with irreaistible force, presentiug a solid front 5, 10 or even 15 feet iu hight, tearing np and sweeping befora it giaut trees, maasive boulders, in fact, auything and everything that happens to he in ita course. Bnt auch atorms are not confined to the mountaina alone; they occur quite aa frequently in the vallaye, but the conditions of lavel land protect property from the diaastrous effaots of a moving flood.

The writer waa an aye-witnaas to a atorm of the kind which took plaoe on tha 4th of August, 1873, in the valley near the south end nf Pancake mountain. For at least four honrs the storm soemed to center around ona spot, from all poiute of the oompass. The principal fall of water, or rather ice, covered a circular area not more than a mile in dismeter, and must have been extraordinary, as the ground remained as white as in mid-wiuter for at leset sixty hours, under a burning August sun. During the past summer one of theee storms took place in the vicinity of Currant creek, where, from the testimony of relisble eye-witnesses, the fall of water must have approximated one-half inch per minnte. Indeed, so great was it that the grond, a gentle declivity, wss covered to a depth of 10 inches in less than thirty miuutes. Another most prolific cause of these storms is a lack of verdure in the valleys, aud of forests on the mountains. A. J. B.

Hamilton, Nevada, Sept. 10th.

Manufacturing Machinery at the Mechanics' Fair.

Wood Working.

In coutinuing our review of manufacturing machinery, at tha Mechanics' Instituta Exhibition, we come now to that deeiguated wood-working. Prnminent among the industries ou this coast is the lumber interest. We have not the statistics at hand to give its value; but it is immeuse, and givee employment to thousands of people and many millions of capital. For this reason it might reasonably be expected that the clasa of machinery employed in that husiuess would occupy a large apace in a geueral exhibitiou of the producing and manufactnring interests of California. The exhibits iu this line consist of two shingle machines, a portable saw mill, a patent self-feeding gang edger and lath mill, gang bolter, a scroll saw machine, a hand saw machine and a turning-lathe. These, at least, are all that wa have noticed up to this presant time of writing.

The shingle machines appear to attract muoh attention, even from the ladies, who ara not generally supposed to take much interest in such matters. Perhaps to add to the interest from this sonrce, or possibly because the aupply from the gallery has run ont, we notice that the gentleman in charge of the scroll sawing machine often busies himself and amnses the crowd by sawing shingles up into the form of fans, much after the form of those supplied for a while in one of the galleries. Huntiugtou's shiugle machine, shown in operation, is a California invention. invented by Mr. H. himself, and for aimplicity, durability and precision of action it probably has no euperior. It is conetructed with a siugle, upright carriage, and is so devised as to hold the block eecurely to its work, thus securing a perfectly formed shingle. It delivers its work so that the operator can pick up the ahiugles as fest as they come from the machine and pass them directly to the edger, betweeu which and tha machine he stands. This arrangement is of great convenience, and adds largely to the speed with which work can be turned off and finished. Some fifty or sixty of these machines are now in use on the Pacific coast, giving the most perfect satisfaction wherever they have been employed. This machine has lately been introduced into the Eastern States.

Mr. Huntington also exhibits a portable saw mill. These milla, as well as his ahingle machines, are built in the atrongest and most durable manner. The saw mills are capable of driving sawa up to 64 inches in diameter. They are furniahed with improved head-blocks aud feed works, of Mr. Huntington's own iuvention. Oue of the head-blocks is placed on exhibition near the mill.

Valentine'a double-carriage shingle mill is also shown iu operation. It is quite a uovelty in its way, and attracts much observation by its singularity of motion. As its name implies, it ia constructed with a double carriage, and fed at both ends, by which the saw is made to cut on both sides, thus utilizing both time and apace. It delivere its work at each end, aud appears to do good work. Thia machine is largely used in the northwestern States, where it was iuveuted and firet placed in operation. The machine on exhibitiou was constructed in this city, with a view of iutroducing it upon the Pacific coast.

Mr. A. Potter exhibita a Mackey, Walter & Co.'a patent eelf-feeding gang edger and lath mill. Thia edger will take lumber from 3 to 36 inches in width, with a thioknese of from one-half to six inches. It has four saws—the two center oues of which ara readily adjuatable while in motion by a orank at the frout of the machine, where a lever ia also fixed to adjust the feedere to the varying thicknesses of the lumber which is being dreesed. The operator haa uo occasion to leave his position to adjnat either of the saws or tbe feeders. The lath mill ia aupplied with au attachmeut, by the nse of which only that portion of the bolt to be converted iuto laths is cut which will admit of being worked up iuto perfect atrips. The balanoe of the bolt is rejected in a aingle piece, thus aaving a uaeless expenditure of power and waate of material.

Mr. Potter aleo exhibits a gang holter, running from eight to twelve sawa, and which can work anything from four feet to any desired langth. Thia machine has heeu placed in tha Pavilion to-day. All this machinary is in motion, so that tha principles of working oan ha folly shown; but, for manifeat reaaons, but little work can ba doue in the Pavllion.

Hansen's improved scroll saw machine attracts much attention from the skill with which it is manipulated, and from the intricate and beautiful work which it is capable of doing. In this machine the old-fashioued sash arrangement, which was considered indispeusable for keeping up equal tensiou, is here dispensed with, and by a peculiar combination a spring saw is made to work, with perfectly equal teneion, either up or down. The finest kind of eaws can be used, thereby doing the finest kind of work. It can also be run at a much higher rate of speed than can be applied to the sash or ordinary apring saws. It has an adjustable table, the only one that csn be tipped either side-ways or end-ways; hence it is peculiarly adapted for pattern work. The same is manufactured in this city.

O. Bonney axhibits a patent adjustable band sawing machine, which, however, we hava not seen at work. Theee saws, we learn from a circular attached, are made in this city, in three different styles—large size for mill work; bracket or medium size, with stationary top, or with a tipping top, like the one on exhibition. The introduction of band saws, and especially thosa of large dimensions, is a very important mechanical improvement in the ecouomy of mannfacturing and working lumber, to which wa propose to refer in a future issue.

The only other wood-working machine in the Pavilion, so far as we have observed, is the smell turning-lathe, employed by Mr. Brehm in the production of fsucy articles from California woods. This lathe ia au elegant and most perfect piece of workmanship, as is sufficiently shown by the character of the work which it turns out.

Minerals in Monterey.

The mineral resources of Monterey county, which have so long lain dormant, are now attracting considerable attention, and mining bids fair to become one of the leading industries of our people. With the legends that have been handed down from the lest oentnry, which mysteriously meution the working of fabulously rich silver mines, we will not deal in this article; hut from the remoteet period within the memory of the oldest inhabitant, these legends have been rapeated, and numerous have been the exploring expeditions fitted out for these hidden or lost minas, but they have as yet met with uo success. But while some have sought for lost mines, others have found

New Mines,

Many of which are proving to he of great promise. The recent discoveries go to show that our couuty is rich iu valuable minerals and plumbago; cinnabar, coal, silver and gold are proved to exist in several sections of the country, and the

Sand and Gravel

Deposits of Monterey are noted the State over, for their superiority to any fouud elsewhere on the coast. The existence of thie sand will yet lead to the establishment here of large glaes works; and the granite quarries of Monterey and Carmel will in time give employment to several hnndred workmen. The

Crystal Lime Quarry,

Near Natividad, is probably the best paying mine in the couuty, (except the Sand-bank, if it ia proper to call it a mine). This mine is worked by Messrs. Barbour & Brand, under laase from the owners, and ie producing the fineat quality of lime.

Cinnabar Leads

Have heeu discovered in abont twenty differeut places in tha county recently, and experienced miners have had uo hesitancy about taking hold and opening them for interesta in the mines, a thing they would not do if they didn't show croppinga of undisputed richuess.

Silver.

We were shown apecimeus of silver ore from the Robert Emmet mine, situated in the southern portion of the county, a day or two since, which is said to have assayed $400 to the tou. Thie mina waa originally taken up for quicksilver, but the ledga has chauged to silver. Several others that were taken up for quicksilver give evidence of tha exiatence of silver.

Gold and Coal

Are also known to exiat in thia county. The former is found near San Antonio Missiou, where placer diggings have been known to exiat since before the diacovery of gold up uorth. And the latter is represented by Carmel, where vigorous meaaurea are be taken to develop several very promising mines.

Plumbago and Marble.

Recent discoveries have added these two valuable articlee to the mineral wealth of the county. A oompauy was formed this week to work a quarry of the latter, and samplee of the former have been sent to San Francisco for aaeay, and probably the company will be formed thia week.

The Prospecting

That is now going on, both by our citizens and miners from other aections, will eventually, we believe, prove thia oonnty to be one of the richeat mineral districts in the State.

TEMPIUTE OAE.—Thirty-five hundred pounds of ora from tha Inca mine, Tampiuta Diatriot, waa worked at the Floral mill and produced $616. Tha averaga aaaay waa $408. The bullion was quita fine, viz.: 930. Mr. McMaatera ocntinuaa to euperintend thia mill and is securing very good reaulte.—*Pioche Record.*

Mining near Placerville.

A correspondent of the *Bulletin*, writing from Plscerville, says: The halcyon days of placer digging are gone forever, hut "the honest miner" still lives and flourishes about Piscerville. At least 20 drifting-claims are being worked. In some the gold is extracted by simply washing in an ordinary sluice box; in others, whera the gravel is more cemented, it requires crushing hy stamps before the process hy washing is commenced. The auriferous gravel belt, lying about Plecerville, covers au area of 12 milss in length with two in width. The depth of the gravel lying npon tha ancient river bed ia abont 150 feet. Tha great bnlk of this is lava-capped, varying from a few feet to several hundred feet in depth. This requires to he worked by the hydranlic system—the precipitation of the vast oolumns of water from a high elevation upon the gravel bed. I saw one of these monsters in operation at the Excelsior mine. The water, ejected through a 6-inch nozzle, rushed in a mighty torrent against the hard, gravelly hillside, plowing huga furrows through it, sending a shower of stones whizzing through tha air, detaching large boulders, and eating ita way like a hungry cormorant into the very vitals nf the mountain.

The compeuies working iu this viciuity are "close corporations." They manage their owu affairs and keep their own counsels. They do not appear ou California street. They do not ask the geueral public to share their profits or help them pay the r assessmeuts. They are close-mouthed men, bnt hy dint of considerable pumping I gained some scraps of knowledge. I learned, among other thinge, that a single company—the El Dorado Water and Deep Gravel mining company—au association of Sau Francisco capitalists—employ at least oue thousand men in hydranlic mining, the construction of flumes and ditches, and the building of reservoirs. The main ditch, commencing at Sportsman's Hall and ending at the confluenca of Alpine creek with the south fork of the Amarican river, will he 26 milee in length. It will be about five ft. wide at the bottom, thirteen ft. wide at the top, and six ft. deep. It rnns through a dense forest of pines nearly all the way, ovar a terrible rough conntry, across deep cañoua, over precipitous bluffs, along the sides of almost bottomleea ravines. There are tnnnels to out, and chasms to bridge and wild gorges to carry flnmes across, and a thoueand nbetacles of natnre to overcome. Bnt with the best engineering talent and plenty of money the work is pnshed vigorously forward and will be ou toward its completion before the winter snows set in. When this is done the company will be in a position to commeud the enormous volume of at least 2,000 inches of water for the washing of the auriferous beds. Aud this water will then be available for the irrigation of a large section of conntry now consumed hy the long summer droughts.

Hydraulicing at La Porte.

On Wednesday of lest week, says the Plumas *National*, in company with Mr. O. Gowell, of the firm of Conley & Gowell, we paid a visit to their celebrated hydraulic claim near La Porte. The water seaeon is now over and the company have about finsihed cleaning up for the year, one gaug of men being still at work in the lower cnta. Mr. Gowell uses two monitors, running through each pipe seven hundred inchea of water; and during the flueh part of water seaaon a very larga stream is turned in to carry off the tailings. The bank is from 50 to 80 feet deep—all qnartz graval—aud proapects "from tha top down," and with surprising regularity, too, for Mr. Gowell informed us that he could meaaure the grouud, and calculate cloaely the amount of gold which he would clean up. Ahout aix acres have been atripped this year, but only half of the bed-rock wae cleaned, as tha water gave out two or three weeka sooner than was expected. Their large flume is 6,000 feet in leugth and part of that diatance has a grade of only four inches to 16 feet. The preseut year's work has uncovered a large baaiu that haa proved to be a very rich portiou of the claim. The sum cleaued up is never made puhlio by the company, but it certainly haa been large, and we imagine that $100,000 would not be much above the figures. One of the peculiar features of the claim is the heavy deposit of black sand. It is saved "by the ton," and after heing worked over until all tha gold ia saved, that can be extraoted hy ordinary means, it is shipped to the Bay, and sold at $560 per tou, and from there sent to Swansea, Walea. The claim has been worked for the paat twenty years, aud always with good results. Mr. Gowell saya that after next year they will commeuce at the foot again, and come up with the strip, taking all that is left of the channel ou tha side next to town. It will take fifteen yeara—averaga water seasons—to work out the claim; and aa the owners oan oonnt on big pay all the tima, it is certainly valnahle property.

MILL FOR JEFFERSON CANON.—F. H. Smith ahipped, this waek, for the Jefferson mine, in Nya oonnty, the machinery for a 10-etamp mill. The castings are heavy, and oomprise the iron work of a 10-stamp battery, with four pana, three aettlera and a roasting furnsce; and the outfit mada a load for nina larga teame. Tha Jefferaon, ona of the most promising mines in Nya county, is owned by Lew. Hanohett and A. H. Rutherford. Both hard working, up-and-down good fallows, deserving of this success.—*Measure for Measure.*

MECHANICAL PROGRESS.

PAPER BAGS.—Not many years ago these articles, so necessary in every description of retail business, were generally made by the consumer, and were but rarely purchased. Now the reverse is the case. They are but seldom made by the person using them; and, in consequence, a great trade is done in them, many persons being wholly employed in the business. Many patents have been taken out to produce them by machinery. They are thus made not only of the ordinary old-fashioned shape, but also with square bottoms, with rounded bottoms, with gusset sides. They are also made in endless tubes, and cut off in lengths. Perhaps the latest invention is a mechanical device for making paper bags in one piece from a roll of paper. The paper is folded in the direction of its length from the two sides, so that the edges overlap each other about an inch in the center, the edges being pasted together. The paper is drawn through a folding-machine, with the seam on the upper side, centrally, by a pair of rollers, which feed it along to the devices for forming the bottom of the bag. The feed-rollers then stop until the bottom is formed and the bag cut off the required length, when they again feed it forward, pushing out of the machine the bag already formed; and so on, making a bag at every revolution of the machine.—*Technologist.*

RAIN GAUGE.—The success of Professor G. W. Hough, of the Dudley Observatory, in constructing self-recording barometers and thermometers, lends additional interest to his announcement of the successful construction of an automatic evaporometer and rain-gauge. The apparatus consists of a vessel two feet square and one foot deep, suspended on levers, and held in equilibrium by a small spring, the amount of change in the weight of the mass either from rainfall or evaporation being indicated on the scales of a delicate balance. In order to secure the mechanical record of the hourly variations in the weight of the vessels and of its contents, the professor causes the lever to vibrate between two platinum points, so placed that whenever a change in the weight of the vessel by a given amount (say ten grains) takes place, a magnetic circuit will be established, passing through an electro magnet. A micrometer screw will then be operated by means of clockwork, thereby tracing a curve on a revolving drum, precisely as in the case of the self-recording barometer and thermometer. —*College Courant.*

WOODEN PNEUMATIC DISPATCH TUBE.—The former dispatch tube which was laid between the Capitol and the government printing office, in Washington, proved a failure. It was a cylinder of wood, bound together by iron bands, and covered with tar. It was placed so deep that the superincumbent earth crushed the tube. A new tube is now being laid which, on the outside, is a rectangle twenty inches wide and twenty-three inches high. On the inside, the corners being cut off, the cross section is octagonal. The inside hight is nineteen inches. To make this tube air-tight, it is first covered with tar. The carrier, which is to move through the tube, is made of zones of wood riveted together. There is an exhaust engine at one end of the tube. The carrier has traveled one thousand feet in one and a-half minutes. The average grade as far as the construction has proceeded is about six feet in one hundred.

RUBBER HORSE SHOES.—The invention of a rubber shoe for horses promises much. The new form of shoe is designed as a substitute for the iron shoe, and as a means of preventing the many maladies to which horses' feet are subject. The inventor claims that horses suffering with cracked or contracted hoof, and similar painful hurts, are quickly cured by the substitution of the rubber covering for the unyielding metal shoe. The elasticity of the former allows the hoof to remain in its natural shape while protected from abrasion against pavements by the heavy rubber sole beneath. As compared with iron shoes, the cost of the rubber ones is about one-third more, and their weight is some 40 per cent. less. Sixteen sizes are manufactured, so that accurate fits may be obtained. With reference to wear the durability, owing to the fine quality of rubber used, is very great.

SHEET METAL BOXES.—The features of novelty of a recent invention consist in making certain parts of thin sheet metal boxes, namely the hinge and the spring catch: First, by bending the edge of the back of the box and cover over a piece of wire so as to form a hinge, and, secondly, in bending over the front edge of the lid or cover and also bending the top edge of the front part of the box, so that when the lid is forced down it forms a secure spring fastening.

A DISCOVERY of interest to wood engravers is the fact that plates of polished slate may be used as substitutes for box wood for engraving. These plates will furnish over 100,000 impressions without loss of detail, do not warp, and are not effected by oil or water.

A NEW FABRIC.—Cotton and wool are first carded separately on separate carding engines, and then mixed by passing them together through a third carding engine, and the sliver obtained is subsequently formed into yarn.

Consuming Smoke.

Seven or eight of the glass factories in this city have an apparatus, the invention of a Bostonian, for feeding coal to the furnace that is a great improvement in this respect on the usual method of throwing the coal on top of the fire. This machine is situated underneath the furnace, and its principal feature is the bucket for conveying the coal to the fire, the other parts simply serving to manipulate it. This bucket, which is cast iron and has a movable bottom, is about the size and shape of a half-bushel measure and has a fan attached to one side of the brim that projects about 20 inches. The bucket and hat somewhat resemble a hat of the fashion formerly worn by firemen, provided the hat be inverted and the visor the rear bent at a contrary angle. When the bucket is in position with the fireman to shovel coal into it, its fan fits into a circular opening in the furnace grate; when the bucket is filled it moves upward and forward, the fan receding as the bucket advances, until the latter rests equally under and against the opening in the grate; the bottom then rises and discharges the contents into the hot bed of coals resting on the grate bars; when the bucket recedes to its old position, ready to be filled again. The machine is operated by the fireman, by simply turning a wheel that closely resembles the pilot wheels on our river steamers. The coal being thus discharged under the hot coals instead of thrown on top of them, the smoke is almost entirely consumed, and what little escapes is of a light color and does not appear to carry any soot with it. If all our manufacturing establishments and dwellings were provided with fire-places and furnaces that would come even as near to consuming their own smoke as the apparatus we have described, there would be a vast improvement in our atmosphere.—*American Manufacturer.*

THE INVENTOR OF STEREOTYPING.—William Ged, the inventor of stereotyping, was a Scotchman. He was a jeweler in Edinburg. So long as he adheered to his original vocation he was permitted to prosper. When he ventured to exercise his ingenuity by facilitating the printer's art, he was doomed. On his making known his discovery of block printing, the trade deemed their craft in danger, and formed a combination for his destruction. Master printers, journeymen and apprentices united against him as a common enemy; they loaded him with invectives; they reproached him with ignorance and assumption. The arrows of calumny hit him on all sides. Who could long stand such an array of hostilities? Poor Ged, who ought to have made a fortune by his discovery, sunk under the load of persecution, and died of a broken heart.—*Newspaper Reporter.*

MACHINE WANTED.—A correspondent of the N. Y. *Tribune* says: Farmers generally require a machine, I think, such as I have never seen or heard of, but of which I have especially felt the need, as it will save labor and utilize forage. It is this: Say a machine that will pulverize, or crush, or grind, with once handling, our corn crop, that will reduce the entire growth, cob, shuck and stalk, as fine as ordinary meal. After the corn is cut and put in stooks (twelve hills square is the habit generally prevailing in the West); then as soon as the stooks are dry enough feed them entire into the machine, which might be similar to a grain thresher, and propelled by steam or horse-power. My object is to place the corn-stalks as well as the corn in condition for the cattle to properly masticate, digest and assimilate.

STREET WATERING.—An estimate founded on private inquiry, tells us that the cost for labor in watering the streets of London averages about £135,000 per annum, the cost of water being additional. It is contended that the whole of this watering can be accomplished in a far more effectual and advantageous manner, by a system of permanently laid pipes, for an expenditure of less than £3,000 per annum in labor; while the interest upon the plans necessary for the purpose would not exceed £20,000, making the total yearly cost of watering (exclusive of the water itself) only £23,000, instead of £135,000.—*Builder.*

STOPPING RUNAWAY HORSES.—A novel apparatus for this purpose is arranged by attaching to the cross strap of the bridle of a carriage or saddle horse a light tube, inside of which is a small roller; attached to this roller is a curtain of macintosh or other light and flexible material wide enough to reach across the animal's eyes, and long enough to cover the nostrils. This curtain is held in its place by springs, and is lowered when released from springs by a counterpoise or cord. It is returned to its place by another spring attached to the roller.

CLEANING GRAIN.—English exchanges describe a machine which has for its object the cleaning of wheat and other grain, by passing it between two discs, one rotary the other stationary, on the adjacent sides of which are set wedged-shaped projections on knives having roughened sides; when the disc is made to rotate the wheat grain is agitated and cleaned by contact with the roughened sides of the wedge-sheped projections.

PROPOSED FOG-SIGNALING APPARATUS.—This consists of a whistle actuated by air compressed into a reservoir by a hand pump. The signals are given either by a cock opened and closed by hand or by a cam operated from the hand lever or crank shaft and fly-wheel used to operate the pumps.

SCIENTIFIC PROGRESS.

The Microscope as a Criminal Detective.

The annals of criminal jurisprudence furnish an abundance of cases in which the microscope, in the hands of an expert, has been the means of eliciting missing links in the circumstantial evidence pointing to the guilt of the accused. Instances are cited where the instrument has shown hairs, clinging to the edge of an ax, to be those of a human being, in direct contradiction of the statement of the prisoner, ascribing them to some animal; and similar scrutiny of fresh blood upon clothing has proved the origin of the stain beyond a reasonable doubt.

When blood, however, has once become dry, several authorities assert that it is impossible to distinguish it from that of the ox, pig, sheep, horse or goat. It is urged that the differences between the average sizes of their corpuscles are too irregular to measure accurately, and that a man's life should not be put in question on the uncertain calculation of a blood corpuscle's ratio of contraction in drying. In opposition to these views are some recent experiments, made by Dr. Joseph G. Richardson, of Philadelphia. This investigation disposes of the first objection above mentioned by pointing out that, while it may be valid as regards feebly magnified blood disks, it becomes void when these bodies are amplified 3,700 times. Regarding the second, he stamps it as incorrect, and cites a case in which seven human blood disks, whose mean diameter had been accurately determined at 1-3236 of an inch, were subsequently computed to average 1-3266, or only 1-352292 of an inch less than their magnitude. Dr. Richardson also points out, with reference to the last objection, that all the blood disks likely to be mistaken for those of man being normally smaller, instead of contracting they would have to expand to become conformed to those of human blood. This expansion does not occur, so that the only possible mistake in diagnosis would be to suppose that ox blood were present when man's blood had actually been shed; so that at the worst we might contribute to a criminal's escape, but never to the punishment of an innocent person.

In order to afford a positive demonstration of the facts, Dr. Richardson obtained, from each of two friends, three specimens of blood clots, from the veins of a man, an ox, and a sheep, respectively, selected without his knowledge. By microscopical examination alone, he was able to determine, with perfect accuracy, the origin of each sample. The corpuscles of human blood averaged 1-3430, with a maximum of 1-3174 and a minimum of 1-3636 of an inch; those of the ox blood gave a mean measurement of 1-4662, with a maximum of 1-4347 and a minimum of 1-4874; while those of the sheep's blood afforded a mean of 1-5952, with a maximum of 1-5405 and a minimum of 1-6451 of an inch.

From these and other experiments, Dr. Richardson concludes that, since the red blood globules of the pig, ox, red deer, cat, horse, sheep and goat "are all so much smaller than even the ordinery minimum size of the human red disk, as computed in my investigations, we are now able, by aid of high powers of the microscope and under favorable circumstances, positively to distinguish stains produced by human blood from those caused by the blood of any one of the animals just enumerated; and this even after a lapse of five years (at least) from the date of their primary production."—*Scientific American.*

TAR FOR FUEL.—Messrs. Hay & Sugden, of England, have patented means or apparatus for treating and utilising gas tar for heating purposes. The tar is deposited in a still, to which they apply a steam pipe; the heat of the steam renders the tar so sufficiently limpid that it flows readily from the still into a pipe to which a second pipe supplied with steam is connected, the pressure of steam forcing or discharging the liquid ter in the form of a spray or gas, whereon it is fired. On the bars chalkstone is deposited for retaining heat. In some cases they add to the tar in the still common soda, lime-water and ammonia water in about the following proportions: To one ton of tar, one tenth common soda, one-tenth lime water and ammonia water.

CHANCE FOR INVENTORS.—It has been claimed that paper manufactured from wood pulp is more liable to become yellow stained under the influence of light and heat than that made from other ingredients, and that for books or other publications of an expensive nature no paper made from wood pulp should be used. It cannot be, however, that this is due to any quality of the pure fibers, which are the really valuable constituents of the paper; and the removal of the matter which causes the discoloration is a good subject for investigation.—*Industrial Month.*

A BIT OF EXPERT TESTIMONY.—When Orfila, the celebrated French chemist, was on one occasion a witness at a trial for poisoning, he was asked by the president if he could state the quantity of arsenic requisite to kill a fly. "Certainly, M. le Président," replied the expert; "but I must know beforehand the age of the fly, its sex, its temperament, its condition and habits of body, whether married or single, widow or maiden, widower or bachelor."

Ammonia Ice Machines.

It is a well-known fact that when a liquid is converted into gas it abstracts a certain amount of heat from the surrounding objects, and hence liquids which volatilize readily are said to produce a certain amount of cold. Ether, when placed on the skin, evaporates so rapidly as to produce the sensation of extreme cold. Gases, like sulphurous acid, nitrous oxide, carbonic acid, and ammonia, which may be liquified by pressure, produce very intense cold if allowed to evaporate rapidly, which is done by removing the pressure. The apparatus invented by O. F. Carre, of Paris, for freezing water by means of ammonia, consists of a generator and a receiver made of iron boiler plate, and connected by means of a strong iron tube. In the generator is placed a solution of ammonia saturated at 32 deg. Fahrenheit, which is heated by means of a suitable furnace, while the empty receiver is immersed in cold water. On heating the solution of ammonia the gas is driven off and collected in the receiver, where it is condensed to a liquid as soon as the pressure passes ten atmospheres. The receiver is constructed with a cylindrical space, into which a closely fitting vessel filled with water is now placed, and the apparatus is reversed, the generator being immersed in the water. The liquified ammonia, having the pressure removed, passes again into the gaseous state, and is re-absorbed by the water in the generator. By this means large quantities of ice are produced in tropical countries at a reasonable price. None of the gas is wasted, and the only expense is for labor, apparatus and fuel.—*Jour. of Ap. Chem.*

NEW ALLOYS.—A patent has been recently obtained in France for obtaining alloys of iron with manganese, titanium, tungsten, silicium, etc. According to the *Revue Industrielle*, scrap iron and iron turnings and filings, or iron sponge coarsely pulverized, are mixed with minerals containing the manganese, tungsten, titanium or silicium, also pulverized, in suitable proportions, and moistened uniformly and completely with an ammoniacal or an acid solution, after which the mass is compressed in molds. Great evolution of heat takes place, and in a few hours a hard, compact mass results, which is broken into fragments with a sledge. These fragments do not disaggregate at the temperature of melting iron. They are used in a peculiarly constructed high furnace, and when reduced yield excellent alloys. The ferro-manganese contains at pleasure from 20 to 75 per cent. manganese, and in the same way ferro-silicium containing 22 per cent. of silicium has been obtained. Alloys of titanium and tungsten, or of all combined, are readily procurable. The temperature required is very high.

CAOUTCHOUC SOLUTION.—It is often necessary to dissolve rubber, for the purpose of mending rubber articles, etc., and the process is thus given in an exchange: The crude gum is put in clear water and boiled an hour, then cut with wet knives, or circular saws without teeth, into thin strips, which are then passed between strong rollers, and dried in a warm room; 26 parts of gum are dissolved in 50 parts benzole and 70 parts oil of turpentine free from grease. This thick solution is not homogeneous, and must be passed between polished rollers to crush the lumps.

INCONVENIENCES result from the preservation of calomel mixed with certain substances in powder. According to M. Vulpius, corrosive sublimate will in some cases form, but not when the mixture is with white sugar, milk-sugar, magnesia, calcined or carbonated, or with sodium bicarbonate. A mixture with cane sugar and sodium bicarbonate gave rise to the formation of much corrosive sublimate in three months. The change was assisted by moisture.

ANOTHER PATENT INDICATOR.—A novel apparatus has just been patented which will, it is claimed, receive the tickets and conductors' checks of railroad passengers, indicate the destination of each traveler while he is in the car, and keep a record of all the trips made, inaccessible to any trainman, or to any one except the proper agent—presumably a representative of the general ticket agent, at the end of the trip.

CARBON PHOTOGRAPHS.—According to Marion, if a bichromate picture printed in the sun is brought in contact with a plate covered with chromatized gelatine in the dark, a similar impression will be made on the second surface, and even more than one prepared plate can thus receive an impression, provided that the original plate had been exposed long enough to the action of sunlight.

DITAINE is proposed as a new substitute for quinine. This alkaloid obtained from the bark of the "Dita" has been found to be as good as quinine, and in some cases superior. The method of abstraction is the same as that for quinine. The bark yields on an average about two per cent. of the alkaloid.

WATERTIGHT PATCHES FOR BOILERS.—They should have a lip turned all around it, so that a good quantity of cement may be introduced. The cement should be made of red and white lead and iron borings, and should be very stiff.

FINE MACHINE OIL.—To prepare an excellent machine oil, mix 60 parts of oleine with 40 of olive oil; or 50 of oleine, 40 of clear paraffine oil and 10 of olive oil.

Weekly Variations in Stocks.

(Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

Mining Stocks.

Since last Friday, on which day the lowest sales for the week were made, the general market rose rapidly and steadily up to Tuesday afternoon, when a temporary weakness was shown. On Wednesday, although the market as a whole was weaker, a marked advance took place in several of the prominent Comstocks.

Pioche, Eureka, Idaho and California stocks continue very dull, in spite of more favorable news from the mines than has been received for many months.

In connection with the Comstock mines the *Enterprise* of Saturday says: Those who have their money invested in mines which are already paying have little to complain of, as good dividends are again being paid by these, with no indication of any decrease, but rather of an increase in the amount. Not only are the old levels of our ore-producing mines yielding well, but the explorations made show that the new levels yet to be opened up are likely to prove still richer. New mines are steadily being added to the list of those that are milling ore, and if they are not able at once to pay dividends it is still a comfort to know that they are doing much toward paying for the work which is being done for their further development. Quite a number of mines are just now in this stage. All that is required to make them dividend-paying is a lucky discovery or two, or a constant and steady increase of richness—and perhaps in size—of the ore bodies already discovered. Our prospecting companies—even such as have yet no ore at all—are all in excellent spirits and are doing a vast amount of good work—are everywhere going down to depths never before attained, and, at suitable intervals, are sending out drifts for the thorough exploration of their ground. From the Utah on the north to the Daney on the south, the greatest possible activity prevails; as also in the direction of American Flat, where a number of companies, each provided with first-class machinery, are doing excellent work.

BLANKET SLUICES.—The Woodworth mill, running on Dayton ore, says the Virginia *Chronicle*, situated near the mouth of Gold Cañon, have completed a set of blanket sluices 1,700 feet in length. The string is made up of twelve compartments or separate sluices, each 19 inches in width. The bottom of each compartment is covered with blankets for catching sulphurets. It is estimated that the whole string of sluices will catch about forty tons per day of concentrated tailings. All the water and tailings passing down Gold Cañon will run through the sluices.

GOOD AIR.—The 1,200, 1,300 and 1,400-ft. levels of the Consolidated Virginia mine now have good air throughout, with the exception of one or two places. This is a great relief to the miners, who have been working on these levels during the last three months when it was hot enough to roast them alive.

MINING PATENTS.—In the case of the Cash lode, of Colorado, the Commissioner of the General Land office rules that in applications for patents under the mining laws proof of citizenship is not required of the original locators or intermediate owners of mines, but only of applicants for patents.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

OWN WORK.—*Chronicle*, Sept. 12: We understand that no more custom ore will be worked at the M. and N. W. mill, as it will be strictly confined to ore from the Silver Glance mine.

EXCHEQUER.—The Monitor and Northwestern mill produced a 980-fine brick from the Exchequer ore. It was roasted in the McGlew furnace.

SILVER CLOUD.—The shaft of this mine is down 80 ft., and progressing finely.

TARSHISH.—Ore from this mine paid $30 per ton. It was worked at the M. & N. W. mill.

AMADOR COUNTY.

MCKAY & LOVE MINE.—Work on this mine is progressing finely, and the prospects continue to be more flattering as the work of development progresses. The lower tunnel is now in 180 ft., and from the mouth of this tunnel rock can be landed at the road ready for transportation to the mill. It is expected that they will commence taking out rock in large quantities for milling purposes in a short time.

CONTRA COSTA COUNTY.

QUICKSILVER.—*Gazette*, Sept. 12: It is some eight or nine years since anything has been done with the quicksilver mine at Mount Diablo; and we learn that a San Francisco gentleman of ample capital has made arrangements to resume work there, and eystematically open the mine. This mine has afforded good prospects, and has actually yielded some quicksilver for market. There is much reason to believe the mine will prove handsomely remunerative with judicious working, and the employment of sufficient capital to open it properly.

EL DORADO COUNTY.

THE MANSFIELD.—*Republican*, Sept. 10: Is it a hilk? We know nothing of this mine personally, but made favorable mention of it recently on the statement of the superintendent. Since then we have been shown rock purported to be the best produced from that mine, and was certainly not creditable. We hope the owners of this mine are not putting up a job, as the interests of the county have already been jeopardized to too great an extent by tricksters.

RUSHING THINGS.—Capt. Woodworth is just making things hum over on the Young Harmon. It is scarcely three weeks since he made the first move to get his machinery and lumber on the ground, and about another week will suffice to finish up construction, and get everything in working order. We were over there on Saturday, and found the batteries and ten stamps all set and well enclosed; the boiler and engine being put in place—the mill is to be run by steam—and a large amount of wood cut and piled up, taken from the claim. There is a large amount of milling rock now out, but as to its richness we are not able to state, though out of a number of pieces picked up indiscriminately we could see gold in all but two. The mill will be started up in a few days on this ore, and at the same time the ledge will be worked at three different points, from all of which the ore is conveniently accessible to the mill, which is admirably situated for both receiving and discharging.

INYO COUNTY.

SYLVANIA.—*Independent*, Sept. 12: The Marotte Bros. and Kincaid, in Sylvania, expect to fire up their little furnaces for a brief run the coming week. No new developments of importance have been made in that camp, yet the general look out is more encouraging than ever as regards the value and ease of working the ores. If reasonable expectations are realized, and large quantities of the ores are developed, which can only be done by considerable expenditure of money, Sylvania would at once loom up as one of the very best mining camps in this whole country. There are no ores any easier of reduction or richer, nor any camp with better natural facilities generally. The only question is as to the extent of the bodies of the ore. At Pine mountain about the same condition of affairs exist. Moffatt & Co. are running three shafts constantly on their tunnel, but do not expect to strike the ledge for some weeks yet. Albert & Berry are taking out quantities of splendid ore, and have a mine considered worth not less than $30,000.

FROM BENTON.—The mills are running steadily and making their regular shipments of bullion every week. Mr. Wetherill shipped nine bars last week, weighing 100 lbs. each, and worth $12 per lb. The mines are all looking very well, except the Yellow Jacket, and that is looking better. Mr. Mitchell, superintendent, informs us that they have struck quite a large vein of ore, and that it is rich is understood as it is Yellow Jacket.

KLAMATH COUNTY.

SAWYERS' BAR.—Cor. Lake Co. *Bee*, Sept. 10: Gold Hill would be an appropriate name for the mountain which contains within its bosom such mines as the Black Bear, Yellow Jacket, Klamath, Evening Star, Star of the West—and recently discovered Monitor. The old Live Yankee, cut off short and moved by gigantic natural forces, appears to have swung round on its axis and the main ledge shall some day be discovered by following the well defined

foot wall which still remains. The Humphack is thought to be an extension of the Live Yankee, but there is not enough known by development to speak with certainty. I think that the Klamath mine, under the management and close supervision of Mr. John Daggett, will do much to develop the worth and stability of this district. The mine never looked better than at present, nor offered more substantial proofs of its sterling value. The ledge is steadily increasing as they follow it down, both in width, extent and richness. Should this development continue and its prospects be as good as at present, the milling capacity (32 stamps) will be doubled next year. The track from the mouth of the tunnel and incline to mill is 3,000 ft. long; yet quartz can be carried the whole distance and delivered in mill for 35 cts. per ton. Should the milling powers be increased, it is thought that the ore can be delivered for 30 cents per ton. Should this ledge continue to develop as it is doing at present, in less than two years there will be 100 stamps in motion. The district is young and its resources are not fully tested. If the Klamath ledge should prove a success, as I have no doubt it will, this will be one of the busiest mining regions in the State.

MENDOCINO COUNTY.

IRON.—*Dispatch*, Sept. 12: Messrs. Burgers & Wortenberg have discovered and are now testing the extent of a lead of iron ore on the western extremity of our town. As they progress the prospect is favorable. The ledge enlarges and the character of the ore improves. Taking the cue from this discovery, some young men have traced the ledge something near a mile and a-half to the northwest of the original discovery; and, as we are informed, have made some superficial prospects which indicate even a better prospect than the original discovery. It is said the metal is of that peculiar character from which the finest steel is made.

ABOUT a month since William Shoemake, of Point Arena, discovered a gold ledge on his place. On last Thursday he found a rock with gold in it that could be seen with the naked eye. Who can tell what our county may yet prove to be?

NEVADA COUNTY.

OMAHA MINE.—*Union*, Sept. 12: Work in sinking the shaft at the Omaha is progressing very favorably, and the shaft is going down through a ledge which is from two and a half to three ft. in thickness. The walls of the ledge are perfect and beautifully defined. The rock in the shaft shows well, and the experienced miner who has the job of sinking the shaft would be very willing to take the quartz which comes out of the shaft for his pay in doing the sinking.

N. S. MUCHMORE has made a discovery of a very rich quartz ledge on Deer creek, near the Dikemau dam, four or five miles northwest from this place. He has located 1,500 feet on the ledge, including dips, spurs and angles. The location commences at a point about 150 ft. from the creek and on the north side of it. The rock of the ledge has been tested by panning out some of the croppings, with these results: Six pans of the quartz gave gold to the value of $106, and a subsequent two pans gave $60 worth of gold. The ledge is from 18 ins. to 2 ft. in thickness on the croppings.

SEVEN-THIRTY MINE.—*Union*, Sept. 16: This mine is looking well, and rock with plenty of gold in it is being taken out.

IDAHO.—*Transcript*, Sept. 12: Owing to extra expense now being incurred by this company in building and putting in pumps for deeper sinking, the monthly dividend paid this week by the banking house of Findley & Co. was only $5 a share. Ten is the usual amount. The foundation of the new pumping works is a model for strength and permanency, showing that the management have no fears regarding the capacity of the mine to furnish bullion for many years to come.

THE Manzanita gravel claim near Nevada City temporarily stopped piping last week on account of scarcity of water, and a clean-up is being made which it is thought will turn out over $50,000.

THE Providence mine continues to be the largest vein of ore in the county, and we think in the State. It carries enough gold to make the whole of the immense body of quartz pay for working at a profit to the owners. As it is sunk upon it grows better.

NAPA COUNTY.

PINE FLAT.—Cor. *Register*, Sept. 12: The Fleetwood mine is situated about half a mile above Pine Flat on the Pine mountain road. This mine was worked some eight years ago, by Gran Thompson, who, after expending a few thousands on it, abandoned it. Two years ago it was re-located by W. R. Williams and others, who, until recently, have done but little work upon it. About one month ago it was incorporated, and the company put a force of men to work, running two tunnels in order to tap the main ledge at right angles. At the Georgia a large force of men are at work taking out very rich ore. This company has an immense amount on their dumps, and are now making arrangements to build a furnace. Next above this is the Bacon mine. Mr. Pasco is the superintendent, in the absence of Mr. Bacon, who has gone to England. Passing over Pine mountain we soon come to the American mine, owned by Messrs. Wright Bros. This mine was first owned by John Pershbaker, then by Cross & Co., who sold it to the present owners. An old furnace was on the ground, but the present owners concluded to erect new works, which they did, in the shape of a 10-stamp mill and 4 benches of retorts, each bench containing 3 retorts; but as the iron was either very poor, or the men who had charge of them knew nothing about the business, in a short time almost every retort busted, and Capt. Wright informed me that he was confident that they had lost $20,000 by these retorts. They intend to erect a large furnace immediately.

ETNA COMPANY'S MINES.—The company are now running their furnace with good results. A strike of splendid ore has just been made in the Silver Blow mine, which is said to be superior to anything hitherto found in that claim.

PLACER COUNTY.

THE ORLEANS.—*Argus*, Sept. 12: We were shown the other day several pieces of ore from the Orleans mine that for richness excel anything we have ever seen taken from a Placer county mine. The gold was very evenly diffused throughout the rock, and was visible in large quantities. Every portion was covered with the glittering particles, and one small piece, weighing not more than two or three pounds, was estimated to contain over a hundred dollars' worth of the precious metal. The whole ledge is showing free gold in large quantities. The prospect in this mine is growing better every day.

THE RISING SUN MINE.—Over $300,000 have been taken out, and fully $100,000 of this has been clear profit. Heretofore the mine has been worked on rather a small scale, there being but a single battery of five stamps, and a single shaft. A new shaft has been sunk about 100 feet east of the old one. It is down 500 feet, in good paying ore, the ledge being fully two feet in thickness. The shaft is 12 ft. by 4½, giving a double hoisting shaft, and a compartment for the pump and ladders. A new building, large and well designed, has been erected, in which a new engine, in addition to the two now in use, will be erected, furnishing ample power for hoisting, pumping, and driving the stamps. A battery of 10 stamps is likewise being erected. The entire cost of the improvements this season will be about $30,000. We examined the ore that is taken out, and find it to be uniformly rich. There are no "specimens," the gold being diffused quite evenly through the rock, but the whole ledge pays well for working, and with the amount now in sight gives solid assurance of paying well for an indefinite length of time. Every piece of rock we examined showed free gold, evenly distributed, and in satisfactory quantities.

NEW COAL DISCOVERIES.—*Herald*, Sept. 12: Various parties were prospecting for additional coal beds in the vicinity of Lincoln. The result has been most satisfactory, as appears from the following, which we have received from a friend who knows of what he speaks: Mr. Scott, a San Francisco capitalist, with a party of men has been prospecting for coal around here for the last two weeks. After several unsuccessful borings, lignite coal of a superior quality was found upon the lands of J. D. B. Cook, of this place. It was found 55 ft. below the surface, and was 20 ft. thick.

PLUMAS COUNTY.

GOOD PAY.—The North Fork Co., on Dutch hill, are running three eight-hour shifts in one tunnel, and the gravel is paying at the rate of an ounce to the car-load. When the ditch is finished and the company commence working that kind of ground with monitors, there will be some "big pay" to record.

RICH STRIKE.—M. A. D. Hallsted informs us that a discovery has recently been made on Rich gulch, by Capt. Corser and others, which bids fair to be a very important one. This gutch was immensely rich when first worked, years ago, and at a certain point the lead was lost. A number a new claims have been located, and work will be pushed ahead briskly. We hope thet it will prove as good as anticipated.

BADLY SOLD.—Quite an excitement was kicked up among the La Porte-ites, last week, over the discovery of a cinnabar deposit, near Little Gress valley. Specimens of the ore showed quicksilver in prodigions quantities, and claims were located—some of the parties showing wonderful strategy in getting to the ground without being observed. One lucky (?) owner remarked, that "if worth a dollar, it was worth a million," and stock was "high up" for a short time. Some prospecting revealed the fact that the specimens had been "salted," and the gilded dreams of the millionaires dissolved into thin air.

SISKIYOU COUNTY.

BLACK BEAR.—*Union*, Sept. 12: There are now on the pay roll of the Black Bear mine 104 men. Besides there is a considerable number chopping wood and getting out timbers, whose names do not appear on the pay roll. The whole number of men now employed at the Klamath mine is 50. The new batteries which are being brought up for the Black Bear mill—for the sixteen new stamps that are being put in—are four in number, and weigh 2,000 pounds each. Deacon Lee hauls them over from Callahan's by the South Fork route. Two of them are already over, and two have yet to be taken.

GOOD PAY.—Collins, Pullen & Co. are taking out of their claim on Oak Bar splendid pay, some days as high as 18 ounces. We learn also that they have offered Ship & Gregory, with whom McConnell & McManus of this place are interested, $1,000 for twenty feet of the upper end of their claim.

ELIZA MINE.—Rock of excellent character is being taken out. The company we believe have had it in contemplation to put the mill in good repair and commence to crush at an early day. The ledge is now about 18 inches thick.

SONOMA COUNTY.

QUICKSILVER.—Petalnma *Argus*, Sept. 11: Cinnabar discoveries continue to be made in this county with encouraging frequency. A company is prospecting on Malone's ranch, Sonoma mountain, about 10 miles from Petaluma. There are good indications.

SANTA BARBARA COUNTY.

STRUCK IT RICH.—Reese River *Reveille*, Sept. 8: We are informed that John F. Cassell, formerly superintendent of the Belmont mine, has struck it rich in the vicinity of Santa Barbara. He leased for a term of ten years, with the privilege of purchase, a Mexican grant, on which there has been discovered an immense ledge of cinnabar, containing a 3-ft. pay-streak, averaging 30 per cent. of quicksilver.

TUOLUMNE COUNTY.

THE MORSE MINE.—*Independent*, Sept. 12: Owned by Thomas J. Evans, situated near the Riverside, is now turning out some splendid rock, showing free gold all through, which pays $100 per ton. The vein varies from two ft. in width to an average of 18 inches. There are several chutes developed, some of the rock looking as if burned—being of a deep blue-black color, showing black crystals and carrying lead and other minerals. There is no difficulty experienced in saving the gold, which amalgamates readily with the quicksilver. The five-stamp mill runs night and day, and there is enough pay ore in sight to keep the mine running for a year.

NEW MINING ENTERPRISE.—Thos. Morris, of Jeffersonville, contemplates opening the Boston claim in Table mountain, this winter, with hydraulic, which has hitherto been worked as a "drill claim" with good profit. This claim lies between the Buckeye and the Slate claims, the channel having been broken out at the lower end of the Buckeye and run outside, spreading out some 600 ft. and running down to within 500 ft. of the State of Maine—the bluffs taking a crescent shape, and leaving in all about 40 acres of gravel on the outside—the channel again enters the mountain bluff and runs down the mountain to the Blue Gravel, etc. They propose to lay a bed-rock flume with a grade of 7½ inches to the rod, and will get water at the Peppermint Falls, from the Hydraulic mining company's ditch. They will use a stream of 250 inches of water, which will be conveyed in a 10 inch pipe to the mine, with a pressure of 250 feet. To get the water from the falls to where it enters their pipe will cost about $500.

TULARE COUNTY.

MINERAL KING.—Cor. *Times*, Sept. 12: Ore has now been found on six adjoining claims on White Chief lode, namely: Discovery claim; claim No. 1, south; Nos. 1, 2, 3 and 4, north; and in each case near the line of granite on the west lode, and the phospbate of lime on the east. This assures us of the fact that a continued line of galena pre-exists on said lode on the surface for three miles, and the tunnel now being run on the Loop claim reached ore at the depth of 85 or 90 ft. below the surface. We think the evidences good for a lively camp in Mineral King next season. We also learn that certain parties from Visalia and New Jersey have recently purchased interests in said districts, and design to commence running a tunnel immediately 300 ft. in length, which, when completed, will tap the ore vein 250 ft. deep; name of the lode withheld by request.

Nevada.

WASHOE DISTRICT.

CROWN POINT.—Gold Hill *News*, Sept. 10: The main incline is down to the 1,600-ft. level, at which point a station is being put in preparatory to drifting for the ledge. The main south drift, on the 1,500-ft. level, is still vigorously driven ahead without change of value to report. The only cross-cutting done on this level yet, is an east cross-cut run 250 ft. north of the Belcher line, which cut through a body of rich ore 35 ft. wide and was then stopped for want of proper ventilation. As soon as that is obtained the development of the level will be continued at once. The connection of the new air shaft of the Belcher mine with the upraise will already produce a favorable effect, and will no doubt greatly benefit the entire mine. Prospecting operations on the 1,000-ft. level have also shown that the ore body on that level extends 75 ft. further to the northward than had ever been looked for, and is of a quality second to none in the mine. This is a valuable discovery, and will add greatly to the wealth of the mine. The ore bodies being worked on the 1,400-ft. level are extending further to the northward than on the levels above. The machinery is all working finely, the mills are all running steadily, and the future prospects of the mine are good for many months to come.

CONSOLIDATED VIRGINIA.—The completion of the north drift on the 1,500-ft. level from the Gould & Curry shaft and its connection with the north winze has greatly cooled the different levels of the mine and increased the facilities for the extraction of the ore and the comfort of the miners. The ore breasts both north and south on the 1,300 and 1,400-ft. levels are yielding finely, and never looked more promising than at the present. The ore extracted is all of high grade, none of the car samples during the past week running below $108—average assay value. The pocket of water struck a short time since in the main south drift on the 1,200-ft. level is about entirely drained. The south drift on the 1,500-ft. level made the connection with the north drift from the bottom of the north winze this morning, forming a complete ventilation of the 1,500-ft. level. The erection of the new mill is progressing finely. All the frame timbers, the foundation timbers for the machinery, and the battery blocks are finished, ready to be put in place. The frame work of the ore house and battery rooms is already erected, and nearly the entire machinery is on the ground ready to place in position.

DAYTON.—The extraction of ore is again being vigorously prosecuted on both the second and third station levels. Some excellent ore was found in a winze a short distance further to the northward, in the early workings of the mine, and it is confidently expected that when this drift reaches a point under the former workings, that some good ore developments will be made. Daily yield, 50 tons of ore, keeping the Woodworth mill steadily running.

WOODVILLE.—The ore in both the northwest and southeast drifts from the main north tunnel on the 200-ft. level still continues of a fine quality. Sinking the winze from this level to connect with the level below is making good headway, the rock in the bottom working finely, and the north side of the winze occasionally cutting bunches of fine ore. The ore development in the north drift on the 300-ft. level still continues of a fine character and an excellent quality. The body is widening as the drift progresses to the northwest, and promises a good development by the time the drift reaches a point perpendicular with the ore development on the level above.

SUTRO.—Clay slips and streaks of quartz are frequently encountered and there is a strong increase in the flow of water from the face of the drift. This seems an undoubted indication of an approach to a ledge, although it remains to be yet determined as to whether it is the main ledge.

UTAH.—The flow of water still continues so strong that no effort whatever has yet been made to resume sinking the main shaft. The north drift on the 400-ft. level is still driven vigorously ahead, following the ledge and occasionally encountering some very promising streaks of quartz.

KOSSUTH.—Sinking the main shaft is making fine progress, the rock in the bottom working well. The new machinery is all working splendidly, and only about six strokes of the pump to the minute are required to keep the water out.

INDEPENENT AND OMEGA.—A contract has been let to sink the new shaft of the company 100 ft. deeper. In the old tunnel, run near the surface some years ago, the ledge proved to be 80 ft. in width, assaying from $6 to $10 per ton. The chances of finding something valuable at a greater depth are certainly promising, and of sufficient inducement to warrant the further prospecting of the mine.

GOULD & CURRY.—Work has been temporarily suspended in the north drift on the 1,700-ft. level. Cutting out for a station in the north drift on the 1,500-ft. level, for the purpose of sinking a winze near the north line to connect with the north drift on the 1,700-ft. level, has just been commenced. Prospecting at the fourth station level is still continued without change of interest to report.

CHOLLAR-POTOSI.—Daily yield 100 tons of ore, the assay value of which is $31 per ton.

FLORIDA.—Excellent progress is being made in sinking the shaft, which is down already 200 ft. Numerous stringers or seams of quartz are met with, some of them carrying a small quantity of metal.

JULIA.—Most of the new machinery is on the ground ready for erection, and will be placed in position as fast as the foundations are completed.

OVERMAN.—Driving the north drift on the 1,200-ft. level is making steady progress, with no material change to note. The face of the drift is still in ore and quartz of a very promising character. Sinking the main shaft is making steady progress.

CALIFORNIA.—The north drifts on both the 1,400 and 1,500-ft. levels are still driven vigorously ahead to connect with the corresponding drifts now being run on the same levels from the Ophir.

SAVAGE.—Sinking the south winze from the 2,000-ft. level, to connect with the south drift on the 2,100-ft. level, is making good headway. Sinking the main incline, for a new level, is making fine progress.

IOWA.—Work will be resumed on this mine next Monday. The old Iowa tunnel, in a distance of 130 ft., will be repaired and then driven forward to cut and prospect the ledge, which it will do several hundred feet below the surface.

SIERRA NEVADA.—The ore breasts in the old upper workings are still giving a good yield of ore. The mill is kept steadily running on ore from the mine.

OPHIR.—Daily yield, 50 tons of ore, keeping the Empire State mill steadily running, and gradually accumulating a large surplus of ore. The ore breasts on both the 1,300 and 1,400-ft. levels are looking well and yielding splendidly. The ore extracted is of a high grade, and there seems no longer a doubt as to the Ophir soon becoming again a dividend paying mine. Winze No. 1, on the 1,300-ft. level, is still in rich ore, also the north winze from cross-cut No. 2, on the same level. The east cross-cut from the south drift on the 1,465-ft. level is expected to soon tap the east ore body.

NORTH GOODMAN.—The tunnel is now in 200 feet, the face in hard blasting rock. Occasional streaks of quartz assaying as high as $30 to the ton have been passed through, and the tunnel is expected to strike the ledge at a distance of 300 ft. from the mouth and 500 ft. from the surface.

HALE & NORCROSS.—The main incline is down 123 ft. below the 2,000-ft. level, the rock

[Continued on Page 188.]

Collom's Separating Works.

A brief trip to the Collom Sepsrating Works this morning convinced us, says the Central City (Col.) *Register*, that without any exception this is the busisst establishment in the country. It has more pulleys, wheels and shafts; more dancing jigs and revolving cylinders, and keeps a larger quantity of water in motion than all the quartz mills in the land. Everything denotes active industry. The men go about their work silently, for amid all that wilderness of machinery there is neither time nor opportunity for conversation or story telling. Looking upward from the ground floor, the eye is both amazed and bewildered by the vast combinstion of forces employed in the process of crushing, distribution, sepsration and concentration of minerals carried on by John Collom's invention. Away up on the mountsin side, almost as far as the eye can reach, sre men, jigs and cylindrical machines, and crushers innumerable, all operating like clock work, in perfect harmony snd with wonderful force and efficiency. At the very top the ore is delivered from the wagons into the mill. It goes first into a funnel shaped chute, slides thence down to the Blake cracker, from that to different sets of improved Cornish rollers, thence into sizing machines, thence into rotary sieves, thence through a series of jigs and dressing tables, propelled from the start by small streams of water, until the final deposits of the different minerals and metals are made in the concentrstion tanks, at the very bottom floor of the huge building. From the time the ore is passed into the crnsher, no hand touches it, or direc'sits progress, until it is ready for delivery to the ameltera. Each grade of minersl finds its way, with invariable precision, to its appropriate receptacle. The machinery is so arranged as to carry on the material through a vast multitude of changes to its final delivery, without the interposition of msnual labor at any point, and no mistske is made, no matter what the character of the ore may be.

Situated on north Clear creek, on the ground formerly occupied by what is familiarly known as the "Keith Process," it has grown, under the skillful direction of the inventor, into vast proportions. No one who has not visited the place can form any proper conception of its magnitude. It reminds the beholder of some great Eastern manufactory, upon whose wares half a continent is depending. Notwithstanding its newness snd its experimental character, it is already largely pstronized by the miners. A steady stream of wagons, freighted with ores of different kinds and gradea, except the highest—which always go to the smelter—is passing up and down the Clear creek road to and from this mill. Prof. Behr, a well known chemist and assayer, is in charge of the scientific department. He is thoroughly confident of the utility of the process, pronounces its work excellent, and is sanguine that it will grow into one of the most useful institutions ever established in this Territory.

Dry Canon Mines.

A correspont of the Salt Lake *Tribune*, writing from Jacob City, says: I have just been visiting some mines upon which considerable work and expenditure of capital has been made, placing them in a position where, in the next 60 days, they may be classed among the leading mines of Dry cañon.

The Daniel Webster lode, which is located on the northeast side of Snow Storm hill, is engaged in sinking an incline on the vein, which is now in 35 feet, showing ore on both sides and overhead averaging three feet, two feet of which is good ore. The vein in the face of the incline is four feet in width, three feet of which is good ore, the character hsing yellow carbonate, galena and black snlphurets, the assays of which vary from $60 to $80 in silver, and 45 per cent. in lead. There are about 15 tons of ore on the dump, some of which is fine yellow carbonate ore which has been sacked. A good trail is being built from the sag of Lillie hill to the mine. There is also a large quantity of timber close at hand, and several springs of water within 400 yards distance. This prospect is one of the finest we have seen in the district for the amount of work done and the distance attained.

The Silver Crown is looking remarkably well; an incline is in about 70 feet, showing a large body of ore all the way down to the face, where it takes a dip into the hill. The owners, Kirk, Converse & Co., are vigorously engaged in developing this mine.

The Enreka, located on Treasure hill, still continues to take out good ore, and is making regular daily shipments without interruption.

The Gisborn toll road is nearly completed, and in the short space of ten days ore teams will be seen wending their way along the new road with precious ores from Dry cañon. There is a rumor that the stage company will run over the new road when completed.

The suit of ejectment against the Cambria mine, by the agent of the Jupiter miue, resulted in a verdict by Judge Bethune in favor of the Jupiter company. The case, however, is not fairly settled; the Cambria folks propose to see it clear through.

Cleansing Wool.—A recent English patent is for a method of cleansing wool and the disintegration of vegetable matters by the successive action of acid and alkaline gases, such gases being those obtained in any industrial process, but particularly in the manufacture of chemical products and manures.

Bingham Canon.

A correspondent of the Salt Lake *Tribune* writing from Bingham Cañon says: Bingham's great minersl belt, which is unparalleled, and second to none in the world in quantity and quality of ore, for over four miles in length, and is producing over two hundred tons of ore per day. There are some 25 or 30 mines located on this mineral belt. Only nine or ten of these mines are being worked at present, among which sre the Jordan and Galena, Neptune, Kempton, Lsst Chance, Nez Perces Chief, Spanish Utah, Yosemite, Wssatch and Sampson. These mines are producing immense quantities of ore, and yielding rich returns to their owners.

There are nearly 20 valuable mines on this belt which are lying idle for want of capital to work them, among which may be mentioned the Gentile, Telegraph, Revere, Captain Jack, Giant, Montreal, Star of Utsh, Aahlsnd, Snltan and others. These are all excellent mines, and with a little capital to develop them, and proper management, would return large incomes to their owners.

The average valne of ore produced by these mines is $50 per ton, for lead and silver. The few mines mentioned above, although not worked to half their capacity, are shipping 200 tons of ore per day, or in s year of 365 days 73,000, which at $50 per ton would be $3,650,000. And as there are about 250 men employed in the mines, it would average $14,600 per man.

Considering the present undeveloped condition of the mines, this is certainly very encouraging to owners of mining property. What the returns will be when these mines are developed to the extent of the Comstock lode of Nevada, it is impossible to estimate.

Miners and owners of mining property should not be discouraged on account of the small amount of capital that has been invested in mines during the past year, which has no doubt been owing to the unsettled condition of the financial world since the panic. There is no doubt that before snother year the unlimited mineral wealth of these mountains will induce a large amonnt of capitsl to be invested, and the mines more fully developed and worked to their capacity.

Owing to many schemes and frands perpetrated on the puolic, by a class of scoundrels with which the country is infested, mining as a business has been brought in disrepute, but in the face of facts and statistics of mining in this country, as well as every other, it is easily proved to be as legitimate as manufactnring or mercantile bnsinesa, and when properly and legitimately managed, to be the most remunerative of any business carried on in the world.

American Steel.

In my travels throughout the conntry I am repeatedly asked, why not make as good steel in this country as in England? I admit that such a question might have been pertinent ten or twelve years ago. The steel trade of this country was then in its infancy—inexperience had to battle against a country of a century's growth in the trade, and we may add that there has been improvement in English steel for more than half a century, while in America the short space of fifteen years has raised her to a standard of success surpassed by none in the world. We assert, and that fearlessly, that America cannot at present be surpassed in her manufacture of steel. Why should she? Her artisans are as intelligent as any on the globe, quick to see and ready to act, in fact the personification of true business, while her process is the same as in England, and the stock used equally as good. To raise the country to an equal popularity with Sheffield only requires the destruction of a needless and nnwarranted prejudice, which is happily fast dwindling away. I have had twenty-five years' experience in the steel trade in Sheffield and in this country, and know whereof I speak, and I predict ere long Engliab steel will be unknown in American markets. Let us encourage, then, the industries and support the productions of home, and thereby give our mechanics a fair chance in the great battle of life, and the result will be the envy of surrounding nations and the astonishment of a gazing world.—*Cor. Chicago Times.*

Tapped a Pocket.—A few days since a drift which is being run by the Consolidated Virginia Co. on the 1,165-foot level tapped quite a large pocket of subterranean reservoir water. The spot where the water was found was in the "east country" on or near the Best & Belcher ground, and is in no way directly connected with the Consolidated Virginia proper. The water flows along the drift on the 1,165-foot level til it reaches a winze near the Gould & Curry line, when it falls to the 1,300-foot level and flows into the last named mine. The Gould & Curry folks have a good deal of water of their own; besides, they have of late had not a little trouble with their pump, therefore a considerable portion of the water is allowed to flow down to the Savage, where it is pumped ont. The pump of the Gould & Cnrry was working well yesterday afternoon, and was rnnning at a very lively rate—apparently about its fastest stroke. It is supposed that the pocket will be drained in a few days. There are deep workings all about the spot where the water was found, which are quite dry, therefore it is supposed that the pocket is snrrounded on all sides by clay; indeed, they passed through clay before they tapped it.—*Enterprise.*

Iron in Utah.

A correspondent of the Salt Lake *Tribune*, writing from Tintic, says: We have heard considerable concerning the iron ores, etc., of the southern part of this Territory, and the probability of another Pittsburg existing there some day, but from indications that part of the oouutry will, eventually, be the proper supply point for the south generally, for Arizona and New Mexico, etc.; yet before that can be, there must be a railroad from the north there, and of necessity much time and capital be expended in ntilizing these now distant resources. Meanwhile, the northern demand for railroad iron and iron products is enormous; the Utsh southern railroad and all the narrow-gauge railroads in esse and in posse for Utah want iron, and there is no need to wait and get the gold to send East for it, if we will only utilize the resources at our feet, for, be it known, that there is an extensive belt of accessible ore in Tintic, of various grades, and immense quantities already in sight, of a quality and grade that competent judges pronounce equal to the best Pittsburg orea, and say cannot be excelled, so that all that is needed are the furnace means and appliances to turn out unlimited iron pigs, bars, or whatever is wanted.

The resources for water power in Provo, unequalled by any other place in the Territory, are handy, and should now be utilized for rolling milla, etc. There is money and reputation for those who are willing to take hold of this matter and help develop this great resource and basis of material prosperity—iron manufacture.

It should be observed that coke of A 1 quality can be procured from the neighboring coal mines of Sanpete. Tintic can hold her own for charcoal and building rock, and first-class brick material is abundant and handy.

We will willingly give such information as we possess on this subject to those seeking it, and mail herewith a specimen of iron ore from a recent 50-feet location. It is self-evident that if good and cheap iron can be produced here, it will marvelously forward the material growth and prosperity of Utah.

Mind and Brain.

Dr. B. G. Wilder, in a paper read before the American Scientific Association, criticises the methods of studying the relations between brain and mind. The phrenological method is defective, because anatomy does not show any definitive correspondence whatever between the folds and fissures of the brain and the outer surface of the skull, and because the most expert phrenologists often fail to define character by the head. As for the psthological method, which compares brain-lesions with mental phenomena observed during the life of the individual, there is good reason for supposing that peculiar mentsl conditions may exist without recognizable brain-lesion, and *vice versa*. And Brown-Sequard says that all parts of the brain may, under irritation, act on any of its other parts, modifying their activity so as to destroy or diminish, or to increase and to morbidly alter it. The experimental method, which irritates or destroys certain cerebral regions in living animals, merely demonstrates the existence in the brain of centers of action for different sets of muscles; it necessarily produces abnormal action, and fails to show the relation between brain and mind. Dr. Wilder would follow the example of phrenologists, but employing the brain itself for comparison, instead of the skull, using large numbers, and comparing the two sides. He would also employ canine instead of human brains, because of their simple fissural pattern, and the possibility of an accurate knowledge of the mental characteristics of dogs. Better results might be expected from the study of the brains of persons with whom we were acquainted in life, but that is impracticable. Dr. Wilder does not believe in the localization of faculties in different portions of the brain, and inclines to the opinion that a cerebral hemisphere acts as a unit either singly or with its fellow.

Coal Areas.—Coal is still the prime source of anxiety. In Europe the coal area in square miles stands approximately thus: Great Britain, 5,500; France, 1,000; Saarbruck, 900; Belgium, 500; Bohemia, 400; Westphalia, 350; Spain, 200; Ireland, 150; Russia, 100. The British possessions occupy 7,000. The United States 200,000. But quantity is one thing and value by accessibility another. Great Britain commands the sea-board, and holds available coal, ironstone and limestone in juxtaposition, besides convenient appliances, which is scarcely the case elsewhere; so that, let labor-value fluctuate as it may, her furnaces will of necessity hold their own against the world for a long time to come. The world's yield of coal is about 200,000,000 tons annually.

Quick Work.—One week ago last Monday evening an order was received at the Gold Hill Foundry, George Emmet proprietor, from the Sierra Nevada Mining Company, for a suction pump to be used in the bottom of their shaft as a sinking-pump. Work was begun on the pump the next morning after the order was received and last evening the pump, completed and ready to set up, was delivered at the mine. The pump is ten inches in diameter (10-inch bore) and is a fine specimen of workmanship. The completion of the pump in the time mentioned, is about as quick work as we have heard of in that line of business.—*Enterprise.*

Quicksilver Road.

In our article last week we neglected to give the distance from Woodland to the mines, or rather the extent of road the county would have to build. From Woodland to the point where mountain grading will commence is thirty miles. This point is at the farm of Henry Rhodes. From that point to the mines is six miles—one mile of which is level ground across Casey's flat. The summit is the point to which the county will be required to build, which is three miles—the two miles beyond will be built by the California Quicksilver Mining company. It is therefore but thirty-six miles from Woodland to the Knoxville mines. The report of the viewers is very flattering, and the surveyor, Mr. Nurse, tells us that, although he did not venture to give any estimate as to the probable cost from the meager time occupied in taking observations, he did not think it would cost the county over $5,000. He says the grading will be very easy, and that the road-bed will be of material sufficiently durable to admit of constant wear by heavy wagons for years.

The demand for this road is one which the county makes. It is not alone for the benefit of the people living in Capay valley, but for the people of Yolo county. This is the view that ought to be taken of it by the board of supervisors, and the most prompt action should be taken to commence the work. We understand that the grading of the road from Knoxville to Calistoga is dragging heavily, and that the contractors are becoming disheartened. They feel that it is not the outlet demanded by the people in the mines, and fear that it will suffer the same from wear snd washing that the road from Napa has suffered, and thus be half the time impassible, and a constant tax upon the people to keep it in order. These representations suggest activity on our part.—*Yolo Mail.*

The Booth Mining Co.

In speaking of the incorporation of this Co. the Placer *Argus* says: The object of the company is to work the Orleans, or Gordon gold mine, situated within a mile of Auburn. We are gratified at being able to announce that such a powerful combination of capital has taken hold of this valuable mine, as it will open up a new era in the mining and business interests of Auburn. The Orleans has been sufficiently tested to demonstrate that it is one of the richest mines in the State. Its original owners, though thoroughly convinced of its immense value, were unable for the want of adequate capital to properly work it. We do not know on what terms the new company has acquired the property, but suppose that Mr. Gordon and his friends have retained a large interest, and understand that he will be the superintendent. With ample means to develop the property, and erect the necessary works, we are confident that it will soon take rank as one of the important mines of the coast. Its development cannot but be of great advantage to Auburn. A reliable, permanent, dividend-paying mine, as it is almost sure to prove, will not only give stability to our present business, but will add largely to it. The incorporation of this company means business. It will bring to us capital and workmen, infuse life into every branch of trade, and set things to moving after the fashion of the flush times, when Auburn was the headquarters of thousands of prosperous miners.

Ogden Iron Works.—An Ogden correapondent writes the Salt Lake *Tribune* a letter descriptive of a visit to the site of the Ogden Iron Manufacturing Co.'s works. The company have purchased a piece of land, between 30 and 40 acres in extent, in the northwestern portion of the city, contiguous to the Utah Northern and Central Pacific railroads. A large amonnt of machinery is already on the ground, and a strong force of builders and laborers, including 50 Chinese, are at work on the building. The blast furnace is to be erected under the direction of a Mr. Tait, an experienced and reliable English furnace builder. The manager and his assistant are spoken of as being eminently fitted for their work, and are forwarding the process of construction as rapidly as possible. The value of this industrial enterprise can not be over estimated, as the raw material exists in this Territory to an incalculable amount, and the supply of cheap iron nnderlies all industries. The people of Ogden may be congratulated upon having secured to themselves so important an enterprise, and we look to see growth and profit result to all.

New Air Chimney.—The Consolidated Virginia Mining Company are having a new air-chimney built. It commences at the third set of timbers below the top of the shaft, and extends 20 feet above the roof of the main building. Its dimensions are 4x8 feet in width and about 80 feet in hight. When completed, the hot air and steam from the mine, which now escape from the top of the shaft, causing great inconvenience and preventing the engineers from seeing the station-marks on the cable, will be got rid of, and better ventilation will be insured.—*Chronicle.*

New Engine.—The Julia mining company have received their new hoisting engine from San Francisco. It is 36-inch stroke, 20-inch cylinder and 100-horse power. The excavation for the foundation is completed, and as soon as the masonry work is finished, the new engine will be set up. The hoisting engine now in operation will be used to drive the new pump, which is being put in the mine.

Useful Information.

Value of Iron Waste.—A very important, but until quite recently neglected, constituent of the waste-heap, is the old iron, battered saucepans, old pails, rusty hoops, horse shoes, and nails from the road. All soldered articles have the solder extracted from them, as it is more valuable than the iron, and the cheaper metal is then melted. The horse-shoe nails are not mixed with the common cast-iron, as they are much sought after by gun makers, for the purpose of making stub-twist barrels. Scraps of iron, it is found, may be made very useful in securing the copper in the streams washing veins of copper pyrites. Pieces of battered iron are placed in tanks, into which these are collected; the copper, under these circumstances, incrusts the iron, and in process of time entirely dissolves it, so that a mass of copper takes the place of the iron, and the residuum, in the shape of a colored deposit, is at times taken out, dried and smelted. Thus, from the merest and apparently worthless waste, a large value is realized. — *Railway Register.*

M. Werdermann's Process for Reshaapening Files.—Well-worn files are first carefully cleaned with hot water and soda; they are then placed in connection with the positive pole of a battery, in a bath composed of 40 parts of sulphuric acid and 1,000 parts of water. The negative is formed of a copper spiral surrounding the files, but not touching them; the coil terminates in a wire which rises towards the surface. This arrangement is the result of practical experience. When the files have been in the bath 10 minutes they are taken out, washed and dried, when the whole of the hollows will be found to have been attacked in a very sensible manner; but should the effect not be sufficient, they are replaced in the bath for the same period as before. Sometimes two operations are necessary, but seldom more. The files, thus treated, are to all appearances like new ones, and are said to be good for 60 hours' work. M. Werdermann employs 12 medium Bunsen elements for his batteries.

Leaf and Flower Impressions.—Oil a piece of white paper on one side; hold the side that is oiled over a lamp or pine knot smoke till quite black; place the leaf on the black surface, as the veins and fibers of the leaves show plainer on the under part; now press it on all parts of the leaf with the fingers; then take up the leaf and put the black oiled sides on the page of a book (made for leaf impressions) with an extra piece of nice paper on the top to prevent smutting the opposite page; press it a few moments; they remove the green leaf, and the impression will be left on the page as beautiful as an engraving. Flowers of single corolla can be pressed in like manner. Many of the geranium leaves make beautiful impressions. The impression book can be made still more interesting by giving botanical classifications of each leaf and flower.

Indelible ink intended to be used with types or stencil plates, are generally made without nitrate of silver. The presence of a silver salt in a marking ink would necessitate the use of silver or silver-plated types and plates. The two following are recommended; 1. Sulphate of iron, 1 drachm; vermilion, 4 drachms; boiled linseed oil, 8 drachms. Triturate together until the mixture is perfectly smooth. 2. Sulphate of manganese, 2 parts; lampblack, 1 part; sugar, 4 parts, with water sufficient. The manganese, lampblack and sugar are first rubbed together into a fine powder and enough water is added to form a thin paste. When this ink is used, it should be allowed to dry on the cloth and then be well rinsed in water.—*Druggists' Circular.*

Cleaning Bottles with Fragments of Iron. Attention has been repeatedly called to the danger of cleansing bottles with shot, as is commonly done, many cases of lead poisoning having been caused by a stray shot left after the process. M. Fordos, in the *Comptes Rendus*, advocates the use of clippings of iron wire instead of the shot. They are easily got, and clean the bottles quicker and better than lead does. The iron is attacked by oxygen, but the oxide does not cling to the glass and is easily removed by rinsing. In cases where even the minute trace of iron left behind would be objectionable, clippings of tin may be used.

Disinfectant and Mouth-Wash.—A very weak solution of permanganate of potash will destroy instantly any taint from diseased teeth or imperfectly-cleaned plates, and should always be used to rinse the spittoon in hot weather every time it is made use of. It is cheap, satisfactory, almost tasteless, not poisonous, and quite free from smell. It may be satisfactory to some to know that this will remove the taint of smoking from the breath, if need as a month-wash.—*Hints for the Laboratory.*

Chloroform vs. Petroleum.—The addition of one part of chloroform to five of petroleum renders the latter incapable of combustion until the former has evaporated. In an experiment, a litre of burning petroleum spread out over a surface of ten square centimetres was extinguished by throwing upon it fifty cubic centimetres of chloroform.

Cured soap is made by using tallow for the grease and soda for the alkali.

Testing Milk.

Since it has become customary for milk dealers to endeavor to palm off on their customers a minimum quantity of real milk, mixed with a maximum quantity of water, under the name of milk, it is sometimes interesting to compare different samples of such milk for the purpose of determining the amount of water added. English chemists have devoted considerable attention to this subject, because there a law exists punishing adulteration in food and medicine, and we shall frequently have occasion to refer to their observations. The specific gravity of milk, as indicated by hydrometers made for the purpose, does not serve to detect carefully-conducted watering. The average density of good pure milk is about 1.032. Since milk fat is lighter than water, the more cream the milk contains the lower its specific gravity, while skimmed milk has a higher specific gravity than unskimmed milk. Hence it is possible to preserve the normal density in watered milk by first removing a portion or all of the cream, and then adding just enough water to bring it back to its original density. To ascertain the amount of water added, it is necessary to determine by analysis the quantity of fat present in the milk. John Horsley, F. C. S., accomplishes this in the following manner: A glass tube, 11 inches long and three-fourths of an inch in diameter, is graduated from ten inches down, one-fifth of its length, into ten per cent., or hundredths. A tablespoonful, 15 c. c. or 250 grains, of milk is first poured into the glass tube,; a similar bulk of ether is next poured in, and the tube closed with a thumb or cork, and agitated for four or five minutes. An equal measure of alcohol is next added and the whole well shaken for at least five minutes more, when, on placing it in an upright position on a stand, the oily or fatty matter will rise to the surface and can be easily read off. Each line will correspond to 4.15 grains of solid butter, as proved by experiment. Milk which has 10 per cent. of cream will show two lines of butter oil, or 8.3 grains, for 250 grains of milk. If desired, the butter may be drawn off and weighed in a small platinum capsule.

Mr. Wanklyn prefers to evaporate 5 c. c. of the milk to dryness in a weighed platinum dish over a water bath. The operation requires at least three hours. The residue equals the total milk solids, and averages, with example of good country milk, 12.45 per cent. This residue is treated with ether and heated to boiling, and the solution poured through a small filter, the operation of boiling and pouring off the ethereal solution being repeated three times. The solution of fat is placed in a larger weighed dish, and the ether gently evaporated by placing it in warm water. When, toward the close, it becomes turbid, the dish is placed on a water bath and heated to 100° C. for a short time, until it is dry, when it is weighed. The weight of the fat, subtracted from that of the total milk solids, gives the amount of milk solids not fat, a very important datum, as it is the most constant quantity in milk analysis, and gives, by a very simple calculation, the extent of watering to which the milk has been subjected.

The determination of casein is usually unnecessary, but may be made to prove that the milk was adulterated with skim instead of water. The portion insoluble in ether is extracted with strong alcohol, then with boiling water, dried up in a water bath, weighed, ignited, the ash weighed and its weight subtracted from the previous weight of casein and ash. The result is crude casein, including, of course, the albumen. The use of skimmed milk is shown by the presence of more casein than the natural quantity, and less butter or fat.

The determination of the total ash is made by simply evaporating 5 c. c. of milk to dryness and igniting over a spirit lamp or Bunsen burner. If less ash is found than usual, chalk or or other mineral adulterant has been employed. —*Journal of Applied Chemistry.*

Corn Husk Frames. — An agricultural exchange has the following: Corn husk frames may be made very prettily and simply by taking pasteboard or thick paper to sew the husks on. Then select your husks; take fine white ones, but not the finest. Take a husk and cut into strips three-quarters of an inch wide and three inches long. Then double it together in a bow as in tape trimming. Put two rows of these around the inside of the frame. Next cut a piece the length of the bows and the width of the husks and bend the two ends together. Now take your needle and slit it very fine through the center, and then sew the two ends that you hold in your hand on the frame overlapping the row of bows; then take some more pieces of slitted work, and turn end go lengthwise of the frame—not crosswise as before. That forms the outer edge of the frame. Take a thin piece of board and make a frame. Place your glass between your paper frame and your board frame, and tack or paste your paper frame down smoothly. You will thus have a nice rustic frame. Beautiful little card baskets and lamp mats may be made in nearly the same manner.

Cleansing Bronze.—A dilute solution of caustic alkalies removes overlying dirt, and allows the green patina to become visible. Where the metal was not originally oxidized the alkali simply cleanses it, and does not promote any formation of green rust.

The incompatability of iron and quinine in wines, on account of their precipitating one another, is shown by a German chemist.

Good Health.

The Transfusion of Blood.

At a meeting of the New York Medical Association, Dr. Frederic D. Lente read a paper on the "Transfusion of Blood." He said transfusion would be more successful if confined to appropriate cases. So far the operation had not been oversuccessful. Yet, notwithstanding this fact, it should not be abandoned; for, it even one case was successful, it should be regarded as a triumph of science. There were circumstances in which nothing short of transfusion would save a patient.

In the discussion which followed, Professor Fordyce Barker said that if transfusion was a resource which could be made helpful, by which a certain number of lives could be saved which would terminate fatally under any other circumstances, it was very important that the medical man should avail himself of it. Since his former researches upon the subject, he had been able to add to the list of recoveries after transfusion, so that the number now amounted to about one hundred and twenty-five authentic cases. Now the question is, as to the effect of transfusion in assisting recovery—whether the cases would have terminated fatally if this measure had not been resorted to? Those who advocate transfusion were not bound to become partisans for it. While the fact is not ignored that there was efficacy in other measures, yet transfusion might add an additional resource to our list of restorative measures—one which might prove successful when no other would.

The fact of failure in seventy-five per cent. of the cases did not militate against the propriety of using the means in the other twenty-five per cent. The question how transfusion was effective in preserving life, he would leave for physiologists to answer.

Dr. J. C. Dalton discussed the question of the real value of transfusion as a curative agent. In the case of an animal, or patient, exhausted by hemorrhage—so far exhausted that the pulse is imperceptible, intelligence very much diminished, and all the symptoms present of impending death—blood had been transfused, and the patient or animal had recovered. The apparent connection of the recovery with the transfusion was so direct, that he was led without question to conclude that transfusion was the cause of saving life. Dr. Dalton did not think it strange that, when patients had lost large quantities of blood, two or three ounces added would be sufficient to save life. There was in the human system from fourteen to eighteen pounds of blood. When one-fourth of the amount had been lost, it seemed almost impossible that life should be saved by the injection of so small a quantity. It did not strike Mr. Dalton in that way. In explanation of his reason, he likened the human system to a machine, in which latter there was a balance-wheel, the object of which was to carry the piston over the "dead point;" otherwise, if there be considerable resistance, the engine would stop. The injection of a very small quantity of blood after hemorrhage might be somewhat analogous to that.

Treatment of Chronic Dysentery by Milk-Diet.—The advantages of a milk-diet in diseases which leave anæmia and general debility in their course, have been often extolled by various authors, more especially by MM. Tocholies and Leclerc. Dr. Clavel, in his turn, in his inaugural dissertation, reports favorably concerning this treatment in chronic dysentery. He had observed this in warm climates, but believes that the same effects may be attained in colder regions. While the milk, by its nutritive properties, effectually combats the anæmia and general debility, it also favors the cicatrization of the intestinal lesions. Asse's milk, which is lighter and contains less butter than cow's milk, agrees better than any other, especially with those patients who also have an hepatic lesion, as in this latter case the bile, which plays so important a part in the emulsion of the fatty matters, is secreted and discharged in less abundance into the intestine. The milk can be administered pure or with the addition of a small quantity of lime-water. Treatment is commenced by giving one pint in 24 hours, which is increased in a few days to two or three pints.—*Revue Therapeutique.*

Respiration.—In our atmosphere the oxygen is diluted with very nearly four times its amount of nitrogen, and all the air-breathing animals, including men, have become adapted to these conditions. If the amount of oxygen became less, a corresponding change would occur in the respiratory system, as is illustrated in the high lands of South America, where, by reason of the rarefied atmosphere, the amount of oxygen inhaled at each respiration is less than near the ocean level; and as a consequence, the human lungs are more developed there, and the inhabitants are remarkable for their largely developed chests, allowing them to make up by quantity for the quality of the inspired air. The reverse is also the case; it has been found that the effect of the compressed air (on those workmen whose constitutions allow them to withstand the pressure and labor for some length of time in the caissons for the foundations of the Mississippi bridge, at St. Louis, Mo., and the East river bridge, New York) was to narrow the volume of the chest, while deep respirations of the highly compressed air were painful.—*Sci. Am.*

Washing the Inside of the Body.

The following ideas of Dr. Jackson are good in a measure, but it should not be forgotten that extreme dosing with water is a decidedly weakening process. The principle is about the same as that involved in the Turkish bath—a little of it goes a great ways:

There is no cavity in the body which water is not fitted for, if you can get it in properly. Why, one of the very best things you can do is to wash your blood; and the great folly we commit in going through our lives from childhood to grave simply is that we do not wash our blood as we ought. Infusions of coffee, tea, chocolate or cocoa, or older or beer do not wash the blood, because with the fluid so taken in, something is taken in also which befouls and defiles the blood. Just let a man say to himself, it is Saturday night, I have worked hard all the week, and Sunday shall be a day of rest to me. I am now going to give my whole system, between this and Monday morning, a good thorough washing. So he begins to drink and drink, and drinks but little at a time; yet between Saturday night and Monday morning a healthy man can drink, without producing any disturbance, a gallon of water. Now, let this come into and go through his circulation, through lungs and skin, and kidneys and bowels, the waste materials are carried out, and when Monday morning comes, if he jumps out of bed and gives his external skin a good washing, the water that he washes in will be foul. Or, if he prefers to test that question even more thoroughly, all he has to do is to take a clean sheet, and wetting it in good, soft, pure water, he wrapped up in it, and lie forty-five or sixty minutes, and then have the sheet washed in a tub of water, and it will color the water so that it will look dirty. The man has been washed inside; his blood has been washed. When you have washed his blood, tissues, bones, nerve, muscle, sinew, membrane and brain, and everything in him, he can defy all pestilence for that week. The washing of a person's inside is as necessary as the washing of a person's outside, and the washing of a person is twice as necessary as the washing of a person's clothes, and yet there are those who are very particular to have their clothes washed with great care who are not at all particular to wash themselves.

Symmetry. — The following proportions are those usually given in works on statuary and painting, and are generally known, but will bear repetition: The whole human figure should be six times the length of the feet. Whether the form be slender or plump, the rule holds good; and deviation from it is a departure from the highest beauty of proportions. The Greeks made all their statues according to this rule. The face, from the highest point of forehead where the hair begins, to the chin is one-tenth of the whole stature. The hand, from the wrist to the little finger is the same. From the top of the chest to the highest part of the forehead is the seventh. If the face, from the roots of the hair to the chin, be divided into three equal parts, the first division determines the place where the eyebrows meet, and the second the place of the nostrils. Right from the feet to the top of the head is the distance from the extremities of the fingers when the arms are extended.

New and Convenient Method of Cauterizing. The eschar produced by nitrate of silver is often too superficial, even though the applications are frequently repeated. Del Greco recommends the use of a small cylinder or pencil of polished zinc. After applying the nitrate of silver the zinc is to be passed several times over the surface already whitened by the caustic. The parts immediately assume a blackened hue, and the cauterizing action is seen to gradually become deeper. The eschar is detached in from 12 to 24 hours. The degree of destruction produced depends upon the thoroughness of the applications and the nature of the tissues to which they are applied.

Life.—We live literally by dying, and perpetually change every atom one by one. Life consists in perishing and renewing, and we are sustained by giving and taking. Every meal is a rescue from death, an instrument by which we stave off the inroads and waste which heat, cold, atmospheric effects and exercise make on our organic life. Dr. Beard puts it thus: The golden decade is from 30 to 40; the silver decade, 40 to 50; the bresen, 20 to 30; the iron, 50 to 60; and from 60 to 70 we learn whether the iron is forged or only cast. According to the doctor's estimate, we are at our best from 38 to 46, when enthusiasm, judgment and experience are balanced. After that date enthusiasm declines, judgment grows timid, and though experience enlarges, there comes a time when it ceases to have any enhancing power.

Swallowing a Tool Chest.—It is reported that in the different prisons of Paris there are five or six deaths every year from the effect of swallowing what is known as an "escape-box." This remarkable box is made for the especial accommodation of prisoners. It is of polished steel, about three inches long, and contains turnscrews, hammers, silk thread and other implements necessary for escape. The box appears to be easily swallowed, but sometimes fails to reappear as intended, and the death of the victim is the result. But when it does pass the bowels, the lucky prisoner is prepared to cut the thickest iron bars and set himself at liberty.

MINING SUMMARY from various counties in California, Utah, Oregon, Colorado and British Columbia, 180-81.

USEFUL INFORMATION.—Value of Iron Waste; M. Werdermann's Process for Resharpening Files; Leaf and Flower Impressions; Cleaning Bottles with Fragments of Iron; Disinfectant and Mouth-Wash; Chloroform vs. Petroleum; Testing Milk; Corn Husk Frames; Cleansing Bronze, 183.

GOOD HEALTH.—The Transfusion of Blood; Treatment of Chronic Dysentery by Milk Diet; Respiration; Washing the Inside of the Body; Symmetry; New and Convenient Method of Cauterizing; Life; Swallowing a Tool Chest, 183.

MISCELLANEOUS.—Manufacturing Machinery at the Mechanics' Fair; Minerals in Monterey; Tempiute Ore; Mining near Placerville; Hydraulicing at La Porte; Mill for Jefferson Canon, 178. Collom's Separating Works; Dry Canon Mines; Cleansing Wool; Bingham Canon; American Steel; Tapped a Pocket; Iron in Utah; Mind and Brain; Coal Areas; Quick Work; Quicksilver Road; The Bonta Mining Company; Golden Iron Works; New Air Chimney; New Engine, 182. Cherry Creek; The McGee's Furnace at Tybo; Raymond & Ely; Sold; Panamint District; Eagle Mill; A Fairy Fountain; Frost Bites; Bullion for August; Arizona Mines; Mining Failures; Painting on Glass, 186. The Floor of the Ocean; Large Set of Sluices; Bismuth; Kalsomining Fluid; Scott's Selenitis Mortar, 187.

THE Ukiah *Dispatch* understands that the quicksilver discovery on Dry creek, being opened by the Henshaws and others, is making a handsome showing. Two hundred tons of rock were taken out by five men in 10 days, and the pile has been estimated to likely yield about $40,000.

THE Belcher yielded $975,663 during the month of August. The Virginia *Chronicle* says that this one mine produces more bullion in six months than the whole of Utah in a year, and more than Colorado in a year and three months.

FINE gold is found in the bars of the Little Salmon river, about 25 miles from Fort Shepherd, where $10 to $15 a day to the hand is being made with a rocker. Quite a number of claims have been taken up.

THE new machinery for the Justice Mining Company, on the Comstock, is being made fast to the solid rock, by means of bolts, holes being drilled in the rock for the purpose. This will make a very solid foundation.

JAMES CRAWFORD has assumed the duties of his position as superintendent of the Carson mint, relieving F. D. Hetrich. Mr. Crawford has made no change in the operative officers of the mint.

ONLY $65,000 more is now required to complete the Santa Cruz narrow-gauge railroad, and arrangements have already been made for obtaining that amount.

THE Belcher air shaft reached the 850-foot level on Monday week. It costs $25,000. It will be continued to the 1,500-foot level.

PLATINA.—It is stated that in the State of Morelos, mining district of Tacala, Mexico, enormous deposits of platina have been found.

THE coinage and bars executed by the Carson mint during August amounted to $297,569.21.

Quicksilver Furnaces.

Since the "quicksilver excitement" began in this State, between one and two years ago, a large number of new claims have been located, as the high price of quicksilver has stimulated prospecting in a great degree. Probably few people are aware how many are interested in this branch of mining in this State, and what proportions it is beginning to assume. Large numbers of the so-called "mines" are mere "prospects," on which so little work has been done that it is difficult to tell whether they will ever be worth anything or not. There are now some 15 or 20 mines in the State which may be properly classed as producing mines, while there are hundreds of others which turn out a few flasks occasionally, some of which will, with a proper expenditure of money, add considerable to the quicksilver product of California.

Although it is with difficulty that capitalists can be induced to invest in cinnabar, a number of mines which have proved their worth are being worked on quite an extensive scale. The names of most of these mines are familiar, but new ones come to the surface almost every day. Some of these well known mines are increasing their works as fast as occasion permits, while others are erecting furnaces and retorts to commence operations.

The foundries of this city have of late received large orders for furnishing furnace retorts, etc., for these mines; and while a considerable quantity of this work has been turned out, orders are increasing rather than diminishing. Calling at the Golden State Foundry (Palmer & Knox) this week, we found them very busy in this class of work. They are making three sizes of furnace. They are at work on a 10-ton furnace for the Albert mine, Colusa county, and another 10-ton one for the Buckeye mine, same county. Another 10-ton furnace has just been completed for the Ida Clayton mine, near Calistoga. They are building a 15-ton furnace for the Annie Belcher mine and another 15-ton one for the Geyser mine. A 10-ton furnace is also being made for the Cloverdale mine. These are all what is known as the "Knox & Osborne Furnace."

They are also making a 20-ton furnace for the Rediugton mine. At this mine they have already two Knox & Osborne and one Almaden furnace, so with this new one they will have four in all. At this foundry they are also making a number of retorts for small mines.

At the Pacific Iron works they are also busy on work for the quicksilver mines. They have had a large amount of work of this class during the past year. They built one very large 30-ton furnace for the Great Western mine this summer, and are now at work on a 20-ton furnace for the Santa Cruz Mining Co., in San Luis Obispo county. They are making a number of retorts for various companies in Lake county, and shipping a good many retorts all over the State.

Some idea may be had from this enumeration of the work being done at only two foundries, of the importance of the quicksilver mining interests. The probability is that instead of decreasing, orders in this line will increase as more mines are opened.

IMPROVED AUGER.—Mr. William E. Howell, of Albany, Linn county, Oregon, exhibited in our office the other day an improved auger invented and recently patented by a Mr. Forstner, of Salem, Oregon. The auger has no gimlet or screw point like the ordinary auger, but is simply provided with two cutting bits. A band encircles the cutting bits and projects slightly beyond them. The lower edge of the band is sharpened so that in boring a hole the band cuts the wood around the hole, working sufficiently in advance of the cutting bits to make a perfectly smooth hole. The bits cut a flat bottom, so that at whatever depth the hole is bored it always has a smooth bottom. The auger bores easily, does not chip or sever the wood in entering or passing out on the opposite side of the stick, and can be withdrawn from the bore by simply drawing it out without backing it out with the usual reverse movement. The invention is one much needed.

GOLDEN STATE FOUNDRY.—At the Golden State foundry, in addition to the quicksilver furnaces mentioned in another column, they are making a lot of hoisting and pumping works for the Justice mine, on the Comstock. These are intended to work the mine to a depth of 1,500 feet. There are three engines—one 24x48; another, 20x42; and another, 16x36. The pumps are 12-inch plunger pumps. The gear-wheel for the machinery weighs 20,000 lbs., and is made in sections for facility of transportation. The whole machinery is very heavy and substantial. At this foundry, as in most others in town, they are very busy; busier, in fact, than they have been for the past nine years.

CEMENT ROCK.—We see by the Napa *Reporter* that a mine of cement rock and water lime has been discovered on the ranch of John T. Smith, situated 2½ miles from Napa, on the Sonoma road. As quite an extensive ledge of this valuable material has been found, and as it can be got to market as cheaply as from the cement mine, at Benicia, a chance for the investment of Napa capital is here presented. The cement is said to be of the best quality.

The Black Hills.

The glowing reports from Custer's expedition to the Black Hills have had the effect of exciting a lot of prospectors who want some new country to work in. Unfortunately for the miners it is forbidden ground, belonging to an Indian reservation. One correspondent writes that the miners traced up a creek, finding colors everywhere. Subsequent investigation proved that there was a belt 30 miles wide, as near as they could determine. A miners' meeting was held and considerable ground located. Contradictory reports, however, are given, and an officer who was with the Black Hills expedition says the newspaper correspondents have given an undue importance to that country, and have represented it as a paradise, when, in fact, its counterpart can be found in many places west of the Missouri river. Scarcely any gold is found, and none in quartz. Old miners charged with looking for gold were not at all enthusiastic. Rumors of rich gold deposits and other minerals are said to be purely rumors. The country is said to be rich in pasturage, is well watered and has fine timber, and would be acceptable for farming; but the country belongs to the Indians, and their rights to it are guaranteed by a treaty with the Government, and the Secretary of War has determined that the Indians shall be protected.

There are accordingly two sides to the story, and which one is true we have no means of judging. However, it is not at all improbable that the country is rich in minerals and will some day be opened up. At present, however, there is little use in miners going to the Black Hills, as the government will prevent it. If the country is as rich and broad as is represented, there will be plenty of room for all the miners who want to emigrate. Several expeditions, however, have organized, and unless troops keep them out it will not be long before some of these parties will be working in the Black Hills. Quite a number of people who have applied to the Department for permission to visit the Black Hills have been refused; but it is hardly probable that a simple refusal will deter excited men. The reports from there now are like the first from the famous diamond fields; it remains to be seen whether a second Clarence King will put a quietus to the Black Hill excitement, as that gentleman did to the diamond scheme.

Mining Accidents.

Mining accidents are of unusual frequency of late, and one can scarcely read through a paper published in the mining districts, without seeing an account of some accident where miners were either killed or injured. Among the latest we notice the following: On last Saturday, J. Cadman, a workman in the Crown Point mine, had his arm broken while attempting to halt the cage. Just as he was in the act of reaching for the bell-wire the cage caught his right arm, producing the fracture.

On the same day Joseph Farnsworth was very severely injured while at work in the bottom of the main shaft of the Sierra Nevada company by the cage being lowered upon him. He was hurt about the head and spine.

On the day previous to the above, while Jerry Cross was engaged in timbering a crosscut on the 1,100-ft. level of the Yellow Jacket mine, a cave occurred, by which he was badly bruised in the abdomen and back, and received some ugly cuts.

W. M. Sims was caved upon and killed a short time since while working in an old shaft near Folsom.

COCHRANE FEEDERS.—Joshua Hendy, manufacturer of Cochrane's ore-feeders, has received an order for eight of this class of feeders for the Lincoln 40-stamp mill, Amador Co., Cal. This order was given after tests made with the Cochrane feeder at the Keystone Consolidated mill, near the Lincoln. Mr. Hendy is our authority for the statement that the Cochrane feeder proved superior to that introduced in the Keystone mill by W. H. Patten.

MR. W. H. GORRIL, President of the Pacific Bridge Co., died in Oakland this week. Mr. Gorril was a lawyer of talent, who came to this coast for his health and has remained here since. He has been quite successful since he arrived here, and has succeeded in building up a very substantial business, and attaining the respect and good will of his patrons and business associates.

COMSTOCK BULLION.—The total product of the Comstock lode, up to the present time, is estimated to be somewhere in the neighborhood of $200,000,000. The *News* says that the amount just named, under the supposition that it is all silver, would, if massed, form a solid bar of bullion 25 feet long, 25 feet wide, and 25 feet high, weighing 1,222,326 pounds, Troy weight.

THE Knoxville quicksilver mines are 36 miles from Woodland, and the people of Yolo, in order to secure the trade of the new mines, are stirring in the matter of building a road between Knoxville and Woodland.

AT the Sacramento railroad shops the manufacture of five additional street cars for the San Francisco company, for which ten were recently made, has been commenced.

A New Quicksilver Strainer.

We examined this week a new quicksilver strainer invented by H. H. Oakes, superintendent of the Mineral Hill mines, Mineral Hill, Elko county, Nevada. It is intended to strain and clean quicksilver after the quicksilver comes from the huckskin or straining bag, and the amalgam is squeezed out. Without going into details, suffice it to say the apparatus is very simple and inexpensive, automatic in operation and apparently very efficient. Mr. Oakes informs us that he has had two at work at the mills for the past two months, and finds that they save considerable quicksilver. He says that in his experiments he found that the ore on the side of the mill where this arrangement was used was worked four per cent. better than on the other side. This he attributes wholly to the fact that the quicksilver was in so much better condition to amalgamate after being properly cleaned and strained by the new apparatus.

The quicksilver is first retorted and then passed through Mr. Oakes' strainer, which is so arranged as to extract any sediment or impure quicksilver in the mass. This is done mechanically. After running the quicksilver through the apparatus for two weeks and cleaning it out, he obtained nine pounds of very good floured quicksilver, of a bluish color. This was dried carefully in the sun, and on being properly manipulated eight pounds of quicksilver were obtained. The remaining pound was a very heavy kind of blue mud, familiar to most mill men. This pound of stuff was analyzed by the State Assayer, and found to contain some silver and 54 per cent. of quicksilver. This floured and dirty quicksilver usually lost is saved by this machine, and is prevented thereby from contaminating the clean quicksilver. The comparative results obtained by practical experiment are very satisfactory, and Mr. Oakes has applied for a patent for the apparatus. The machine is so simple and can be made so cheap that it will be within the reach of any miner, and will do for an arrastra as well as a 60 stamp mill, being an independent appliance.

The American Turbine Wheel.

Since our general reference to water wheels, Messrs. Treadwell & Co. have placed on exhibition, at the Mechanics' Institute in this city, one of the American Turbines, for which they are sole agents on this coast. This is considered a very superior wheel, and has been largely introduced into use throughout the Eastern States, and to some extent on the Pacific coast. Turbine water wheels are rapidly coming into general use, and bid fair soon to almost supersede all other kinds.

The advantages which these wheels possess over the best overshot or breast wheels are numerous and obvious. As a general thing their first cost is much less, and, owing to the small space they occupy, there is little or no excavation required for placing them in position for work, and no heavy nor expensive foundations are needed. Being made entirely of iron, they are not liable to get out of order. The great velocity at which they are run also adds to their efficiency, as there is but little if any necessity for complicated intervening shafts or gearing to obtain higher motion. The number of horse powers that a shaft will transmit largely depends on the velocity at which it runs. One that transmits 50-horse power when running 50 turns a minute, will give about 100-horse power when its speed is increased to 130 revolutions per minute. Much of this advantage is lost when that increased speed has to be obtained by complicated machinery.

It is supposed by many that turbines can be used to advantage only when very high heads are at command; but such is not the case. A much more economical use can be made of a 25-foot head than of one of 60 feet, or more. The friction encountered in passing a stream of water through a long pipe, in even a perpendicular descent, is much greater than is generally supposed, and must all be subtracted from the power as theoretically obtained.

SOGG'S MINE.—In our article on Sogg's mine in our last issue we stated that the company had paid out $60,000 since 1861 for labor and machinery. We should have said that they had paid out this amount since 1871. Latest reports from the mine is that the ledge is improving, and by the time the winter rains come they expect to make much better runs. This mine was incorporated as the Nevada Gold Quartz Mill and Mining Co. on the 25th of July last. John Berry is still superintendent.

A COAL mine has lately been discovered on a tract of land known as the Sobrante, situated on the San Pablo creek, about four miles from San Pablo. The land is in litigation.

A GRAVEL claim, near Eureka, which paid well in the old works, several years ago, is now being re-opened by Chase & Dickerson, with good prospects.

THE Board of Regents of the State University have decided to admit lady students to the medical department.

SAN FRANCISCO capitalists are making arrangements to work the quicksilver discovered on Mount Diablo about eight or nine years ago.

The Pacific Saw Manufactory.

Prominent among the industrial enterprises of this city, and one whose products are tastily arranged for exhibition at the west end of the Pavilion, is that of the "Pacific Saw Manufacturing Company." They exhibit a splendid array of everything belonging to their business, affording a display highly gratifying to our local pride, and indicative of the large success which that company has attained in their difficult and important specialty. They present every description of saws, from the most delicately fashioned scroll saw to the mulay saw of twelve feet in length, and circular saws of all sizes below six feet in diameter. Their collection is roughly estimated at $3,500 in value, and consists entirely of specimens of the ordinary styles manufactured by the company. The letters forming the words "Pacific Saw Company," are composed entirely of saw plates.

This company has now been in operation some eight years, and from small beginnings has gradually opened out to a most important mechanical enterprise.

California, from its first organization as a State, has led off in the use of saws for the manufacture of lumber; and the extraordinary size of her forest productions, has naturally led to the employment of saws of unusually large dimensions to correspond to the necessities of her mammoth growths. As the saws increased in size, the care in their manufacture, necessary to secure a perfect run and rapid feed, has increased in a doubled ratio. To keep pace with this augmented demand both for quantity and quality in this line, this company has procured the most perfect machinery, and the best skilled workmen, to be found in the trade. The raw material is obtained from abroad, and consists of the very best cast steel that can be procured. That used for circular saws is imported in circular disks, corresponding to the sizes needed. The material for all other saws also comes in the rough, unsven, warped, and as unlike the beautifully polished surfaces exhibited as can well be imagined.

The art of truing and tempering these huge circular plates is a most difficult one, and one that can be attained by but very few of even our first-class mechanics. Great care is taken by this company in performing this difficult work to its utmost attainable perfection, and they have succeeded in this specialty to a degree not probably excelled by any other establishment in the world. Saws are made by this company with both fixed and movable teeth. The process of the manufacture of the movable teeth, although carried on at this establishment, is quite a separate business from that of producing the plates, and belongs, we believe, exclusively to Mr. N. W. Spaulding, the inventor of the peculiar kind of tooth which he employs, and a prominent member of the company.

"Spaulding's Patent Movable Saw Teeth," as they are called, have almost revolutionized the business of circular and other large mill saws, and added largely to the capacity and economy of this great primal instrument, in every process and variety of wood work. Mr. Spaulding was the first one to make any important improvement in the manufacture of movable saw teeth, and his invention is that which has made the employment of such teeth a great practical economy over the fixed or square cornered teeth first employed. The invention of the Spaulding tooth has also led, as nearly all important inventions do, to many imitations, all of which present decided advantages in large saws over fixed teeth or the imperfect movable teeth which were first employed.

Smith's Patent Ladders.

At the north end of the Mechanics' Institute Pavilion may be seen six samples of ladders, invented by A. P. Smith, of Sacramento, patented Dec. 30th, 1873. Reference to the illustration will show that the results obtained by the invention are lightness and strength, and consequent safety. These ladders are not more than one-third the weight of the ordinary kinds in use, yet much stronger. The improvements consist mainly in strengthening the side rail by means of wires longitudinally placed and strained tight, and by transverse uniting rods, so that the material used may be greatly reduced in size and made so much lighter that very long ladders can be quite easily handled by two men.

Two kinds are manufactured; one with steps of the same width as the side pieces, the other with the ordinary rounds strengthened by an iron rod running through them and securely tightened by means of nuts. This has the double advantage of making it possible to greatly reduce the size of the rods and of giving great strength. In the engraving A is the ladder, B shows a single step with details of construction, and C shows the manner in which the wire is fastened.

In small towns and country districts where there are no fire engines, the Smith ladder would be of great utility, being easily carried by one man, and, owing to their lightness, without fatigue, one twenty feet long weighing but forty pounds. They are manufactured of all lengths to forty feet. Although so frail-looking they are perfectly rigid under a heavy load, not bending or trembling as do ordinary ladders. The value of these important improvements, secured by the inventor, will be readily appreciated.

Electro-Galvanic Quicksilver Saving Apparatus.

We examined the other day the quicksilver-saving apparatus, invented by Joseph Potts of White Pine, which has just been made in this city. The apparatus was shipped this week to Virginia, where it will be placed in a mill belonging to John P. Jones, and thoroughly tested. It was tried with great success at the Eberhardt and Aurora mill, at White Pine, where Mr. Potts assured us he saved 25 lbs. of quicksilver a day from one-third of the tailings of a 60-stamp mill. He has heretofore taken no steps to introduce his invention, but with the tests to be made on the Comstock he is confident that it will be generally adopted as an adjunct to quartz machinery.

We described and illustrated this machine in the PRESS of June 14th, 1873. The one we examined this week is intended for a 20-stamp mill. The apparatus is placed below the plates or battery, so that the tailings pass over it. It consists simply of a copper box, 12 feet long by four feet wide. Along the upper side of the box are placed a series of riffles or blades, eight in a row and about 4½ by 2½ inches in size. Each riffle is rivetted to the bottom of the box, at an angle of 30° from the horizontal plane, and extends *lengthwise* the box. A space of about one inch is left between the riffles in each row. These riffles are arranged so as to break the current of water and tailings, so that the tailings can not pass down without coming in contact with some part of the amalgamated surface.

On the lower section of the box are rivetted a series of copper riffles across the width of the box. The lower edges of these riffles are perforated so as to allow the quicksilver and soft amalgem to pass through and finally pass into the proper receptacle. The interior of the copper box as well as the upper and lower riffles are all well coated with quicksilver.

This whole copper box is enclosed in a zinc-lined wooden box, which may be closed and kept locked. As the copper reels on the zinc, on the admission of any tailings or water, however slightly acidulated, a galvanic action is set up. In addition to this, Mr. Potts has constructed a powerful battery, with nine large cups. This battery is six feet long and divided by glass partitions to form separate cups. It is coated inside with bees-wax. The zinc plates for the battery are six and a half by eight and a half inches, and one-fourth of an inch thick. This makes both an electric and galvanic battery for the apparatus, favoring amalgamation greatly.

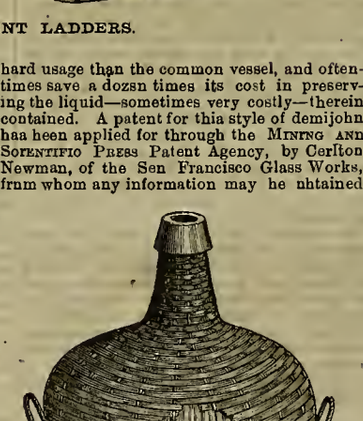
The whole apparatus is enclosed in a large wooden box with a cover, so that it can be kept securely locked. With the small machine nine feet long and sixteen inches wide, at use in the old mill in White Pine, he saved 25 pounds of floured quicksilver per day that was usually lost. There is nothing complicated about the apparatus, nor is it at all expensive. Accurate tests of the machine are to be made at the mill where this one is to be placed, the results of which we shall publish as soon as they are completed.

SMITH'S PATENT LADDERS.

Newman's Improved Elastic Demijohn.

Heretofore much fault has been found by the public with the ordinary demijohn, from their liability of being so easily broken; and as glass has proven to be the best material with which to contain liquids, simply from the fact that it is impervious to moisture and cannot taint the liquid, people will not abandon it for any other article for the same purpose. We give herewith an engraving of a demijohn which will answer all the purposes for which demijohns are used, and which are less liable to breakage than the ordinary kind.

By referring to the engraving it will be seen that the bottle is first covered with the common tule reed—a soft, elastic substance—forming a cushion, if we may so term it, and the rattan is woven over this, thus doubly protecting the bottle. To liquor dealers, grocery men, druggists and others, it will prove invaluable, as it will withstand a greater amount of hard usage than the common vessel, and oftentimes save a dozen times its cost in preserving the liquid—sometimes very costly—therein contained. A patent for this style of demijohn has been applied for through the MINING AND SCIENTIFIC PRESS Patent Agency, by Carlton Newman, of the San Francisco Glass Works, from whom any information may be obtained concerning it, and from whom dealers and others can procure them in such quantities as may be desired.



Newman's Improved Elastic Demijohn.

A LARGE quantity of steel rails has been purchased for use on the Eureka and Palisade Railroad. James Campbell, late of the Central Pacific, has been appointed Assistant General Superintendent.

THE machinery for the new branch mint has been almost completed and placed in position.

A COMPANY is being organized to build a street railroad at Auburn, Placer county.

The Pacific Iron Works.

The Pacific Iron Works is the oldest but one of the iron foundries on this coast. It was established in 1850 by Mr. Goddard, occupying the same location as at present, on First street bet. Mission and Howard. The works occupy a space fronting 240 feet on First street and running back to Fremont street 275 feet. The proprietors for the past twelve years have been Ira P. Rankin and A. P. Brayton. The general superintendent is George W. Fogg.

The works have been completely refitted with new tools of the most approved character, capable of turning out all classes of work, and is one of the largest and best equipped shops on the coast. The shop is a very substantial three-story brick building, perhaps the best in the city. All the different departments of a first-class foundry are here, the pattern-making, machine, foundry and boiler departments being completely equipped. On the average 200 men are employed. These works are peculiarly fitted for turning out heavy work of all descriptions.

In common with the other iron foundries of this city, work has been rather dull with them for the past three years, but the present year is a very busy one. Buildings, mills and hoisting works are on the increase and all of a larger character than heretofore. No particular specialty of work is performed at this foundry except, perhaps, that they have turned out more marine work in the past ten years than the other foundries. They have fitted out a number of tugs, steamboats, etc., which are now running on the bays and rivers of the coast. They built one of the first compound engines ever made here for the steam tug "Fearless," now running in Coos Bay, and which is performing its work well. They are also doing most of the repair work for the Pacific Mail Steamship Company.

These works have just shipped a fifteen-stamp mill for the Oakland Silver Mining Company of Nevada, with pans, settlers, etc., complete. They have a large contract to furnish iron work for the Napa Insane Asylum. Also a contract for furnishing the iron work for the building of the Safe Deposit Company, on the corner of California and Montgomery streets. They have been quite busy building furnaces, retorts, etc., for various quicksilver companies. They built the large thirty-ton furnace for the Great Western quicksilver mine, and are just shipping a twenty-ton furnace to the Santa Cruz Company in San Luis Obispo county.

The Rider Hot Air Engine.

The latest modification of Ericsson's invention for employing hot air in place of steam, has been placed on exhibition in the boiler room of the Mechanics' Pavilion, lately, by Huntington, Hopkins & Co. Several attempts, since the original device of Ericsson's, have been made to render the hot air engine a practical success; but for one reason or another none have as yet succeeded, unless we accord success to this new candidate for public favor, which, having only been patented since 1871, can hardly, as yet, be considered entitled to a reliable record. We understand, however, that this engine has thus far met with much favor wherever it has been introduced, and it certainly appears to be an important step towards meeting the requirements for an economical, safe and reliable engine for light work. It is comparatively noiseless, works very steadily, and is compact and simple in its construction. The one on exhibition, we are assured, can be worked up to two-horse power, with the use of from fifty to sixty pounds of coal for each day of ten or twelve hours, with continuous work, and it requires no more care or skill in attendance than does an ordinary stove. There is no water, steam, nor water nor steam pipes, nor boiler, to care for, consequently there is nothing to explode or endanger, and but little to get out of repair, beyond what is attached to an ordinary office stove; in fact it is much simpler than a kitchen stove with its accompanying furniture. It occupies but a small amount of space—3½x2½ ft. on the floor and 7 ft. in hight. This engine attracts much attention, and all who are curious or interested in examining it can have the opportunity of seeing it in operation every evening.

PHILIP ARNOLD, of Arizona diamond fame, has been released on a writ of *habeas corpus*. It will be remembered that Arnold was arrested in the streets of Louisville, Ky., and placed in duress to await transportation to this city for trial. His friends sued out a writ of *habeas corpus* and attempted to gain his release through the agency of the courts. The court held that the proceedings in the case were regular and legal, and remanded the prisoner to custody. On the 7th instant, and after Arnold had been in arrest some two weeks, the prisoner was brought before Judge Stiles, of the Court of Common Pleas, on a second writ of *habeas corpus*. The judge took the case under advisement and the result was the discharge of the prisoner.

FROM 20,000 to 50,000 pounds of borax have been transported over the Virginia and Truckee railroad since the completion of the new road to Columbus.

Cherry Creek.

The *Eureka Sentinel* has the following to say of Cherry Oreek district: Those who have been loud in thair predictions that Cberry Creek hsd pleyed out, that the new district wss a fizzle and would never amount to anytbing, are now very liable to be mistsken. Last spring the discouraging reports of the district had the effect of driving msny from the place, but those remaiuing, whose faith in tbe mines wes uushaken, are now resping tbe fruits of their faitb; and to-dsy Cberry Creek bas brigbter prospects of becoming an important district thsu ever before. The mines never looked iu a more favorable condition; tbe work of developiug aud prospecting them is being energetically pushed forward, witb tbe most satisfeefory results. The clatter of tbe stamps at the different mills in constsnt operstion, the tons of rich ore being extracted from the various mines and the number of men at work are evidence enough tbat tbe place still livetb. To show the present standing of the leading mines of the district we publish tbe following extraots received from there by mail yesterday, from a gentlemen well versed in mining affairs, and whose report can be relied upon.

The San Jose Company's Mine,

At Egan, five miles from the town of Cherry Creek, has now about eight hundred tons of good ore on the dump, and are still taking out rock of tbe same quality. About forty men are employed at the mine and mill of the compauy. The mill (twenty stamps) was stsrted up on Mondsy lest. Wbile shut down extensive repeirs were made on tbe mill. The compsny is working both custom aud ore from its own mine. General Rosecrans bas the management of the afiairs of tbe compsny.

The Teacup Mine,

Belonging to tbe Geneva company, has a shaft down 150 ft. aud is now running levels. The ore body is extensive and rich. A two-stemp mill bes been running, and 15 days' run of Teacup ore resulted in a bullion product valned at $12,000. The company is now working five stamps of the San José company's mill and has about 30 men employed at the mine. Capt. Kimball is in cherge of tbe mine at present.

The Chance Mine,

Owned by George Treat, of Sen Feancisco, under the superintendeuoy of Frank Hallowell, has 20 meu at work. The ore extracted is similar to that of tbe Teacup mine, and is being orushed at the two-stamp mill belonging to tbe latter company. The body of ore now exposed shows to be large aud of a high grade. The owuer has the utmost confidence that tbe Chance will prove itself to be one of tbe most valnable properties in the district, and from the showing it would appeer tbat sucb confidence has not been misplaced.

The Flagstaff,

Lately bonded to and being worked by McDermott & Co., is showing a fine prospect. At present six men are et work, but tbis force will soon be increased. The character of the ore and extent of the vein indicate that the bonders have made a profitable investment, and if tbe fnture developments disclose es much es those already mede the mine will soon become a payiug institution.

The Star Mine,

Recently sold to Messrs. Dickson, McKenney, and others, and a few days since incorporated as a company iu San Francisco with a capital stock of $3,000,000, is in excelleut condition, and the work of sinking the shaft aud drifting progresses favorably.

The Cherry Creek Company,

Under the charge of Captain Turner as superintendent, is now taking ore from the Exchequer mine and keeps its five-stamp mill iu constant operation, crnsbing seven tons of ore a day. The mines of the oompany are being vigorously prospected, and show satisfactory results.

Other Mines.

Work on the Gray Eagle has been resnmed, with a fine showing. The Victoria, the oldest mine in the district, has been bonded to Captain Turner, of the Cherry Oreek company, and work will be started immediately. The mines at Queen's spriug, Schellburn, Hunter's, Centerville and Ruby Hill distriots, and those on Schell oreek range, are being worked with varying results, some meeting the expectations of tbeir owners, while those not looking so well present an appearance that leads tbe proprietors to think thet they will yet prove productive and yield a good quality of ore.

The population of Cherry Creek is once more increasing, many miuers having lately arrived and obtsiued employment, though, for the present, it would not be well for those seeking employment to go there, as a full complement of men are now at work at the different mines. It was tbe rush thet geve tbe district tbe backset lest year, and to prevent a repetition, it is right to state that for the present labor is not iu suoh demaud as to cause a general immigratiou to the place. When the mines are further developed the workiug force will be increased, hut until then there are enough men in the camp to do the work required. From the present indioations Cherry Creek will, in a short time, ooonpy a prominent position among the mining districts of Eastern Nevada.

Some housewife says that rihbons of any kind should be washed in cold suds end not rinsed.

The McGee's Furnace at Tybo.

A oorrespondent of the Eureka *Sentinel* writes from Tyho as follows: On Monday morning, Aug. 26, as promised by Snperintendent McGee, the Tybo furnace was charged with ore. All the people living in camp assembled at the furnece to witness the first attempt at smelting. At precisely seven o'clock A. M. the first charge of ore was shoveled in; all waited with abated breath to witness results. In the meantime, between the first charge of ore and the first discharge of slag, Superintendent McGee, with his practical knowledge and eagle eye, carefully watched every perceivable part of the entire works—not a thing escaped his notice—up and down, from the top to the bottom of the furnace building, the feed room, tbe ore, coal, fumes, wells, flues, tweers—even to the smoke from the stack; not a curl or color went unnoticed. After the furnace had been charged about one hour, a nice little smile, about the size of an outside gate to a barnyard, was observed creeping over his face, and from this the orowd resd plainly—"a perfect success, gentlemen." And not long had the crowd to wait to prove his superior judgment in ore smelting. Not two hours after the first charge of ore was thrown into the furnace from the feed room, the superintendent took up a ber, tapped the discbarge, the slag started, run like melted tallow and ss clear as crystal. On seeing tbe slsg, bats and cheer after cheer went up from tbe crowd, but no cbange in the superintendent was perceptible. 'Twas all bnsiness and no mistakes with Mac; no basket of cbampague nor drinks in his. Successful legitimate business and no foolishness seem to be his aim. Steadily on until tbis morniug, sleg running freely, and still Mac, without sleeping or eating, is at his post, and at about six o'clock the well, holding between five and six tons of bullion, wes full, and syphon full, and now lead dipping and brick meking in full blast, and it cen now be quite sefely said thst ore smelting in Tybo is a perfect success.

Tbe furnace is of abont 40 tons' capsoity—mecbinery all new, and of a cepacity sufficient to drive two more furnaces of tbe ssme size of the present one. We understand that another furnace is to be constructed soon. Stone is now being dressed for a refining furnace. The intention is, I helieve, to separate the metals and use the lead over. By so doing they will be able to smelt all tbe various characters of ore tbet may be hrougbt to the furnace. Tbe planning of tbe grounds, the furnace, buildings, road, etc., are aooredited to Cyrns Packard, and in the judgment of practical furnece men, is the most economioal, handy and labor-saving construction of the kind in the Stete.

The railroad leading from the main dump of the 2 G mine to tbe furnace is a perfect model end success; is s quarter of a mile iu length, on whicb cars are used, drawn by a horse, that carry 3,000 ponuds, one of wbich is filled, hauled to tbe furnace and unloaded every fifteen minutes. The oar track is above the furnace, and by opening a trap door on the side of the car the ore drops into a chute and slides to tue feed-room floor, where no more handling is required. The mine dump is above this road bed, and holds about 200 tons, at the hottom of whioh is a small iron door that is raised with a lever; through this the car is loaded in one minute. A railroad is connected at the top of this ore bin with the inside works of the mine, through the lower tunnel, and into this tunnel all the ore is emptied through chutes and winzes from above. How tbese works sre exactly arranged inside, and just how the mine looks, I cau't sey. I know that only about ten men are working in the mine, and only know thet the car comes out often well filled with No. 1 ore, but do not know that there are meny thousands of tons of good ore above the railroad tunnel.

The company's mines are under tho management of J. B. Hudson, a thorougb practical miuer, and with suoh men as McGee, Packard and Hudson—all practicel laboring men—(men who are willing to sbake hands with any kid gloved mau tbat offere his heud, "hecause they like to soil gloves")—witb a furnece successfully smelting 40 tons of ore every 24 hours, abundance of good ore to smelt, abundance of wood and coal for their own nse, who cau have a doubt as to the final results?

Raymonn & Ely.—Yesterday we had tbe pleesure of meeting Capt. Day, and had some talk concerning the operations of the company so far as regards the erection of the pumping machinery. The captain seys there is some 160 tons of machinery on tbe way, also the timber for the rods, pillow blocks, etc. At the works preparations ere actively in progress for the reception of tbe machinery. All that care, skill and experience oan dictete in preparing for and setting up the machinery will he brougbt into requisition to insure entire success. The work is being performed by skilled mechenics under able and competent snpervision. It is thought that the machinery will be in motion about the 1st of February next. —*Pioche Record.*

Sold.—The mines bonded by Thomas N. Browne, and situated on Queen Springs hill, near Shellburn, heve been sold recently to Eastern parties, and the money distributed emong the severel owners. One of the fortunate ones, Peter Caffrey, is a resident of Treasure Hill, and we congratulate bim on his good fortune. The property is now under the control of Mr. Browne, and is being worked by bim for the company.—*White Pine News.*

Panamint District.

Tuesday we had the pleesure of meeting and conversing for a short time with Mr. R. C. Jaoobs, one of the discoverers of Panamint miuing district, now gaining a wide reputation for great richness. Mr. Jacobs informed ns thst bis mill would be in running order in abont three weeks. The mill of Jones & Co. will be ready for work this fall. The ore is of a "rebellious" charecter. Panamint is on the very edge of the great Death valley, in Inyo county, aocordiug to the latest surveys about 100 miles from Independeuce, the county seat. There is plenty of water in the district, but not enough for water power; enough fire-wood, but no building material. Lumber is hauled from Tehaichipa aud Los Angeles at great expense. The face of the ooantry is extremely rough snd uninviting. The ronte np the cañon to the central camp is good. The water and climate good. Mr. Jaoobs is going to San Francisco for supplies and will ship by rail to Bakersfield about 30 or 40 tons, as an experiment on rates of freight and time in making the trip. He thinks several days' time osn be saved by this route, which is worth a good deel of money when commencing operations in a new mining district. He is of the opinion that freigbting for Panamint snd all of Inyo county will be done through this route, owing to the saving of time if not a reduction of freight retes. While coming in, he passed quite a number of persons on their way out with teams and packing animals. The estimated population of the district is two hundred, including several families. He does not advise people to go tbere this fall, owing to tbe difficulty of getting building material. Mr. Jaoobs passed one winter in Panamint and says it was not at all severe. The summer seasou is warm, the surrounding country being a hot desert. On the route to Panamint you pass the Slate range borax fields, where the Searle brothers heve a furnace end are msnufacturing a oommercial article of the finest quelity. He says thst the borax fields of Slate range are sufficient to snpply the world for an indefinite time. From all we could learn in our brief oonversation witb Mr. Jacobs we are led to believe Panamint has no equal on tbe coast for richness, and we congratulete our Inyo neighbors on tbeir good fortune in having the district in their territory. We hope our Panamint friends will find it to their interest to do their freighting by the Bakersfield route. —*Southern Californian.*

Eagle Mill.

All the lumber for the new Eagle mill, in Indisn distriot, seys the *Silver State*, is now at Oreana, and is being hanled to the site as rapidly as the big teams of George Miller and Andy Westfall can get it tbere. The msohinery for tbe mill, which is to be of 15-stamp (dry orushing) capacity, will be shipped from San Francisoo this week, and will arrive at Oreana about the middle or last of next week. The miue coutinnes to improve es work progresses, and Superintendent Bivins is in high spirits. The main sheft is down a depth of 70 feet, in a body of ore 12 feet thick, more than one-half of which is first-olass milling ore. Lsst week a test was made of some of the ore taken from the hottom of this sbaft, and it was proved to contain $450 in silver aud $130 in gold to the ton. A contract hes heen let by the oompany to run 240 feet of tuunel from the hottom of the sheft—140 feet north and 100 feet sonth. The tunnel running nortb will connect with an old incline on the ledge, and is being run for the purpose of ventilating as well ae developing the mine; and the sonth tunnel is being run for the purpose of ascertaining, if possible, the extent of tbe imamense body of ore now in sight in the mine. This property, now owned by tbe Oakland gold and silver mining company of California, is tbe one reported against so strongly by George Hearst, the San Francisco mining expert, as to break np the first company orgenized for its purchase and working; and it stands to-day as a mountain of evidence against the mining knowledge of sll such frauds. The mine is one of the most valuable in the State, and the snperintendent, Mr. Bivins, deserves greet credit, considering all he hed to contend egainst, for tbe extraordinary amount of pertinacity he displayed in proving so iich a proverty.

A Fairy Fountain.—The *English Mechanic* gives the following: "If 20 grains of phosp borus, cut very small and mixed with 40 grains of powdered zinc, be put into four drachms of water, and two drechms of couceutrated sulphuric acid be added thereto, bubbles of inflamed phosphoretted hydrogen ges will quickly cover the whole surfece of tbe fluid in succession, forming a real fountein of fire." Those not accustomed to experiment with the phosphorus may need a caution in regard to handling it. It is best to cut it under water.

Frost Bites.—Dissolve 30 grains of tannin in 900 c. c. of water, and 3 grams of iodine in 50 grams of alcohol. Tbe solutione are mixed, end the mixture diluted to 1¼ liters. The mixture is placed upon a slow fire, and the affected pert immersed nntil the liquid becomes too hot; tbe part is then allowed to draw near the fire. The application is made once daily, a cure being effected after four or five days.

Bullion for August.—Wells, Fargo & Co. shipped from Anstin during the month ending August 31, 1874, per acconnt of Manhattau S. M. Co., hullion as follows: Eighty-five hers, weighing 8,629 pounds, valued at $110,202.77.

Arizona Mines.

The *Arizona Miner* has the following about local miniug operations: C. O. Brown got in from Oro Blsnco on Mondey and brought several nice lumps of gold teken out of the mine. He hss now got mining under way in a pretty sstisfactory menner. The mine is being worked day and night and seven arrastras are in continuous operation. The vein hss widened from twenty inches to four and one-half feet, witb perfect walls and every indication of permenency. He ssys if the vein continues just as large and rich as it shows at present, he doesn't ask for a better opportunity to get ell the money he wants. He hss bonght a lot more supplies and started them to the mine.

He says the plsee is rapidly assuming the character of a full-fledged mining camp. About forty people are at work there. A ranch is tbere with snpplies of milk, hutter and beef. The people are confident and of course cheerful.

Three arrastres are running on ore from the Ward mine, and one on ore from the Ostrich—this last being about six miles from the Oro Blanco and Ward. It is a recent discovery by George Hogg and another man, and Mr. Brown says the prospects for a splendid paying miue are all that could he desired. Five men are at work on it.

The mountsins are full of prospectors, and none have any doubts about that region, for many miles in extent, being very rich in gold, nor that it will by and by be the scene of a vast number of prosperous people.

J. McElliott snd G. W. Hamor have been at work for severel weeks developiug a couple of quartz ledges nesr John T. Smitb's ranch. Tbey sre now in town and report fine prospects for two good mines, and they intend to continue development.

E. M. Pearce and Mr. Barnes have gone to the Young America with snpplies. This miue is one of the richest in copper and silver in tbis or any other Territory. Our dispatches from Maricopa Wells sbow tbst Mr. Shultes, of Phenix, hss returned to develop the Quajate, in the vicinity of the Young Americe.

Colonel Taylor got in from the mines on Thursdsy aud also Mr. Sbultes—mentioned in our Maricopa dispatch. Colonel Taylor has purchased conditionally 700 feet of the marvelously rich Quajate, claimed by Mr. Sbultes, 600 feet of Olark and Collins on a vein which is simply an extension of the Quajate, Sacaton and Grey Eagle nnited, and also the undivided helf (he now owning one-helf) in 1,500 feet on tbe Sacaton and Gray Eagle from P. Forbach. Both Colonel Taylor and Mr. Sbultes showed ns specimens of ore from the dump of the Quajete, which ere extraordinarily rioh in horn silver, hlack sulphnrets and native silver. Mr. Sbultes bas 14 tons of ore which, with suitable reduction works at hand, he considers would be worth $20,000 in gold. Next week we shall get at sll the importent facts oonneoted with the discovery of these several veins and present them to our readers.

Colonel Boyle, superintendent of the Sonora compauy of London, is due here by stage of Tuesday morning. We understand he oomes prepared to prosecute work on the Santa Rita mine on a large scale.

Mining Failures.

In an article in the Fairplay *Sentinel* (Col.) occurs the following paragrapb: Every miuing district in the Territory has at a great expense erected monuments to Dame Folly that the names of the progenitors of smelting and reduction works, etc., might he handed down to posterity in "blue and gold." From Jamestown, the most northern mining district in Ooloredo, to the San Juen, the extreme southern, these monuments abound on every hill side, in every gulch; in short millions have been squandered in the vain endeavor to find some new metbod whereby the metals of Colorado might be extracted in a way peculiarly Americau in its application. If a history of different "processes" for smelting ores were written the historian would find that Gilpiu county has been the main bettle grouud. He also would find if he followed the rsmifications of the "proces man" for 10 years, that bnt one company have succeeded in the successful and remunerative milling of ores in the golden county of Gilpin. After Gilpin comes Park county, tbe same company having introduced their works, here, and in the treatment of ores as regerds smelting Summit, one of the newest countics of Colorado, comes the third on the list. Of this latter county we have to deal aside from the comparatively old mining district of Montezuma there has been but little done in the way of developing lodes, and these developments in a majority of cases heve been so meeger, that no determinatiou could be arrived at as to the value of the mines.

Painting on Glass.—The best metbod of peinting upon glass, so that the coloring will resist the weather, is given as follows: First draw tbe snbject on paper, and festen it, face downward, by pastiug it at tbe ends, to the gless. Turn the glass over, and paiut with a camel's heir pencil, tbe pigments being mixed with varnish. Let the outlines dry before filling in end sheding. The painting may be varnished over.

By placing fresh olive flowers at once in boiling water and collecting tbe distillate immedietely, the product is superior to that obtained by immersing the flowers in cold water and then reising the temperature.

The Floor of the Ocean.

The voyage of the "Challengar" promises to accomplish even more than was at first anticipated in throwing light upon certain disputed questions in regard to the physics and natural history of the globe. The subject of ocean circulation is now becoming comprehensible, and some of the most important geological problems seem to be receiving their solution. One of these is adverted to by Mr. Alexander S. Wilson, in a paper published in *The Chemical News* upon some of the chemical aspects of physical geography, based upon one of Professor Thompson's letters from the "Challenger," referring to the fact that in sailing from Teneriffe to St. Thomas the sounding indicated that the bottom of the Atlantic rises into a ridge about 300 miles west from Teneriffe, and that from this where the depth was 1,500 fathoms, the bottom sloped gently down, until at 750 miles west of Teneriffe it sunk to a depth of 2,950 fathoms, this continuing constant until within 300 miles of Sombrero.

A remarkable relationship was found to exist between the depth and the character of the dredgings. At 1,500 fathoms the dredge brought up globigerina ooze, multitudes of minute shells, and fragments of coral, the whole composed mainly of carbonate of lime. As the depth increased the proportion of these shells diminished, until in the deep water they disappeared, and there was nothing brought up but the fine red mud which did not effervesce with acids. This, consisting of iron and alumina, was met with everywhere over the plain, and could not be, therefore, as at one time supposed, the mud brought out by great currents, such as those of the Amazon and Orinoco; but must have been produced on the spot.

A specially noteworthy circumstance was the absence of shells, found elsewhere in so great numbers. In explanation of this phenomenon, Mr. Wilson refers to the concurrent fact that the water from these great depths is very rich in carbonic acid, the air from a depth of 1,476 fathoms containing 40 per cent. of carbonic acid, the percentage probably increasing rapidly with the descent. Water thus saturated with carbonic acid will readily dissolve carbonate of lime; and Prof. Thomson therefore concludes that the uniform deposit of red clay is simply the insoluble parts of myriads of shells, the residue, in fact, of a chalk formation now dissolved. The animals living on this area are universally destitute of a shell covering, this either being siliceous or membraneous. Thus, while the shallower regions of the deep sea-bed are covered by a layer of grayish-white ooze, prolific in organisms, whose shell will one day form chalk, this in the deep submarine is dissolved, leaving behind only the red mud. A geological formation would consequently consist of chalk or limestone of some sort at the higher levels, gradually losing its calcareous character as it passes lower down, first into a calc-ferrous slate, and finally into a slate containing no lime whatever. *New York Tribune.*

We learn from the Philadelphia *Ledger* that seven years of patient study have resulted in the invention of a series of machines by which American lead pencils are made, in Jersey City, entirely by machinery. From the time the plumbago and rough strips of cedar and other woods enter the machinery, until they are turned out together polished lead pencils, ready to be tied up in packages, no hand labor is required. The materials used are all American, the plumbago coming from Ticonderoga county, New York, and the cedar from Florida. The pencils are made of five different grades, and they are said to be of such quality that they can compete at once with the best pencils of —German manufacture.

Large Set of Sluices.—There was completed yesterday, at the Woodworth mill, near the mouth of Gold Cañon, a set of blanket sluices 1,700 feet in length. The string is made up of twelve compartments or separate sluices, each 19 inches in width. The bottom of each compartment is covered with blankets for catching sulphurets. It is estimated that the whole string of sluices will catch about 40 tons per day of concentrated tailings. All the water and tailings passing down Gold Cañon will run through the sluices.—*Enterprise.*

The Flora of the Wasatch range is unsurpassed in the world. Recently some miners in prospecting in the peaks beyond Parley's Cañon, having an eye for the beautiful of nature, thought to count the different varieties of flowers which wasted their fragrance on the mountain air, and bloomed and blossomed unseen. With a line they drew a circle, and in a radius of 40 feet they counted 63 varieties. The Gentiles have made the mountains of Utah yield up their precious metals and blossom as the rose 63 times.—*Salt Lake Tribune.*

"White coal," is the latest Australian discovery. It consists of felted cabbage fibers, like peat, which contain interspersed between them fine grains of sand. It is easily combustible, and burns with a bright flame. The white coal covers large tracts, requiring no mining.

In order that some idea may be formed as to the enormous extent of land required to grow trees for building and other purposes, in Europe alone, it may be stated that no less than 500,000,000 of acres are at this moment estimated to be in cultivation as woodlands, which is a very large percentage of the whole area.

Bismuth.

This metal occurs in its native state, and also in combination with sulphur, oxygen, silica and tellurium. The bismuth of commerce is almost exclusively obtained from the native metal, which is chiefly procured from the mines in Schneeburg, Saxony.

Commercial bismuth is never absolutely pure, but as the other metals with which it is associated are commonly more oxidizable than itself, it may, in a great degree, be separated from them by fusing the powdered alloy in an earthen crucible, with one-tenth part of its weight of nitrate of potash. When this mixture is heated until the nitrate is completely decomposed, a portion of the bismuth, together with the greater part of the impurities, will have been oxidized and remain in combination with the potash, while a button of purified bismuth collects in the bottom of the crucible.

Bismuth enters into the composition of the best type metal, and has the property of imparting to it a clean, sharp face. In the solder employed in the manufacture of pewter wares it also forms an ingredient, the composition being one part of bismuth, five of lead and three of tin. Bismuth forms one of the ingredients of a fusible metal, from which, such as toys, spoons are made which melt on being put into a hot cup of tea or water. An alloy composed of two parts tin, three lead and five bismuth, melts at a temperature of 199° Fahrenheit. Another alloy has been used in some parts of the continent of Europe in making safety plugs for steam boilers, which, by melting at a certain temperature, are intended to prevent their explosion. A subnitrate of bismuth is used as a cosmetic. Pearl powder is a similar preparation, obtained by dissolving bismuth in aqua regia, and precipitating by water. Bismuth is employed in the manufacture of porcelain, as an agent for fixing the gilding and for increasing the fusibility of fluxes, and neutralizing the colors which are often communicated by them. It is also used to some extent in medicine —*Ex.*

Kalsomining Fluid.—Take of white glue, 1 pound; white zinc, 10 pounds; Paris white, 5 pounds; water sufficient. Soak the glue over night in three quarts of water, then add as much water again, and heat on a water bath till the glue is dissolved. In another pail put the two powders and pour on hot water, stirring all the time, until the liquid appears like thick milk. Mingle the liquids together, stir thoroughly, and apply to the wall with a whitewash brush.

Manufacturers who use the best skilled labor, pay the best prices and produce only first-class work, are most generally successful. It is just as sensible to expect a poorly paid workman to do a large amount of work, and do it well, as it would be to expect a half starved horse to perform as much labor as one that is well kept.

In England, waste scrap-iron, turnings, and wire-clippings are put around the foot of telegraph poles when they are placed in the holes dug for them; and in gravelly soil the oxidation of the iron causes a conglomeration of the gravel into a dense, hard mass that adds much to the rigidity of the foundation.

Scott's Selenitis Mortar.—By a number of experiments it is proved that lime becomes hydraulic by absorbing small quantities of dissolved gypsum; that only such lime will set with gypsum as slakes slowly and whose density is greater than that of common lime.

In preparing cork for industrial purposes, the slabs are made to undergo a steaming process. The dividing of this peculiar substance requires the employment of specially adapted machinery.

The Pacific Rural Press

Is a Large and Handsomely Illustrated Agricultural Home Journal; Original, Instructive and Attractive; its varied contents, ably written and condensed, render it popular with its readers. We endeavor to make it a credit to the field it occupies, and to every intelligent circle it enters. Entirely free from politics, its columns are filled with cheerful words of encouragement for our Pacific Industries and instruction for the people. It extends information of the growing wants and necessities of our rapidly increasing and progressing agriculture. You can read it with pleasure, for present and future profit; you can send it with satisfaction to your friends anywhere. Its editorials are earnest and its contents reliable. No questionable advertisements darken its pages. It is a journal for rural homes throughout the Coast. It is a handsome home print, without a rival on this half of the Continent. Subscription, in advance, $4 a year.

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

Ayer's Hair Vigor, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the Vigor is praised for its grateful and agreeable perfume, and valued for the soft luster and richness of tone it imparts.

MECHANICS' FAIR

DAILY.

Having been awarded the publication of the Daily Newspaper in the Pavilion during the Fair of the Mechanics' Institute of the City of San Francisco, commencing August 18th, 1874, we would respectfully announce that no efforts will be spared to issue a

LIVE AND DESIRABLE SHEET.

Its immense circle of readers will include all adult visitors at the Fair, embracing during the exhibition a large proportion of the most intelligent, energetic and influential citizens throughout the Coast.

Advertisers will secure the best terms and space by handing in their orders early.

DEWEY & CO., Publishers.

SHEET IRON PIPE.

THE

Risdon Iron and Locomotive Works

Corner Howard and Beals Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

☞ All kinds of Machinery made and repaired.

24v22-3m JOSEPH MOORE, Superintendent.

[Continued from Page 181.]

in the bottom working much softer than for some time past.

SUTRO TUNNEL.—The header is now in 6,797 ft. Progress last week, 75 ft. in dry ground, there being no water coming in. The number of men working in the header at present is 130. 12 mules and 32 cars, carrying 2½ tons each, are employed in the removal of the rock. About 100 car-loads, or 250 tons of rock are discharged at the month of the tunnel per day. At the present rate of progress Superintendent Benjamin expects to reach shaft No. 2 in five or six months.

CALEDONIA.—The main shaft is down to the 1,000-ft. level, at which point a station is being opened for the purpose of opening a new level. Everything in and about the mine is in fine fine working condition.

YELLOW JACKET.—The main east drift from the incline, on the 1,740-ft. level, is in 161 ft., the face in hard blasting ground. The south winze is down 278 ft. below the 1,540-ft. level, and has a considerable flow of water at the bottom, somewhat impeding the progress of the work.

BELCHER.—Daily yield, 550 tons of ore. The ore breasts on the 1,000, 1,200 and 1,300-ft. levels are looking well and yielding finely. The new air shaft has made connection with the upraise from the levels below, and already the beneficial effects are being felt throughout the upper portion of the mine. The machinery is all in fine condition, and the mine promises a rich yield of ores for many months yet to come.

BALTIMORE CONSOLIDATED. — Sinking the main shaft is making the usual good progress.

IMPERIAL EMPIRE.—Driving the main east drift, on the 2,000-ft. level, is making excellent headway. Sinking the main incline is making slow progress. The south winze, from the 1,850-ft. level, is still continued downward, at a fair rate of speed, the bottom still in fine ore. No change to report of prospecting operations in other portions of the mine.

BUCKEYE.—The ore body recently developed in the north drift at the first station still continues of a good character. The raise on this ore is up 30 feet and shows no change in the character of the ore. The company have about 200 tons of ore on the dumps and piled away in the mine ready to hoist to the surface. The Hope mill is kept steadily running on ore from the mine.

NEW YORK.—The main shaft is now down 35 ft. below the 560-ft. station.

SILVER HILL.—A breakage of some of the pumping machinery three or four days since has necessitated the suspension of almost the entire prospecting operations on the lower levels.

JUSTICE.—The preparation for the erection of the new and powerful hoisting and pumping machinery is making steady and favorable progress. Sinking the Waller shaft is making good progress, following the ore vein and developing some fine ore.

LEO.—The face of the north drift continues looking well and yielding some very good ore. In the stope the vein is fully four feet in thickness, and the bulk of it is good milling ore.

TYLER.—There is still no cessation of the flow of water into the shaft, and it seems hardly probable that it can now be overcome until the introduction of heavier pumping machinery.

PICTOU.—The main tunnel is still being driven ahead toward the ledge. Stringers of quartz continue to be met with.

BULLION.—Driving the north drift on the 1,700-ft. level, from the Imperial shaft, is making good headway, the face in soft working ground.

UNION CONSOLIDATED.—The east cross-cut from the main north drift on the 1,300-ft. level of the Ophir shaft is showing some very fine looking quartz.

GENESSEE No. 2.—New shaft down 87 ft. Streaks of quartz and porphyry are coming in at the west side.

SUCCOR.—Sinking the new shaft is again making fine progress.

MINT.—Sinking the main shaft is still progressing finely, the rock in the bottom working quite soft.

Arizona.

WALNUT GROVE.—*Miner*, Sept. 4: The latest news from the Vesuvius mine, in Walnut Grove district, was related to me, a few days ago, by Mr. Thatcher, who was at the mine last week, and assisted the owners in cleaning up. They ground seven tons and got $700, just $100 per ton. The condition of the mine is good. The owners are now down upon it over 40 feet; have drifted "both ways" from the bottom of their shaft and have a "pay-streak" of from 12 to 18 inches thick, which, if properly worked, will pay $150 per ton, in free gold.

FREDERICK has now about 140 tons of ore, that will pay about $50 per ton, ready for crushing. Explorations in his mine have developed a very large vein of rich rock.

THE Tiger dump has has 700 or 800 tons of the richest silver ore, all of which, and more too, was quarried out of one shallow shaft.

BRADSHAW.—Messrs. Goodwin & McKinnon, owners of a claim on the War Eagle lode, have, for about a year, run two arrastras by horse-power and done remarkably well. They have, so far, this year, worked 16 tons of ore which ore has yielded about $1,552 in gold. Their last run, eight tons, paid at the rate of $98.75 per ton.

British Columbia.

CARIBOO DISTRICT.

MINING ITEMS.—*Sentinel*, Aug. 29: The Chinese hydraulic companies above Richfield are cleaning up well, three companies—the Bradley Nicholson, Jenny Lind and Well Mary Ann — taking out from 80 to 100 oz. weekly. At Conklin Gulch the White Pine Co. running across the channel and getting a little gold. Ferguson Co. had 105 oz. last week; up to Friday this week 100 oz., only working one shift. The Ontario Co. have been prospecting their deep ground this week, and the supposition is that it is merely a pot-hole; are now running for the western side of the channel, where they expect to get good pay. Cora Co. have been building a shaft-house this week, and fixing up generally. Ottawa Co. have stopped prospecting for the present. Water heavy. At Jack of Clubs the Spruce Co. washed up 68 oz. last week, and 43 oz. up to Thursday. The Point Co. have got to work again in the face; have not washed up so far. The Van Winkle Co. had 220 oz. last week, and 60 oz. on Wednesday. The Vancouver Co. washed up 80 oz. last week; have not washed up so far this week; they are working on the sides, being unable to work in the face it is so wet. The Vulcan Co. are digging a chamber for a dump; expects to start in the face on Monday; opened out a set in the beginning of the week and got 4 oz. At Burns creek Perkins has struck a rich piece of ground and took out $80 in a short time. The company on Peters' creek are busy building a flume and making timbers.

Colorado.

CHALK CREEK.— Colorado Springs *Gazette*, Sept. 5: The Chalk Creek mining country, which is just now being opened up, promises to be a fine field of unusual richness. The whole of the region seems to be exceedingly rich in silver. Thus far about 300 lodes have been located. Few of these have yet been tested; but such assays as have been made give promise of unusual yields. One mine is down 90 ft. and has a crevice of from 2 to 4 ft. in width; the ore from it assays $800 to the ton. A quantity of surface ore which has been assayed runs from $75 to $125 to the ton. If these assays are fairly indicative of the character of the lodes, the Chalk Creek mining country may be set down as one of the very richest sections in Colorado.

Idaho.

MAHOGANY.—*Avalanche*, Sept. 12: This mine continues to pile up ore at the Ellmore mill, hauling at the rate of 12 to 15 tons of high grade ore daily, which can be increased when needed to 25 tons per day.

EMPIRE.—Sinking for the 6th level will be commenced at the Empire, as soon as the new wire rope arrives, which is expected daily. The bottom of the mine is looking well, and in the 5th level south of shaft they have fine ore and a large ledge.

SILVER CORD.—This mine is looking well throughout the lower levels. The winze between the 3d and 4th levels is down over 60 ft. and shows a large ledge of very rich ore.

POORMAN.—Putting up the new machinery, sinking the main shaft, driving two drifts, and work of all kinds is going on rapidly.

IDA ELLMORE.—The main shaft is now down 120 ft. below the 11th and cutting out for the 12th station has been started.

Montana.

PHILIPSBURG.—*New Northwest*, Sept. 5: Mr. Tilden, manager for the Hope company, has gotten his property well in hand, and is working some 15 men in the leads raising ore, has the St. Louis mill to reduce with and the machinery ready to ship which will greatly increase its capacity and efficient reduction whenever he shall decide the circumstances justify it. That will be a sufficient pile of the ores on the dump which he is now taking out steadily.

THE Northwest company has a contract to reduce a large amount of ore, and aside from this are prepared to ship such ores as they may deem advisable. The quality of the ore is high and if the vein continues good as they go down, it is a splendid property.

Oregon.

GRANT COUNTY.— *Mountaineer*, Sept. 12: A gentleman just down from Grant county informs us that there is much talk up there now concerning the quartz mines, some good paying ledges having recently been discovered. Were the money forthcoming to set up mills, several companies would be crushing ore, which it is thought will pay well. The Elk Creek district is now most promising.

VIRTUE MINE.—*Democrat*, Sept. 9: We are informed that Mr. Hyde, superintendent, has instructions from headquarters to put up 10 more stamps in the Virtue mill, which will be done within the next 30 days. This will make the mill a 20-stamp mill, which will be run by the same power now used in running the 10 stamps.

CHERRY CREEK DISTRICT.

THE MINES.—*News*, Sept. 12: The Cherry Creek company are working a large force on the Exchequer mine, and Capt. Turner is confident of having the biggest property in the State. The ore as extracted is being conveyed to the 5-stamp mill of the company, and the pile there accumulated has began to assume considerable proportions. The Chance is still "keeping up its lick," and the little 2-stamp mill continues to crush an astonishing amount of ore. The yield from this one institution is $900 per day. The Star mine is becoming a giant among the mining locations of the district. Wonderful results have been obtained from the ores worked, and as depth is attained, the extent and value of the same is increasing. The Tea-cup and Geneva company still holds to its well-merited reputation as an extensive and valuable property, and is being systematically and energetically worked.

Utah.

COLUMBIA DISTRICT.

MINES.—Cor. S. L. *Tribune*, Sept. 9: The Champion, Idaho, Buckskin, Blanche D., Isabelle D., Chanticleer, Washington, Chimney Corner, Athatasca, Seneca and Miami, for the amount of work done on them, show unusually well — the Idaho, Blanche D., Chanticleer and Chimney Corner, surprisingly so. The Great Western, situated on the western side of the range, owned by Kilvington & Co., shows a large amount of very fine croppings, which yielded $22 in silver and $30 in lead. In fact, all show merit which would richly reward capital in their further development, and my prediction is, that within one year Columbia will be known as one of the greatest mining district in Utah

Large or Small Water Wheels.

EDITORS PRESS:—In your valuable paper of August 15th appeared an interesting item about hurdy-gurdy water wheels, illustrating the advantage of a large diameter hurdy water wheel over a smaller one, in respect to the gain of power with a given quantity of water and fall. But in your issue of August 24th appeare another statement signed "Experience," which intimates to your readers that the size of the wheel was not material, that the disparity of the results of the small and large wheel on trial is attributable to the method of gearing.

I do not recommend the hurdy wheel as giving a high percentage of power from water, nor would I state anything to lessen any merits which may pertain to the Leffel & Myers' double turbine water wheel, under high falls; but I think, taking proper exception to the statement of "Experience," that the disparity of results is not to be attributed to the method of gearing. I contend that the result obtained came from the diameter of the wheel, and to show this it will not be superfluous to state that the water imparted the same velocity to the circumference of both wheels, empty; that the number of revolutions in the larger wheel was consequently about half; that the power of the water issuing from the nozzle and striking the face of the water-wheel, its buckets or cups was the same on both wheels, as the fall and amount of water were the same.

Now, if the power of the water is applied to the circumference of the wheel, it acts the same as in a whim or horse power, where the horse drags on a beam or tongue, and this power is continuous; if it is capable of overcoming the resistance or weight hanging to it, be it in the shape of stamps to be lifted or a tub full of quartz from a deep shaft. And now anybody may know that a horse is able to lift a heavier load the further and longer the distance from drum to attachment on the beam or tongue; consequently more power.

The drum represents the cams lifting the stamps; the diameter of the hurdy-gurdy water wheel is represented by the beam or tongue of the miner's whim, and the face of the wheel by the attachment for the horse.

CORRESPONDENT.

[NOTE.—What the horse gains in his ability to lift "a heavier load the farther and longer the distance from the drum attachment," he looses by the longer time required to lift it through the same space, by the same amount of exertion; consequently no power can be gained by increasing the diameter of the wheel.—EDS. PRESS.]

COMPLETED.—The new air chimney at the Consolidated Virginia mine is completed and works to a charm. All the hot steam coming from the mine at the mouth of the shaft before it was built, now passes through it.

JUNN & CROSBY'S new mill, Clear Creek county, Colorado, is a success, and the machinery is running night and day.

ORE is being shipped from the Comstock mines to the mills on Carson river and Silver City, at the rate of 1,465,000 lbs. per day.

THE last clean-up of the New York Hill mine, Nevada Co., was $3,220, or $5,650 to the load of rock.

THOMAS MORRIS, of Jeffersonville, contemplates opening the Boston claim in Table mountain, this winter, with hydraulic.

RICH placer mines were discovered last Friday at the head of the Cartac water-ditch, Los Angeles county.

CHARLES DELANEY President of the Virginia City Miners' Union, who shot himself last week, died on Wednesday morning.

THE Pelican mill, Clear Creek county, Colorado, is being enlarged.

A GANG of Chinamen were set to work in the coal mines near Tenino, on Monday.

DREDGING has been commenced on the bar at Wilmington, the port for Los Angeles.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Sept. 15th, 1874.

FOR WEEK ENDING SEPT. 1ST, 1874.

JOINT HOLDER.—Charles Buckner, Jr., S. F., Cal.

HORSE POWER.—John D. Harner, S. F., Cal., and Corydon A. Fargo, Stockton, Cal.

GAS HEATER FOR COOKING OYSTERS.—A. W. Manning, S. F., Cal.

FLOAT FOR STEAM BOILER SAFETY GAUGES.—Andrew Moon, S. F., Cal.

WATER-SUPPLY REGULATOR —David Morris and Theodore Morris, S. F., Cal.

ORE-WASHING MACHINE.—Charles P. Robbins, S. F., Cal.

CLOD CRUSHER.—William P. Anderson, Albany, Oregon.

HYDRAULIC CEMENT.—Frank E. Brown and Wilfred L. Brown, Mare Island, Cal.

FIREMAN'S LANNER. —Heyman Fox, S. F., Cal.

BALING PRESS.—C. P. Littlepage, Thomas J. Uhlhard and William A. Greenly, Big Pine, Cal.

COMPOSITION FUEL.—James A. Mare and Wm. Irelan, S. F., Cal.

CONSTRUCTION OF SEWERS.—James M. Thompson, S. F., Cal.

N. B.—Our list published in our issue of Sept. 12th should have been dated Aug. 25th.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Mining and Scientific Press,

(Established in 1860.)

The oldest, largest and best Mining Journal. Devoted, also, to Science, Invention, Mechanic Arts and Industry on the Pacific Coast.

Subscription to the above, $4 a year; Sample Copies, post paid, 10 cts.— four for 25 cts. Address,

DEWEY & CO., Publishers,
No. 224 Sansome st., S. F.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. MCCARTY—General Agent.
W. H. RATTENBERRY—California.
CHAS. W. OTIS—Contra Costa County.
CHAS. T. BELL—Alameda, Santa Clara and Santa Cruz Countiee.
J. W. ANDERSON—Orange and Santa Ana, in Los Angeles County, Cal.
HOOD ALSTON—San Luis Chispo, San Bernardino and San Diego Counties.
JAS. KEARNEY—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. GOODWIN—Sacramento County.
S. G. CRAWFORD—Nevada, Sierra and Plumas Counties.
J. G. KELLEY—For Washington Territory.

Special to Inventors.

All inventors who secure valuable patents through the M. & S. PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the M. & S. PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes, for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are favorable to Pacific Coast inventors as compared with those of any other Agency in the United States—aside from the benefit derived from having inventions set forth truthfully at an important time in appropriate and influential journals.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

GENERAL MERCHANDISE.

WEDNESDAY M., Sept. 16, 1874.

Rags and Bagging are unchanged in price and still low. The present dull state in this line is entirely unexpected; but it is no doubt due, in great part, to the disposition of holders of Grain not to part with their produce, which of course directly affects the Bag business, as Bags are not necessarily used till shipment. Coffees are weaker, Coal is unchanged in price. Fish are quiet. Oils are steady. Sugar remains firm. Tobacco is buoyant.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., MINING AND SCIENTIFIC PRESS office, S. F. Bound in cloth. Price (very low), post paid, $1, coin, or its equivalent in currency. Inventors, Engineers, Students, an Apprentices will find it exceedingly useful an especially handy for reference.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

PURCHASERS please say advertised in Scientific Press.

Fourth Year of the Pacific Rural Press.

The publishers of this journal design making its weekly issues during its fourth year (1874) still more acceptable and valuable than those of the past.

A Farmer's Paper Always.

The RURAL PRESS—established Jan. 1870, has been thoroughly a farmer's paper—" first, last, and always." Its success in popularity and rapidly increasing circulation has exceeded that of any other weekly on the coast

Neither Politics or Creeds.

We refer with satisfaction to the independent, chaste and useful character of our reading matter and the absence from our columns of questionable and demoralizing advertisements.

We shall strive to make it an ever welcome visitor to those who desire to constantly

Improve the Heart and Mind,

And shall give a larger space to our HOME CIRCLE department, which from the first has been a popular feature of the RURAL.

Our aim is to gather information from all reliable sources, in the varied forms in which it is to be obtained. Our work is to divest our gleanings of all superfluities; condense such information as is of most importance to our special class of readers—give it to these in the plainest and fewest words possible,—saving *their time by our labor.*

Our Leading Departments

Will be continued under the following heads:

The Home Circle,	The Horse,
Young Folk's Column,	The Swine Yard,
Short Stories,	The Vagatable Garden,
Home and Farm,	The Flower Garden,
Useful Information,	The Vineynrd,
Domestic Economy,	The Orchard,
Good Health,	Tropical Fruits,
The Dairy,	Small Fruits,
The Apiary,	The Cereals,
Poultry Notes,	Pasturage, etc.,
Horned Stock,	Fertilizers,
Sheep and Wool,	Miscellaneous.
Goats,	

Practical Farmers

Know how important it is that the above subjects should be treated from a local standpoint—that generally the farming tactics of the East will not do for this coast, that agriculture, in its infancy here, can derive greater benefits from an exchange of experience through the columns of the press than in older fields. Constantly observing and studying developments in the special field we represent, we can be expected to give truer information on agricultural subjects, than more general writers at home or abroad.

Our Traveling Correspondents

Will do much service by gathering a large amount of interesting information from various parts of the Coast, which, but for their research and practiced observation might never be placed on record or reach the eye of the reading public. Of our many

Local Correspondents

We have particular reason to be proud. No paper on this Coast—old or new—has ever been so highly favored with volunteer contributions. They are talented, reliable, independent and generous representatives of an intelligent and enterprising people, noble types of good humor, unselfishness and true progress.

Short Stories,

Original and selected, will hereafter appear in each number. Their selection, we trust, will be such as to render them popular and unobjectionable to all. In addition to a large number of

Fine Engravings,

Representing Choice Stock, Farm Products, Scenery, Remarkable Productions, Improvements in Farming Implements and Machinery, Works of Art and the Beautiful in Nature, we shall from time to time present the modest

Faces of Prominent Farmers

Who, as pioneers in the development of agriculture on this Coast, or as active laborers in the "Farmers' Cause," are worthy of the distinction they enjoy, and the favor with which they are looked upon by our many readers at home and abroad.

Engravings (costing thousands of dollars originally) are inserted in our columns during a single year. They afford instant and perpetual impressions often more perfect and real than words can convey.

Patrons of Husbandry.

We shall continue to give our weekly summary of matters connected with the interest and progress of this growing and important movement. We shall aim to give information as fresh as possible in this department. Its readers are aware that the RURAL has been in the lead in calling farmers to organize. We shall continue to work zealously with the Granges for the noble objects of the Order.

The present is an

Important Period

In the history of our Coast. The coming 12 months promise greater developments in its agricultural progress than has been experienced in any previous year. Agriculturists are alive to improvements in every direction, and those who would keep up with the spirit of the times should certainly read the RURAL PRESS.

The S. F. Market Reports

Will receive greater attention in the department of DOMESTIC PRODUCE than that of any other weekly journal. We shall spare no pains to render the reports as reliable and complete as possible. By the employment of our special reporter we hope to make this very important part of our paper one of its best and most satisfactory features.

Kind Words and Acts

Have done much to build up in this isolated and sparsely settled coast so large and complete an agricultural journal as the PACIFIC RURAL PRESS. We commence the new year with a regular circulation of

Over 5,000 Copies,

A far greater issue than that of any weekly on this Coast, independent of a daily publication. If our friends will continue to "help us help ourselves," we hope to reach a circulation of 8,000 this year, and do a correspondingly greater service of good. While we have the greatest advantages and can make by far the best weekly for

Agriculturists on This Side of the Continent,

We cannot expect one-half so large a circulation as journals in older and more populous districts. Consequently readers cannot rightly expect such a paper here at Eastern rates.

No Premiums But a Good Paper

Do we offer. A flashy chromo (or cheap map), with an ill suited paper, will hardly satisfy the farmers of this Coast, whose time is too precious for trifling. To many of you the benefit of a reliable and valuable paper should reach a hundred fold its cost, while to all a poor journal would be dear at any price.

Sample Copies Furnished Free

On receipt of stamp for postage.

Agents are Wanted

Who will do more or less active canvassing. To such we will furnish free samples and pay liberally for their services.

Terms of Subscription:

One year (payable in advance)..... $4.00
Six months..... 2.25
To Granges and Farmers' Clubs, furnishing club lists, $3 per annum.

Hints to be Remembered.

A note dated on Sunday is void.

A note obtained by fraud, or even from one intoxicated, can not be collected.

If a note be stolen it does not release the maker—he must pay it.

An indorser of a note is exempt from liability, if not served with notice of its dishonor within twenty-four hours of its non-payment.

A note by a minor is void.

Notes bear interest only when so stated.

Principals are responsible for their agents.

Each individual in partnership is responsible for the whole amount of the debts of the firm.

Ignorance of the law excuses no one.

It is a fraud to conceal a fraud.

The law compels no one to do impossibilities.

An agreement without consideration is void.

Signatures in lead pencil are good in law.

A receipt for money is not legally conclusive.

The acts of one partner bind all the others.

Contracts made on Sunday can not be enforced.

A contract made with a minor is void.

OAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast cannot do their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

SCIENTIFIC PRESS.—The attention of our readers is called to an interesting article on the Mining Interests of Northern Sierra, on the first page of this issue, from the SCIENTIFIC PRESS, San Francisco. This is the ablest, most instructive and influential Mining Journal published in the Great West, and should be liberally patronized by all our mining friends.—*Mountain Messenger*, April 25.

HINTS FOR INVENTORS, We will send on receipt of stamp in postage, FREE, our 52-page Circular containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Government fees, practical hints, etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874,** provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and, if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of August, 1874, an assessment of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of November, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

F. H. WELLS, Secretary.

Office—No. 402 Montgomery street, room No. 23, San Francisco, Cal. sep5

Eagle Quicksilver Mining Company.—

Location of works, Santa Barbara county, California. Principal place of business, San Francisco, Cal.

NOTICE.—In pursuance, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1874, an assessment, No. 8, of one hundred and fifty dollars ($150) per share was levied upon the capital stock of said company, payable immediately, in gold coin of the United States, to the Secretary at his office, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any share upon which said assessment shall remain unpaid on Monday, the 21st day of September, 1874, shall be deemed delinquent, and will be duly advertised on Saturday, the 26th day of September, 1874, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of September, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Rooms 5 and 6, No. 302 Montgomery street, San Francisco. jy25

El Dorado North Mining Company—Location

of principal place of business, San Francisco, California. Location of works, Philadelphia Mining District, Belmont, Nye County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the fourth day of August, 1874, the several amounts set opposite the names of the respective shareholders as follows:

THE
AMERICAN TURBINE WATER WHEEL

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 50.08; ½ 69.64; ¾ 78.73; ⅞ 82.58; ⅞ 82.90. Percentage of whole gate, 88.14.

Mr. Emmerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $40,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v23-tf Oakland.

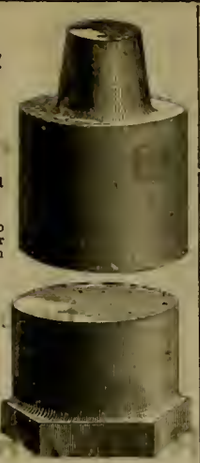
PURCHASERS please say advertised in Sciantific Press.

Improved Cast and Forged STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]



To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

CAST STEEL SHOE & DIE CO.,

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.

THE NEW WINCHESTER REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.

The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motion are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $6 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

VOLUME XXIX Number 13.

The Black Hills Excitement.

The Black Hills excitement prevails to some extent in this city, as well as in the mining districts, and we hear thet several parties are being orgenized here. Already a few advertisements appear in the papers of sanguine individnals who desiro to organize companies of which they are to be leaders. One compeny being formed will start on the 15th of March. Reports of the richness of the gold fields in the Black Hills are at present so contradictory that it is prematnre for prospectors to connt on making largo fortnnes. The recent Stickeen River excitement will, however, be a lesson to many on this coast who might otherwise listen with a favorable ear to the yarns abont the Black Hills.

Prof. Newton H. Winchell, Minnesota, State Geologist and Professor of Natural History in the State University, accompanied the Black Hills expedition in an official capacity. He states that gypsnm, marble, slate, etc., may he fonnd in nnlimited quantities; but on the gold question he is singalerly reserved, merely remarking: "The miners that accompanied the expedition report the finding of gold and silver, though I saw none of the gold, nor did I see any of the auriferous quartz. I have taken the gold reports with a large grain of allowance." Prof. Donaldson, late of the State University, Minnesota, perfectly agrees with the conclusions of Prof. Winchell upon the gold question. The views of Prof. Winchell were stated more fully at a meeting of the Minneapolis Academy of Natural Sciences.

Prof. Winchell said that he did not see any gold in the Black Hills, nor did any one bring any to him for examination. Some brought what they thought was gold-bearing quartz, but on examination he found it to be mica scales stained with iron rust. Iron often gets into mica and colors it, causing frequent mistakes in that way. He could not say bnt that there was gold there, and same parties may have discovered gold, bat he saw none, and therefore he was of the opinion that there was none there. He was led to the belief thnt the reports of gold were gronndless from another reason, viz.: that the character of the men who telked np the expedition, nrging the government to explore the Black Hills, would leed anyone to mistrust their statements. These men were miners and adventnrers who profess to be practical miners, bnt who have always lived on and profited by excitement. They were stock-jobbers, who probably owa extinct claims now in different parts of the country, and who wished to profit out of this expedition.

The reporters accompanying the expedition derived all their information concerning the reported gold discoveries from these men, and so did General Custer. No one but these men pretended to have taken ont any gold, or to have seen any. It would have been very easy for them, with the view of reising this excitement, to have taken with them a quantity of gold dnst and then washed it in their pnns.

He did not meen by these remarks to dissnade men from going to the Black Hills, bnt he did not wish them to go and expect to return loaded down with gold nuggets, under his representation.

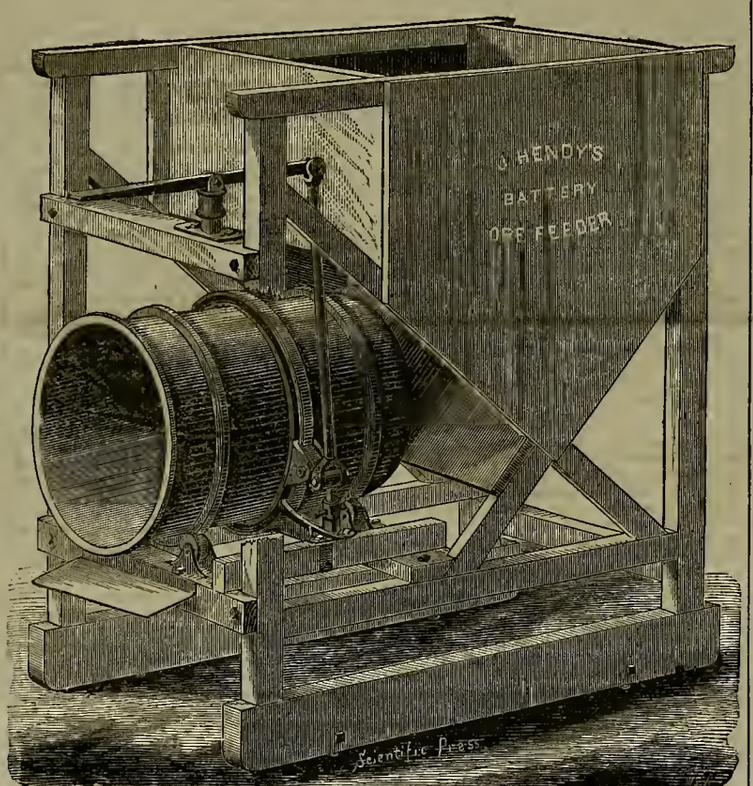
He disclaimed any personel feelings against the men referred to. He hed been on friendly terme with them, and, as far as he had any intercourse with them, they had treated him courteonely; bnt he did not think thet in his position he onght to senction by his silence the wild fever which hes now been excited.

A gentleman recently from the vicinity of the Little Salmon river, says that good paying diggings heve been fonnd on that river, abont 23 miles from Fort Shepherd. Thie river empties into the Pen D'Oreille leke, and was known to be auriferous, bnt prospecting of any importance hed never been attempted. The miners now working find the gold in the bare, bnt have to pack the pay dirt down to the river; even in this way they can meke $10 to $15 per day to the hand. The gold is scaly, and assays $17.50 per ounce. A large nnmber of claims have been recorded.

A new public road to Panamint via Mojave will soon be opened.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Dr. Harkness occupying the chair. Among the additions made to the museum were 21 specimens of fossils from Alaska, and six jars of alcoholic specimens from the same country, received through the office of the United States Coast Survey. The fossils were bones and teeth of the mastodon, generally of more enormous dimensions than hitherto procured from that locality. Four



HENDY'S ORE FEEDER FOR QUARTZ MILLS.

jars of alcoholic specimens from Central America, composed of centipedes, hippocampus or sea-horse, and flying-squid, were received from J. C. Merrill. The regular exchenges and scientific publications for the library were laid on the table.

W. N. Lockington read an interesting paper on the crustaceans of the Pacific Coast.

Dr. Cooper, late of the State Geological Survey, made some remarks on the coal formations of this coast, referred to at length in another column.

Judge Hastings read several short, characteristic papers, which were listened to with fortitude by the members.

The following resolutions, expressive of respect for the memory of a much velued member of the Academy, the late Curator of the museum, were submitted by the Trustees and unanimously adopted:

Whereas, The will of a Divine Providence has taken from our midst our fellow-worker, Hiram G. Bloomer; therefore, be it

Resolved, That this Academy desires to record its sincere and earnest regret at the loss of one of its members, so honored for his gentle and kindly nature, so respected for his principles of truth, so worthy of admiration for his enthusiastic love of science, and his generous desire ever to impart information, as the friend who has been recently called away from us; and its belief that by the unexpected death of Mr. Bloomer a gap has been caused in the ranks of its officers which it will be difficult to fill.

Resolved, That in the loss of Mr. Bloomer we recognize the departure from amongst us of a brave and noble spirit, who, amid many of the hardships of life, clung persistently to the pure love of the beautiful, and who, in his unselfish devotion to his favorite pursuits, has left an impress upon the future of our State which in after years will be more fully recognized and known.

Resolved, That we deeply and sincerely sorrow over the sad and sudden bereavement which Mr. Bloomer's family have sustained, and offer to them our heartfelt sympathy in the hour of their affliction.

Resolved, That these resolutions be printed in the proceedings of the Academy, and that a copy of them be forwarded to the immediate relatives of the deceased.

In moving the adoption of the resolutions, Prof. Bolander recounted the great services the deceased had rendered the Academy. His devotion to the cause of science had doubtless hastened his death. Mr. Bolander made a supplementary motion that a committee of five be appointed to catalogue the valuable donations Mr. Bloomer has made to the Academy in books and specimens, with a view that some recompense be made to his family.

This motion was also adopted, and the Chair appointed as such committee Prof. Bolander, Dr. Kellogg, Henry Edwards, R. E. C. Stearns and G. W. Harford, to report at the next meeting.

Thomas Guinean, of Sacramento, has a party of miners engaged in prospecting for coal in the mountains a few miles above Monticello. A tunnel has been run in some 150 feet upon a vertical seam of coal of a few inches in thickness.

So much coal has been taken out at the Tenino mines in excess of means for transportation, that the working force has been considerably reduced.

The Pacific Edge Tool Works.

The Pacific Edge Tool Works, W. F. Palmer and S. F. Blasdell proprietors, is an institution just started in this city, and is in every way worthy of encouragement. The works occupy a well-ventilated, roomy shop on Berry street, between 4th and 5th. At this place are manufactured cast steel edge tools for ship and house carpenters, caulkers, block and pump workers, coopers, butchers, etc. There are in the shop a steam engine, four forges, a blower, grindstones, and everything complete for grinding and polishing tools. Grinding and polishing is done for the trade as well as for their own works. The very best material is used, and none but the best brand of English steel is put into the tools.

This new home manufacture was commenced on the 13th of August, and they have not yet got fairly started. Mr. Palmer, late of New York, and of the firm of Sheffield & Palmer, Stamford, Conn., has had 30 years' experience in the business, so that they are confident that they can turn out tools as good as any in the market. There has been no one here before who could do this class of work. All of their tools are warranted, which is a great advantage to purchasers. Parties buying warranted tools which are made in the East are no better off than if they were not warranted, as they have no chance to return a poor tool to the maker. If carpenters or others buy plane irons, chisels, adzes, drawing knives, etc., of a firm in this city which warrants their work, if the tools are found to be burnt or otherwise defective, they can be exchanged for perfect ones. Of course, as the enterprise has just been inaugurated, tools with the "Palmer" brand on them, are very little known as yet; but the proprietors of the works are confident that when they are known, their business will increase, and they propose enlarging their works. They sell to the trade and to individuals, supplying stores when desired. Tools can be repaired here now and need not be thrown away as heretofore when injured. There have been no tool works here before where tools could be re-edged and repaired, and the establishment of this will be of great advantage to carpenters and others. Mechanics using edge tools will do well to examine the display of the Pacific Edge Tool works in the Mechanics' Fair, or call and examine samples at the works.

Hendy's Battery Ore Feeder.

We illustrate to-day a new style of ore feeder for quartz mills, designed by Joshua Hendy, of this city. This machine consists essentially of a hopper and an inclined revolving iron cylinder, the latter actuated by the drop of the stamps, through the medium of a lever with connecting-rod and friction grip. At the drop of the stamps, the tappet strikes the end of the lever and lifts the grip, thereby causing a partial revolution of the cylinder. The re-action which would otherwise be caused by the weight of ore upon that side of the cylinder is prevented by a friction brake working in a groove beneath the grip. The ore as discharged from the cylinder is received upon an apron which has an inclination both forward and towards the battery, thereby causing it to be distributed more evenly. An adjustable screw underneath the grip determines the rate of feed.

This machine is in successful operation at the Pacific Reduction Works, in Alameda county, and at the works of the Auburn Mill Co., Reno, Nevada.

The steel rail now being laid down by the Central Pacific Railroad Co. between Truckee and Blue Cañon, costs at the rolling mills in the Atlantic States $120 a ton. The iron rail costs about $65 a ton, but only lasts about one-fifth as long as the steel rail.

Panamint is looming up rapidly. Lots are in great demand and command good prices. Extensive preparations are being made to work Senator Jones' mines.

The San Diego mines are expected to produce $400,000 this year.

Refining Base Bullion.

A correspondent of the Eureka *Sentinel* gives the following description of his visit to the Germania Refining Works, situated about six miles south of the Salt Lake city, on the Utah southern railroad. The main object of these works is the separation of the precious metals from the lead in the so-called base bullion, by means of zinc, or, technically speeking, the desilverization of lead by zinc. As it may not be nninteresting to a large number of your readers to get an idea of the execution of this process, I will in the following try to give a brief description of the menipnlations carried on at the works above mentioned. Previously it will be necessary, however, to make a few general remerks. The zinc desilverization process is based upon the following facts:

1. Zinc has a greeter affinity for silver and gold than lead.
2. It does not form an alloy with lead.
3. It has a lesser specific gravity than lead.
4. The melting point of zinc is et 412° C., while that of leed is et 334°.

If metallic zinc is added to molten base bullion at a temperature higher than the melting point of the former, the zinc forms an alloy with the gold and silver of the lead bullion, and, in cooling down, rises to the surface of the now impoverished lead, which must be kept in a state of fusion, covering the whole of the lead in the shape of a hard scum—the zinc scum. This scum is teken off from the leed-bath, and as it still contains a large percentage of lead, is subjected to a liquetion process, by which the lead is sweated out to within about 2¼ per cent. The zinc scum from this operation is the silver producer; the remeining lead being zinciferous, must be softened, end is then ready for the market. From the above, it would appear thet the zinc process is composed of three main operations:

1. The desilverization of the lead bullion.
2. The dezincification of the poor lead.
3. The desilverization of the zinc scum.

Desilverization of the Lead Bullion.

After the bullion is sampled and assayed, from 20 to 22 tons are introduced into a large calcining furnace, the bottom of which is encased by e strong cast-iron box. Here the bulliou is melted and then subjected to a dull red heat, air being admitted through the work-doors, whereby most of the mecbanical impuritiss, consisting of iron and coppsr mette, and a portion of the antimony, arsenic and copper, in the shape of their oxides, are brought to the surfece of the metal, in consequence of their lesser specific gravity. These impurities are known nnder the name of *dross*. As soon es the surface of the metal is completely covered with dross, this is skimmed off and removed throgh the work-doors. It still contains precious metels. We will call it "first dross." The lead bullion in this celciner is then tapped, end, by means of an iron spout, conveyed into either one of the two largest of a system of five cast-iron desilverizing pots. These pots, or kettles, are set in the shape of a wedge, the two lergest ones forming its basis, the smallest one the point. As the works are rnnning at helf capacity at present, that is, 20 tons of bullion per 24 honrs, only one series of pots is in use, viz: one large one, one middle one end the one at the point. Eech pot has its separate fireplece, which derives its draught, like all the other furnaces, from a stack 90 feet in hight.

The Lead Bullion

In the first pot is now exposed to a temperature high enough to smelt a certain percentage of zinc, which is added in a sort of an iron cege attached to a stirring contrivence. As soon as the zinc is believed to be sufficiently mixed with the bullion the stirring epperatus is withdrewn end the temperatnre ellowed to go down to the melting point of leed. The scum, which now rises to the surfece, is ladled over into the adjoining smaller pot, melted, stirred, and cooled, and skimmed as before, the skimmings being transferred to the last and smallest pot, in which they have to nndergo the same manipulations. The scum from this last pot is the rich scum and goes to the alloy furnace. The leed from the second and third pots is returned to the first pot by meens of a connecting gutter, into which the lead is ladled. Hereafter a second end afterward a third addition of zinc is mede in pot No. 1, and the ensuing scums are treated in the same menner as before, with the sole exception thet the final scums are not taken to the alloy furnace, but are nsed over again instead of metallic zinc, they being too poor in precious metals. The liquation lead (lead sweated out) from these laet zinc addition, is returned to the firet pot, whereupon the latter is emptied, through a spont at its bottom, into a softening furnace—of which there are two, one connected with each large pot.

Dezincification of the Poor Lead.

The lead from the first pot is now practically desilverized, ae it containe only 15 grammes of eilver, or less than 1-11 of an ounce in the ton; but it ie hard, owing to a small percentage of zinc being retained in it, and to the presence of arsenic and antimony, if such have been in the original bullion. To remove these impurities the lead is exposed to a dull, red heat in the softening furnace, and from time to time stirred with a hoe to offer a new surface to the oxidizing agency of the air. As soon as the lead is perfectly covered with dross, and the samples teken out of the furnace from time to time by their peculiar luster and crystalline texture demonstrate its purity, the dross is removed through the work-doors and the lead is tapped into a large cast-iron pot with fire-place. Here the lead is poled for several hours, thet is, stirred with a pole of green wood, whereby it assumes a bubbling motion and thus gives a large number of surfaces to tbe air. By this operation the lest traces of zinc are removed. Through a movable spout at the bottom of tbe pot the lead is run into molds branded "selected" or "common" lead, according to its purity. The dross is reserved for further working; we will call it *poor lead dross*.

Desilverization of the Zinc Scum.

The rich zinc scum, es I said before, is treated in the alloy furnace. This is a blast furnace of smaller dimensions than the enormous ore-smelting furneces of Eureka. The scum is smelted in conjunction with pieces of scrap-iron and ore-slag, Pennsylvania coke serving as a fuel. The smelting is done at a low temperature under a pressure of blast. By this operation the zinc is, for the most part, volatilized as oxide of zinc, which is caught in a condensation cbamber attached to the furnace; but the silver and gold remain with the lead, which was intermingled with tbe zinc scum. This "rich lead" is tapped below the furnace hearth and ladled into molds, and is then passed over to the cupelling furnaces. The slag is not kept running continuously, but tapped at intervels, the breast of tbe furnace being closed in the meanwhile. Tbe slag is used over in the ore-smelting furnaces es a flux. As enother residual product, we heve zinciferous iron-sows, which form a crust around the heerth of the furnace and have to be detached by mechanical means. They look very much like our speiss or "iron," as it is commonly celled, and mey be used in the desulphurization of galena.

The rich lead is cupelled iu an

English Cupelling

Or refining furnace, of which thero are six in the works. The bottoms, cupels or tests, of these furneces are made of bone ashes, and have an oval shape. Before use they are dried and anneeled. Tbey rest on two strong iron bars in tho furnace proper. At tho back wall of the furnace there is an opening for the blast, which is created by steam, and on each side of it a charge-hole. At tbe front well there is an opening for the discharge of the litharge, and sideways from the test there is a fire door. The test is placed in the furnace in such a manner that the plane of its long axis passes through the center of the tweer-opening and the discharge.

The cupelling process is based upon the following circumstances: If en alloy of lead and precious metals is fused and then exposed to a current of eir, the entire lead is grednally converted into oxide of or litharge, as it is generally termed, leeving fually an alloy of the precious metals.

The rich lead is now introduced through the cherge-holes in the test, ber by bar, and melted. As soon as the test is filled up to the rim the blest is turned on and the heet kept up at the same time.

The Formation of Litharge

Begins, which is partially absorbed by the porous test—pertially drawn off into a gutter cut into the test on the discbarge side. The litharge is run into pots mounted on wheels, end removed when filled. As soon as the metal bath has decreased sufficiently in size more rich lead is introduced into tbe cupel, till it is supposed to contain tbe quentity of silver desired. The blest is continued until the brightening of the silver has teken place, when no more litharge is perceptible, and then the operation is finished. A hole is now bored into the bottom of the test, and the refined metal drewn off into molds resting on a movable frame. The silver bars thus obtained are remelted in bleck lead crucibles, cast into ingot molds, assayed, and can now be sold to tbe banks. They are then .996 fine. The litharge is accumulated for furtber treatment. The test is broken np and assorted.

The Untarnished Portions

Of it are used over again, while the balance goes to the ore smelting furnace for tbe extraction of the metels it contains.

It now remains for us to state briefly what is done with the residual products, in which there is still a good deal of money value hidden. Tbe first dross from the calcining furnace is liquideted in a furnace constructed especially for that purpose by Mr. Weise, the superintendent. It is a reverberatory, with two bottoms, one above tbe other. The upper one is composed of grate-bars with narrow slits, and is charged with the dross. The lower one consists of composition, and has a steep pitch toward the tap-hole, in front of which there is a cast-iron receptacle. The temperatnre is now conducted so that the lead trickles out of the dross into the lower hearth, but leaves the balance unfused. This dross is then withdrawn, and smelted for copper-matte, with iron pyrites, which is not further treated on the spot. The lead goes back to the desilverizing pots.

The Poor Lead Dross

Is smelted directly with sleg for antimonial or hard lead (type metal) in a cupola furnace. This lead commands a good price. The litharge from the cupelling furnaces ie revived in a reverberatory furnace; that is, it is mixed with stone coal, exposed to a melting heat, whereby it is reduced to metallic lead. As the litbarge ie neither very pure nor free from silver, the reenlting lead has to be returned to tbe desilverizing pots.

Exclusive of the furnaces heretofore mentioned, there are three more furnaces on the ground destined for the reduction of rew ores and by-products. One is an English flowing furnece, for the production of lead bullion and gray slag (slag rich in lead) from rich gelena ores. Tbe gray slag is further treated in one of the two remaining cupola or blest furnaces. I herdly need to sey tbet all ores not fit for the reverberatory ere smelted in tho latter with the proper flnxes.

The Blast Furnaces,

One of which is provided with all the modern appliences (water jeckets), receive their blast from a large-sized Sturtevant fen, propelled by a 45-horse-power engine. All the furneces are provided with dust-chambers connected with flues, wbiob run into the main flue, the latter terminating into a tall stack. The only fuel required at the works is raw *stone coal* for the reverberatory furnaces, desilverizing pans and the steam-engine, and *coke* for the blest and assay furnaces.

Finelly, I cennot forbeer to praise the urbanity and willingness of the gentlemen in charge to give information—Mr. Billing, the business manager, end Mr. Weise, the superintendent.

Low Grade Ores.

The question of the utilization of low grede ores, says the Eureka *Sentinel*, is one which hes, heretofore, been too generelly overlooked throughout Nevada. In Europe a system of concentration is now and has been for many years in successful operation, end through its means very nearly all crude ore is prepered for the reduction. What little rich material occurs throughout the vein matter is carefully separated by hend; whilst tbe residuum, by far the major portion, is orushed, jiggsd, passed over the shaking table, round buddles and plane tables, until a working product is obtained ready for the final manipulation, generally in the furnaces. It would surprise the majority of our millmen to learn how small a yield in the lead and the precious metels is deemed worthy of a preparatory treatment. It is not unusual to submit to concsntration ores which will assay two to three per cent. of leed, with from five to $15 in silver to the tou. So perfect, indeed, is the mechanical errangement of many of the works thet as high as 75 stamps may be seen at work and not a single attendant in sight. The batteries are self-feeders; the crushed pulp passes first into and over a series of obloug boxes, fitted underneath with pyramid-shaped bottoms, from whence the sends, sinking each according to their respective gravities, are projected through a metallic pipe upon a series of continually-moving sheking tebles. The very finest slimes are collected in properly proportioned settling tanks, whenco they are taken on tbe buddles to plane tables.

The method of universel application throughout England, France and Germany depends upon the agency of water, carrying along and holding in a temporary suspension the various comminuted particles of ore and gangue.

With us, however, water iu sufficient quantity is not always attaineble, and the inventive genius of our people has been taxed to find enother medium, which shall combine in a more delicete manner all tbe requisites of quantity, elasticity and ease of applicetion. All these have beeu found in a combination of crushers, rolleis, separating sieves and jets of atmospheric air. The current of air may be regulated so that its wave-like impulses act on the suspended ore particles precisely as the weter in the jiggiug machines; in fact, being a more attenueted medium, it does not offer too harsh a resistance to the most delicate atom of tbe so-called noble silver ores, and may be equally as well applied to the commonest of the base leed and copper minerals.

Already, for several months, one of these "dry eir concentretors" has been in successful operatiou in Nevada, and we learn that another and larger machine is to be set up in one of our most successful mills. We shell wetch with more than ordinary interest the progress of the experimont, which is, indeed, in the right direction.

Here, right in our midst, there are thousends, not to say millions, of tons of low grade leed ore, which will essay from five to eight per cent. in lead, and from, say, five to 15 dollars in gold and silver, which are practically worthless. At best they ere, if of an irony character, only aveileble as flux. Conld they be concentrated, say four or five tons into one, they could be smelted with profit. We commend this snbject to the cereful consideration of our furnaco men, whom we shall endeavor to keep informed as tbe experiment to which we allude progresees.

Manufacture of Chlorate of Potash.—To manufacture chlorate of potash on a large scale, it has been recommended by W. Hunt to adopt the following method: Milk of lime is made to trickle down over bricks, pleced in a tower where it comes in contact with a coutinuous current of chlorine gas. Chlorate of lime is the chief prodnct, and, by treating this with chloride of potassium, chlorate of potash is formed, which can be purified by cryetallization.

Natterer, a German pbysicist, by more modern applianoes, succeeded in obtaining a temperature of 220° below the freezing point of water, and Dr. Kane obeerved a temperature of 76° below it. Jonle, an eminent English physicist, calculated, from the law of the expaneion of gases, that a temperature of 459° degrees below the freezing point of water wonld probably be the absolute zero.

New and Old Towns in California.

The mining towns, says the *Bulletin*, of California have been "cremeted" once, twice, and some of them three timos. The very bones of these towns have besn burned np. And this has happened, genorally, after the resources throngh which they have been built up have been partially exhausted. Nevada at one time had a population of not less than 15,000; that is, there were this number which were near enongh to depend upon the postoffice in thet town. Three great conflagrations have swept over the town, yet it is to-day just about as much of a place es it would heve been had no fire consnmed it. In the autumn, according to precedent, we expect to get the news of the burning of two or three mining towns. The buildings are chiefly of wood. There is always e Cbinese querter with all the appliances for touching off e fire suddenly; high winds and materiel exposed to the hot sun until it it almost ready for spontaneous combustion, will ordinarily insure a sweeping conflagration. And so it happens that nearly every mining town of eny prominence hes been tried by fire. Mokelumne Hill hes been swept for the sscond or third time. It will be restored again, beceuse its resources are not confined to a few wooden houses. The eigbt or ten thousend people who used to he tributery to the "Hill" are not there now. We shell heve only the 2,500, more or less, who will still cling to its fortnnes, and hold, with a good deal of justice, thet it is one of the healthiest and most picturesque towns in the world.

After snch a disastrous experience the wonder is that greater precautions are not taken against fire in these mountain towns. Thus, at Mokelumne Hill there is a kind of lava-rock nearly or quite fire-proof, and yet so soft when it is uncovered thet it can be cut with an ax, and can be prooured witbout limit. We do not hear that any of the buildings constructed of this rock were destroyed. In the vicinity of all tho mining towns there is an abundance of rock within eesy reech which may be had without other expense than thet of hanling. The rough stone cottage is cheap end comfortable. There are no earthquakes in the mountains to shake it down, and the fire will not consume it. If these mountain towns were construoted from thg waste rock everywhere accessible, they would be among the most picturesqne towns in the world.

But in respsct to combustible material, the mining towns are herdly worse off tban is San Francisco. We have a wooden weter-front, and two-thirds of the area of the city is covered with wooden buildings. We have a better police supervision end a moro efficient fire dspartment. These are about all we have to reduce the contingencies of a sweeping conflagration. An artisan has recently shown the practicability of inclosing ell wooden houses in cities with a brick sbell. He demoustrates that it can be done at comparatively small expense, thet the value of houses so treated is grsatly enhanced, and that all objections to wooden houses would be thereby avoided. The brick shell would sustain only its own weight, and there wonld be little reel denger from earthqnakes. These double houses may yet come into favor, but we are not ready for them yet. At presnt, wooden housss are popular, and the more so as they admit of much cheap and meretricious oruamentation.

New mining discoveries will create new mining towns, and these will follow the fortunes of the mines to a large extent. But the most promising new towns will spring up along the coest. A considereble town will resnlt from the colony settlement of tbe Lompo ranch, just north of Point Conception; Monterey will be recuscitated, partly through the influsnce of a locel railroad, and the development of agricultural wealth. Santa Berbare has grown from a Mexican hamlet to its present dimensions within the last eight years; and San Diego, with a fine harbor in front, end a paper reilroad in the rear, hes done wonders.

It is now evident that there will be a chain of flonrishing towns along the coast, built up largely throngh agriculture end local commerce. These will never go beckward, beceuse the chief elements of prosperity are not likely to fail. In early times there were towns laid ont, like "New York of the Pacific," which never came to anything. They were started without resources and es a crazy speculation. They never progressed far enough to furnish a respectable rnin. But the new coast towns, deriving their life from popuietion and bnsiness, will be both permenent and prosporous. There is room for at least 20 such towns. Many of them may be swept by fire as the mountain towns have been. Bnt the white wooden towne by the sea will be likely to hold on their way until the bottom falls out of agricultre and commerce—which will certaiuly not be in our time.

French Railway Cars.—Some of the double deck cars, which are quite common upon French roads, exhibit an almost extraordinarily emell proportion of dead weight. One on exhibition at Vienna, with a capacity of 90 persons, weighed only 11.75 tons. Freight cars weighing but 10,000 pounds carry 20,000 or even as much as 30,000 pounds.

Lap for Polishing.—I dare say many will at once say "It won't do," but for many purposes no emery glued on anything, or made np in any way, is so simple and effecinal as a plain piece of hardwood turned to the shape reqnired, and smeared with emery and oil.—*English Mechanic.*

SCIENTIFIC PROGRESS.

Science Reads an Oracle Relating to the Metallurgy of the Future.

One of the most interesting incidents nf the visit nf the American Society of Civil Engineers to the Stevens Institute of Technology, at Hoboken, anggested the above title for our article. After witnessing the beautiful experiments exhibited by Professor Morton, inspecting the multitnde nf interesting objects in the lecturs room in the Department of Engineering, and spending a pleasant quarter of an hour with Dr. Mayer among the myaterious physical apparatns of his laboratory, the party orowded into the little lecture room of Professor Leeds. The Professor had thrown upon the screen the images of several contorted and rather uninteresting looking specimens of mineral. These, he ataes, wsre pieces of "tulgurite," or thunderbolt, as it is nften called, sent him from North Carolina. When a heavy finsh ot lightning strikes the earth, it sometimes fuses tho soil in its track, and, on solidification, it becomes a solid har or rod, which may be, and often is, dug ont of its bed. In this case, the lightning had penetrated a bed of pnre white aand, melting the silex and forming a hollow shaft two or three inches in diameter and four feet long, filled within and surrounded without by the white sand of the locality. The shaft, however, was not white. Its color varied from a dark to a white pearly gray. Chemical analysis showed it to contain iron, and so accurate was the work that, on estimating it ns nsual, as oxide, ths figures proved some error to have occurred. Estimating it as metallic iron, the figures were correct. Apparently, therefore, the fulgurite was discolored by finely divided metallic iron, and this deduction was confirmed by other and direct experiment. This would explain the peoaliarity of color, since the oxide would have colored the silex green. But metallic iron does not exist in natnre on the esrth's snrface, and the chemist wns compelled to seek some explanation of its existence here by an examination of the peculiar conditions under which it was produced.

The final conclusion seemed necessarily to be that, at the immensely high temperatnre nt which silica melts(the extreme limit attainable with the oxyhydrogen blowpipe), iron "dissociates" from oxygen, and that here, dissociation having occnrred, the metallic iron, transported by the electric flash from some snbterranean deposits, become sncased in molten sand, and was preserved unoxidized within the fulgnrite. The melting of that immensely refractory material, silex, the dissociation of iron from oxygen, and the transportation of such an amount by electrical action, were circumstances at once remarkable and interesting. Professor Leeds then gave his fellow members of the society and ot his profession an ontline or the possible hearing of this onrious instance of natural metallurgy npon the futnre of the art. He stated that, whils it could hardly yet be considered as probable, it csrtainly did not appear impossible that at some future time the processsea ot art might imitate what was here seen accomplished by nature, and that this interesting phenomenon might be a strong intimation ot the dirsction in which metallurgical changes might lead. Could a material be obtained of which to build a furnace which should be capable of resisting the temperatnre at which silex melts, and could such a temperatnre be attained in the furnace, we need but throw our ore upon the bed of the furnsoe and allow it to reach the temperature of dissociation, when the oxygen would pass off up the chimney, without the nse ot carbon or other deoxidizing agent, and the metal would flow down upon the hearth. The requirement of a nsw retractory material may not improbably bs fulfilled. Eqnally remarkable discoveries are frequently made. The attainment of so high a temperatnre nscessitates probably the invention of a method of preventing the dissociation of oxygen and hydrogen by high tsmperature. As we also have stated, in an editorial article in our last issne, the limit of combination ot these gases, or their temperatnre nf dissociation, is stated by Deville at about 4,500 degs. Fah., and this is, therefore, the limit ot temperature attainable by their combustion. Oxygen and carbon dissociate at a lower temperatare.

The speaker relerred to the possibility that this elevation of the limit may be attainable hy carrying on combustion nuder presaure, as already proposed by Bessemer, and as probably illnstrated in some slight degree by the elevation ot pressnre within the converter, and the extraordinary temperatnrea there observed. This interesting aubject and the novel ideas auggeated by it were evidently looked upon as important aa well as entertaining hy visitors, one of whom expressed the idea which is embodied in the title which we have assumed for our article, and nearly all of whom forgot professional dignity so far as to applaud heartily. Many of our readers, by the character of their pursnits, are also interested in this anbject. We hope that aome may be so fortunate as to be able to aid in securing the benefit here indicated as possibly attainable.—*Scientific Am.*

One of the oldest experiments made on a large scale to ascertain the amonnt of heat prodnced by the frictional resistance of a certain given power, was made by Benjamin Thompson, of Concord, N. H., known in Europe as Count Rumford.

Simple and Cheap Glass Cells.—Mr. F. Clowes, of Queenwood college, Hants, sends to *Nature* the follow deacription of a method for extemporizing glass cells with parallel sides: "A piece of India rubber tnbing (or solid rnbber) bent into a semi-circular form is placed between equal sized rectangular plates of glass, the ends ot the tube terminating at the upper edges of the glass plates; the plates are then held together by passing two strong India rubber rings over their ends. If the rings are of such a size to exert the requisite compression, a semi-circnlar water-tight cell is thus obtained, which can be taken to pieces and cleansed with great ease. A trough so made served well to exhibit with an ordinary magic lantern the experiments described in Tyndall's 'Heat a Mode of Motion,' and smaller cells suitably fitted with platinum wires, and held in the wooden frame nf an ordinary lantern slide, enabled the galvanic decomposition of aoidulated water and of saline solntions to he thrown upon a screen and thus rendered visible to a large audience."

Improved Method of Generating Chlorine. It has long been known that at a high temperatare a mixture of chlorhydric acid and air is converted into water and chloriue. Deacon of Englnnd thus applies this trnnsformation. Chlorhydric acid gas at a temperature of from 370 to 400° C. is passed into a vessel containing pisces of porous clay which have been soaked in a solation of sulphate of copper and then baked. The oxide of copper in the pores is converted into the chloride of copper while water is formed. This chloride, when the baked clay containing it is subjected to a current of hot air, is transformed into oxide; the evolvèd chlorine passed through water to absorb any H Cl which had escaped decomposition, and then dried, is passed into the chambers where the chloride ot lime is manufactured. Meanwhile the oxide of copper is made into chloride ready to evolve Cl again.—*Polytechnic Bulletin.*

Certain improvements in the methods of and materials for decarbnrating cast iron and converting iron into steel, originate with Mr. C. Binks, chemist and metallurgist, Westminster. In the manufacture of aniline a residual product is obtained, consisting chiefly of precipitsted magnetic oxide of iron with some organic matters containing carbon and nitrogen; and this compound is proposed to bo used for the decarburation of oast iron, in the production of malleable iron, either alone or in combination with the carbonate of soda or of potash; as also for the treatment of cast iron in its conversion into steel, and for adjusting the relative proportions of the iron and azotized carbon in relation to the constitnent elements of steel.

The use of infusorial earth as a nou-conductor of heat is suggested by the *Monetary and Mining Gazette.* Tripolite or infusorial earth, being a worse condactor of heat than coal ashes, and almost as poor as flax chaff, and being refractory, is adapted for walls of ice-cellars and fire-proof safes, for casing steam boilers and pipes, etc., and possesses the advantage of affording protection against rats and mice. Its lightness is also a great recommendation. One cubic foot of it weighs 21½ to 26 pounds; the same bulk of dry coal ashes 40½ to 42½ pounds, and of dry earth 94 to 128 pounds. For casing steam pipes it is mixed with dry flax seed.

Mr. Proctor thinks there are several reasons for believing that the planet Jupiter is not inhabited. The first is its distance from the sun, which so greatly diminishes the amount of heat received thst our lecturer believes it to be inefficient to snstain life of any kind. Another reason is, that the apparent changes in color of the planet's surface, ascribed by all astronomers to the changes in the cloud-masses in its atmosphere, are so great and sudden that Mr. Proctor thinks the heat of the sun is an inadequate cause for them, and that the planet itself must be in a heated state approaching incandescence.

Metallic Alloys.—Mr. H. Hann, of London, has patented (for J. A. Jacoby, of Hamburg) an invention which has for its object improvements in the composition of metallic alloys applicable to various other usetul purposes, such as reducing friction in bearings and other parts of machinery, resisting oxidation, being also comparatively cheap and economical. Metallic alloys made according to this invention consist of from 70 to 73 per cent. of copper, from 9 to 11 per cent. of tin, from 15 to 20 per cent. of lead, and from 0.05 to 1 per cent. of zinc.

A German chemist has discovered a procesa by means of which paper may be rendered impervious to moiature. He statea that it is sufficient to immerse the paper in an ammoniacal solution ot copper; when the paper is completely dried, it will, with difficnlty, lose its consistence, even in boiling water. The ammoniacal solntion which he employs is Schweetzer's liqnor, obtained by treating platea of pure copper with a concentrated solntion (88 per cent.) of aal ammoniac while exposed to the atmoaphere.

Recent experiments by M. Sorel prove that carbou retains its reflecting capacity even at the highest temperatures. A snnbeam becomes reflected by diffnsion and is polarized in exactly the same manner, whether it falls upon a brilliant flame or upon earth.

MECHANICAL PROGRESS.

The Sand Blast Again.

In a paper read before the British Association, Mr. Newton said: When effects on patterns of a delicate nature are desired, and only small quantities of material are to he removed, the blast of air from an ordinary rotary fan is used as the propelling medium. Sand driven by an air blast of the pressure of four inches of water, will completely grind or de-polish the surface of glass in ten seconds. If the glass is covered by a stencil of paper or lace, or by a design drawn in any tough elastic substance, such as half-dried oil, paint or gum, a picture will be engraved on the surtace. Photographic copies in bi-chromated gelatine, from delicate engravings, have been thns faithfully reproduced on glass. In photographic piciures in gelatine taken from nature, the lights and shadows produce films of gelatine ot different degrees ot thickness. A carefully regulated sand-blast will act upon the glass beneath these films more or less powerfully in proportion to the thickness of these films, and the half-tones or gradations of light and shade are thns produced on the glass. It the sand-blast he applied to a cake of resin on which a picture has been produced by photography in gelatine, or drawn by hand in oil or gum, the bare parts of the surtace may he cut away to any desired depth. The lines left in relief will be well supported, their base heing broader than their top, and there being no under-cutting, as is apt to occur in etching on metal with acid, an electrotype from this matrix may be made and can be printed from in an ordinary press.

The process had also been used for cleaning the exterior of buildings, and it was intended some fine day to polish np St. Paul's and Westminister Abbey. This could be done very rapidly and without injuring the sharp lines or edges of the masonry.

A nnmber of beautiful and curious specimens of glass, marble, slate, granite, etc., operated on by the process, were exhibited during the reading of the paper, and excited the most intense interest. Among these was a plate of glass about half an inch thick, which had been pierced through in about ten minutes, and also a large flat file, in which a slit about four inches long and three-eighths of an inch broad had been cut by the sand-blast.

Mr. Newton stated, that small shot or grains of cast iron, of about one twenty-sixth ot an inch diameter, in place of the sand, have been found to cnt granite more rapidly; probably because they are not broken by the shock, and the whole force of the blow is thus expended in disintegrating the stone, instead of being partly wasted in ornahing the grains of sand.

The following suggestive paragraph on the same subject we take from a prospectus of a company projected to work the invention: Although the sand-blast has not yet been practically applied to quarrying for slate, either for slabs or roofing slates, it is very confidently believed (from experiments that have recently been made) that the invention may be very advantageously applied for those purposes; and not only will there be a great saving in labor, bnt a large proportion ot the blasting required to get the slate ont of the quarry may be dispensed with, and a great deal of the waste material which now takes place may be avoided. As this waste frequently amounts in weight to as much as nine times the weight of the marketable article produced, it will be seen that there is a wide margin for the profitable use of the iuvention, and for preventing waste. The process is also applicable to quarrying stone and for cutting hard rocks in tnnneling in the construction of railways. It is believed that in tunneling operations, in many kinds of rocks, a large proportion of the blasting now required may be dispensed with by making nse of the sand blast.

A new electric whistle for locomotives is now coming into use in France. It is intended to take the place of switch signals; opening the switch causes a copper plate a short distance off in the roadway to become electrified. A metallic brush on the engine transfers the current to the whistle, which is opened, and remains open until the steam is shnt off by the engineer. If the engineer is neglecting his dnty, the fact is at once made known by the continuous sonnd ot the whistle.

A French journal connected with the metal trade gives the following cnrious estimate of the value of a piece of iron costing in its rough atate 1f., after being employed for different manufactures. Made into a horseshoe it is worth 3f.; into agricultural implements, 4f.; forged into ornaments, 45f.; converted into needles, 75f.; into steel buttons, 900 f.; employed as polished steel for decorative purposes, 2,000f.; and made into shirt studs, 6,000f.

Prof. Tunner remarks that it is customary to attribute greater strength to cold rolled iron than to that which has been rolled hot. Although experiment has shown that such is the case with new iron, yet this is of little importance in practical use, because it does not last. The strength of such iron, says Prof. Tunner, decreases gradually with time. This is a question which it would be well to determine by experiment.

Lanterns.

In many respects the principles involved in the old grater lanterns are the same as those now applied to lanterns of the present day. The former, it will be remembered, was simply an old tin can, swung from the hand by the aid of a wire or piece of strong twine, and was perforated with many holes to allow the light contained within the can to reach the onter world. The illumination in this case was generally supplied by a piece of candle. The objects to be attained in the use of this lantern were to shield the lamp or candle from the wind and weather, and allow the light to escape trom its shield. We have abandoned the tallow candle, and for it have substituted the kerosene lamp. We have endeavored to supply the place of the perforation of the can by the use of glass, and thus to accomplish the double purpose of protecting the flame and of allowing its rays to pass out of the shield. We have substituted brass or nickel plate for tin, or have used the latter article in a more highly finished state; but, after all, but few essential principles are employed in the construction of the modern lantern that may be called new.

Davy's "Miner's" lamp, although very old, is nevertheless a novelty, because its use during the last sixty years has never been superseded and scarcely amended. In this lamp it is generally known that the globe or chimney is either wholly or partly composed of a wire net work, which may become red hot, but nevertheless constitutes an impassable barrier to the flame within the lantern, and thus may he burned with safety in the midst of combustible gas.—*Iron Age.*

Restoration of Burnt Steel.—On the destruction, not long ago by fire, of the house of a popular officer of high rank, several swords, valued not only for their workmanship and temper, but for the circumstances under which the owner had become possessed of them, had been reduced to the condition apparently of twisted pieces of hoop iron. They were sent to Birmingham, and some time afterward returned in a condition "differing but little from what they had been before their fiery ordeal." Supplementing this statement, Messrs. Wilkinson, the sword manufacturers in Pall Mall, say that it is often of great importance that the onter scale left by the fire should not he removed, nor any attempt at cleaning the surfaces be made unless by experienced hands. In the case of sword blades especially, they find that the minutest details of embossed ornament can generally be traced over the outer scale of burnt steel, and may be copied and restored unless obliterated by friction. Inlaid or damascened gold work on steel will stand a very high degree of heat without being destroyed, and the figure of the genuine Damascus blades, being a part of the structure of the metal, can he restored as long as any of the steel remains. —*Iron.*

A new Chinese Composition.—Dr. Scherzer, an Austrian official at Pekin, has sent to his government some specimens of a Chinese composition called "Schioicao," which has the property of making wood and other substances perfectly water-tight. He says that he has seen in Pekin chests which have been to St. Petersburg and had come back uninjured, and that the Chinese use the composition also for covering straw baskets, which are afterward employed for carrying oil long distances. Card board, when covered with the composition, becomes as hard as wood, and most wooden buildings in Pekin have a coating of it. It consists of three parts ot blood, deprived of its fibrin, four of lime and a little alum.

Hock's Petroleum Motor.—In the imperial printing office at Vienna, three presses of a capacity of 1,200 sheets per hour are driven by a motor invented by Hock, which it is said promises to be very usetul for small industrial establishments. Combustion of petrolenm in the working cylinder, and the heat developed by it, constitute the motive power. The machine is said to be very regular in action, to be entirely free from danger, to require little attention, to occnpy little space, and to be very economical in running, one and a half pounds of petroleum per honr being reckoned for one-horse power. Like the gas engine, it is also ready at all times, and it is easily cooled down.

Journal Bearings.—Dr. C. Knnzel, the inventor of phosphorus bronze, expresses the opinion that a good metal for bearings onght not to be homogeneous, bnt should consist of two alloys of different hardness. The harder of these should be a porous mass which forms, to a certain extent, the skeleton of the whole, and its pores or cells should be filled with a softer alloy. After a series of experiments Dr. Kunzel has taken an English patent for the following alloy: One-fonrth to two parts phoaphorus, 4 to 15 parts lead, 4 to 15 tin, 8 to 15 parts zinc, and copper up to 100 parts.

New Pumping Apparatus.—Messrs. John Jones & Sons, of the Old Buffery Colliery and Furnaces, Dudley, England, have lately put down a powerful pumping apparatus, the engine of which does a vast amount of work with a minimum of power. It is called a "bull" engine, is of 80 horse power, and was made by Messrs. Lee, of Patricroft, near Manchester. The cylinder is 30 inches in diameter, with a working barrel of 12 inches to the lift and an eight-foot stroke. With one boiler 30 feet by five and a half feet, this engine raises 1,250 tons of water per day.

Weekly Variations in Stocks.

Mining Stocks.

The mining share market has heen in a state of excitement for the past few dsys. An advance along the line occurred, everything going up higher thsn it was for some time past. The fluctuations of the market will he seen hy referring to our stock tahles in another column. This rise has heen long and auxiously looked for hy brokers, who will now reap their harvest. As regards the situation in the mines, it still remains favorahle everywhere aloug the line of the Comstock. In that direction, according to the *Enterprise*, there is nothing to cause a panic, or even the slightést nneasiness. From the lower levels of several of our leading mines—where work has for a long time heen in a great measure suspended, on account of had and heated air—we may expect soon to hear good reports, as the works for their proper ventilation are fast approaching completion. In mines where drifts have heen running for months in lines parallel with the vein, only touching here and there its protuherances and sinnosities, preparations for crosscutting are heing made; indeed, in a few instances cross drifts have already heen commenced. The ore hodies already developed expand and improve the work of their exploration progresses and in many instances these have proved to he deposits of undouhted permanence. Good work is everywhere heing done hy those of our companies engsged in prospecting. It is true they have their occasional mishaps and that they at times encounter unlooked-for obstacles, as great floods of water, very hard rock or had, swelling ground, hut hy the exercise of patience, perseverance and skillful engineering all difficulties are eventually overcome.

THE Stevens mine, or West Argentine, Colorado, has heen sold to Chas. Menderhall, of Cincinnati, for $37,000 in cash.

Mining Accidents.

Two men, Eugene Clifford and James Ryan, were seriously injured hy a pecnliar accident recently in the Cerro Benito mines. The Hollister *Enterprise* says they were engaged in sinking an air shaft to connect with one of the tunnels, and had got down a depth of 35 feet when the point of the pick in the hands of Clifford struck into an old charge of powder, exploding it and hurning the men frightfully. Ryan, who was standing off at a little distanoe, had his hands and face hnrned—the left hand hadly. His companion fared mnch worse, as he was standing immediately over the flame. His body, face and arms were shockingly hurned, yet it is thought he will recover. This old blast, it seems, was dropped down into a crevice when the men were hasting on a former occasion, and remained intact until struck hy the pick, as alluded to.

On the 10th inst., a miner named John Evans was instantly killed hy falling down the shaft of the Sierra Nevada mine. At the time the accident occurred he was hringing up some timhers from the hottom of the shaft on the cage. It is supposed that the timhers caught against the lagging and rolled about on the csge, knocking him off.

On the 18th inst., a man nsmed Thomas Ripley, mining near Chinese camp, was heing lowered into his shaft when the noose in which he was seated slipped from the hight, precipitating him a distance of 85 feet. He struck on his feet with terrific force, hreaking every hone in the lower portion of his hody aud killing him instantly.

A miner named John Kuareshorough broke his right leg last week by falling into a chnte from the 1,200-ft. level of the Belcher mine.

Charles Shepardson received injuries on the 17th inst. in the Sutro tunuel, from which he died two days after. The deceased was carman in the tunnel. The cars hold ahout three tons of rock each, and are hauled out of the tnnnel in small trains hy a mule. It seems that Shepardson had brought out a train of losded cars, three of which he pushed out upon a track resting upon a trestlework intended to support the weight of empty cars only. He got hetween two of the cars for the purpose of dumping one of them. While he was lifting on the car the track suddenly gave way nnder his feet. As he fell he was csught hetween two cars and crushed across the hreast.

On Saturday morning as a three-decker oage, containing loaded oars, was heing hoisted up the north compartment of the Consolidated Virginia shaft, the cable suddenly parted at the top of the gallows frame. The *Enterprise* says tbat the cage, whioh had almost reached the 1,300-ft. level, fell hut ahout four or five inches, when it was caught and held suspended in the shaft. The cahle descended the shaft with a noise which resounded through the miue like crashes of thunder. The miners state that the friction of the falling cahle caused bright flashes of fire to stream from the sides of the shaft, as they could plainly see wherever it passed the stations at the several levels. Luckily no one was hurt hy the accident.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Offics, San Francisco:

COQUILLE BLACK SAND GOLD MINING CO.—Sept. 7. Location: Coos county, Oregon, or elsewhere. Directors: W. T. Reynolds, Louis Blanding, C. H. Dewsy, John L. Bray and S. P. Taylor. Capital stock, $400,000.

TABOUT MINING CO.—Sept. 8. Location: Tuolumne county, Cal. Directors: A. D. Carpenter, Clinton Gurnes, Ford H. Rogers, Louis Vesaria and George R. Adams. Capital stock, $6,000,000.

CONTRA COSTA COAL MINING CO.—Sept. 12. Location: Contra Costa county, Cal. Directors: H. P. Coon, O. H. Burton, C. C. Webh, J. S. Hutchinson and C. B. Psrrin. Capital stock, $500,000.

SUNDERLAND QUICKSILVER MINING CO. — Sept. 13. Location: San Luis Ohispo county, Cal. Directors: Thomas Sunderland, J. D. Fry, R. F. Morrow, J. F. Lockhart and H. C. Kihhs. Capital stock, $10,000,000, in shares of $100.

PRIETOS MINING CO.—Sept. 13. Location: Los Prietos, Najalayequa district, Santa Barhara county, Cal. Trustees: M. J. McDonald, J. D. Fry, E. L. Sullivan, E. J. Pringle and A. Packard.

ANGLO-MEXICAN SMELTING AND REFINING CO.—Sept. 15. Object: To sreck smelting and refining works in the different States and Territories of Mexico. Directors: Frederick Hiller, Jr., Frederick Hiller, Sen., John A. Peir, Otto F. Gehricke and Samuel Locke. Capital stock, $1,000,000, in shares of $50 each.

ST. HELENA O. AND S. MINING CO.—Sept. 17. Location: State of California. Directors: J. T. Holmes, J. M. Winslow, Paul Ruger, W. R. Stesls and J. A. Conlee.

HURON CONSOLIDATEN SILVER MINING CO.—Sept. 18. Location: Highland mining district, Lincoln county, Nevada. Directors: H. C. Patridge, Timothy Sargent, S. D. Simons, J. A. Alhertson, Peter McCannon, Peter Harrison and F. W. Clcete. Capital stock, $5,000,000, in shares of $100 each.

PLUMAS CONSOLIDATED GOLD MINING CO.—Sept. 18. Location: Plumas county, Cal. Directors, Maurice Dore, John D. Fry, James R. Garnis, Chas. N. Felton and Robert F. Morrow. Capital stock, $5,000,000, in shares of $100 each.

MANSFIELD DITCH HYDRAULIC MINING CO.—Sept. 19. Location: El Dorado county. Directors: George M. Pluney, John O. Hanscom, J. E. de la Montanya, D. Dickerson, Jr., and A. D. Allen. Capital stock, $3,000,000.

EXCELSIOR QUICKSILVER MINING CO.—Sept. 19. Location: Guerneville district, Sonoma, Cal. Directors: C. E. Allen, Thomas R. Hayes, Henry T. Wheeler, Charles D. Morrison and Wm. P. Morgan. Capital stock, $500,000.

AGRA MOUNTAIN TUNNEL AND MINING CO.—Sept. 22. Location: Agra Mountain mine, in ths Agra mountain district, El Dorado county, Cal. Directors: ISAAC Tahor, J. H. Harmon, E. C. Boobar, A. C. Hendley and N. B. Hitchcock. Capital stock, $2,000,000.

SCOTT QUICKSILVER MINING CO.—Sept. 22. Location: Santa Inez valley, Santa Barbara county, Cal. Directors: George Roherts, R. R. Craig, C. B. Buckinham, Walter M. Rockwell and A. L. Warner. Capital stock, $3,00C,000.

SANTA INEZ QUICKSILVER MINING CO.—Sept. 22. Location: Santa Inez valley, Santa Barbara county, Cal. Directors: Solomon Heydenfeldt, Jesse S. Hall, Harvey S. Brown, W. H. High and Joseph Craig. Capital stock, $3,000,000.

NIAGARA GOLD AND SILVER MINING CO.—Sept. 23. Location: Gold Hill district, Nevada. Directors: James A. Pritchard, W. T. O'Neale, W. L. Brackett, J. J. Hoimes and W. F. Hals. Capital stock, $6,000,000.

Ths following named companies have filed certificates of incorporation in the office of the Secretary of Stats at Sacramento:

SAN JOSE MINING, WELL AND DITCH CO.—Capital stock, $50,000, in shares of $50 each.

REDMAN MINING CO.—Location: San Diego county. Capital stock, $3,000,000. in shares of $100.

EAST BRANCH MINING CO.—Capital stock, $500,000, in shares of $25 sach.

Ths following named company has filed a certificate of incorporation at Portland, Oregon:

OREGON CENTRAL PACIFIC RAILROAD CO.—Directors: B. J. Pengra, B. Goldsmith, William H. Watkins and Ed. Quackenbush. They propose to construct a railway from Winnemucca to the Columhia river, via Goose Lake valley, Sprague River valley, to the middle fork of the Willamette, down the north side of the river to Springville, Lane county, thence on the west side of ths river to Portland, thencs to Columhia river. Capital stock, $7,500,000.

THE *Guardian* says that despite the rumors to the contrary, the diggings at Omineca are likely to prove not only good, hut lasting. There will he quite a number of miners returning to that section next spring, and hy the investment of a little capital in ditches, a very large amount of gold will be taken out.

A PARTY of men engaged in hlssting rooks to improve the channel of the Little Truckee river, four miles above Bocs, discovered a coal vein Fridsy. The vein is about 18 inches thick, and the ooal has been tested and hurned freely.

THE Calistoga *Free Press* announces that the interest in the quicksilver mines and in the silver ledges in the vicinity of the Calistoga silver mine is increasing.

A LARGE portion of the railroad sheds hetween Truckee and Emigrant Gap will have to he rebuilt hefore another season.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

IDLE.—*Miner*, Sept. 19th: With the exception of the Monitor and Northwestern the mines in our county are mainly idle. That company's mill has been running all the week, with what particular results has not transpired.

THE Silver Glance shaft continues to produce ore of a fine quality, and runs a full force of men.

RUBY QUARTZ.—*Chronicle*, Sept. 19: The Acacia contractors struck fine ruby quartz in the tunnel, but whether it is a feeder or the main ledge is to be determined. When struck it showed a depth of 6 in.

THE additional machinery at the Exchequer will soon be in running order to allow the sinking of the shaft to the 200-ft. level, where an extensive body of rich ore will be developed.

SILVER CLOUD.—The shaft is now nearly 90 ft. deep, and when down 100 ft. a drift will be started for the ledge.

AMADOR COUNTY.

MINES.—*Ledger*, Sept. 16: Reports from the quartz mines in the county continue very favorable. Work is progressing steadily in the State of Maine mine, with very fair prospects of speedy development into a valuable mine. The Kennedy is taking out good rock from the last sinking, and the ledge looking remarkably well. The Oneida is producing excellent rock, and the prospects of the mine were never more flattering. The developed mines at Sutter creek and Amador City are returning to their owners their usual large monthly yield of gold, which we doubt not is satisfactory to all parties interested. The Phœnix holds its position as one of the most valuable mines in the county. At Fiddleton, the Valparaiso, as work progresses, gives every indication of a really valuable mine. From our knowledge of this mine, when it shall be fully developed, we feel assured it will take rank amongst the best paying mines in the county. At Quartz hill, work is steadily progressing on the Gold mountain, Golden Crown and White mountain claims, and we are pleased to learn the rock in each presents most encouraging proofs of the value of these claims.

COLUSA COUNTY.

FURNACE COMPLETED.—*Sun*, Sept. 19: The furnace at the iron mine was fired up last Tuesday. It will require a week or more to get it sufficiently seasoned to fill with ore. Then it will be filled about half full of stones in which there is no quicksilver. After burning this for a few days it will be filled with a poor grade of ore. All the condensers will have to get coated with soot in which there will be more or less quicksilver, before the full amount will be taken out. There will always be several pounds of quicksilver in the soot.

ELGIN MINE.—*Independent*, Sept. 18: This mine continues to make rich strikes, and is fast ascending the scale of mines. Some time ago a report was circulated that it was so hot in the neighborhood of the mine that the miners could not work—and this without the busy tongues ever taking pains to visit the mine. Those who own the mine have not been frightened out yet. They still keep on working without any knowledge of the excessive heat complained of on the outside. The Elgin mine has paid expenses from the start, and for the past five months something more. The top dirt and rock pays to retort, for the reason that it requires very little labor to bring it where required. They have now struck the ledge, and there is one grand chimney of cinnabar looming up and all the miners have to do is pick it out and realize from 10 to 25 per cent. even without sorting. One batch run out 72 lbs. of silver—that is the largest that ever was run in this vicinity. From 20 to 60 lbs. are run every 24 hours, and only one man is required to get the ore out. They have commenced building a wagon road up to the mine which will be a grand improvement. They will soon have it completed, and then the Elgin mine will be second to none.

EL DORADO COUNTY.

IMPROVEMENTS.—*Republican*, Sept. 17: J. W. Bennett has taken a third in the Dolly Varden lode, at Kelsey, and let a contract to extend the tunnel 100 ft. This mine has a promising look. He has examined the True claim in Big cañon, and thinks from all the indications that it is a good lead, but that the tunnel ought to be run in 200 ft. further and cross-cut.

INYO COUNTY.

THE BORAX WORKS. *Independent*, Sept. 19: Searles & Co., at Borax Lake on the Panamint road, now have eight vats in use, each capable of turning out three-fourths of a ton of merchantable borax every seven days, that being the time required to effect the perfect crystallization of a vat of water from the heating apparatus. Sixteen more vats, making a total of 24, are to be put in as fast as possible. The boiling apparatus is a most complete affair; it consists of a number of large vats or pans all heated by one furnace (fed with sagebrush for fuel), the heat being carried through the water in a series of ramifying pipes or flues, thereby effecting economy in fuel and space. These boilers have a capacity more than sufficient to supply the proposed complement of crystallizing vats.

MARIPOSA COUNTY.

SNYDER.—*Gazette*, Sept. 19: We learn that Messrs. Streeter and Marsh have made arrangements to work the quartz mines near Snyder's known as the Snyder mine. These gentlemen are practical miners, and we doubt not that the mine, under their management, will give a good account of itself.

MENDOCINO COUNTY.

QUICKSILVER.—*Dispatch*, Sept. 10: Edsall and others have recently discovered what promises to be a good quicksilver lodge near the foot of Hull mountain, on the southwest side, and near the road to Round valley.

MERCED COUNTY.

CINNABAR.—*Tribune*, Sept. 19: Mr. E. L. Reed has confidence in our cinnabar mines. He made a purchase this week of two hundred and twenty-two feet in the Quien Sabe, located on Bay View ledge, near Cambria, which, from all appearances will turn out well. Men are at work on this claim now and the prospects are flattering.

NAPA COUNTY.

BIG INDIAN.—Cor. *Reporter*, Sept. 19: This mine, situated two miles from Anderson's Springs and one and a half miles from the famous Kearsage, has a tunnel run in 44 ft., which has struck the lode with flattering prospects. Another tunnel 100 ft. further south was driven into the lode and run through to what appeared to be the foot wall, a frothy substance that did not satisfy the miner at work as being the true wall. He started a drift obliquely, and found a splendid wall, and overlying the same a vein of black ore of surpassing richness, and from ½ to 2 ft. thick.

PROSPECTING FOR COAL.—Thomas Guinean has a party of miners engaged in prospecting for coal in the mountains a few miles from Monticello. A tunnel has been run in 150 ft. upon a vertical seam of coal of n few inches in thickness in sandstone rock. It is of an excellent character, and he has strong hopes that the vein will widen into one of workable breadth.

DISCOVERY.—Vallejo *Chronicle*, Sept. 19: Another silver ledge has been discovered and located in the Calistoga district by J. A. Conlee, from the Utah country. The location is about a mile beyond the Calistoga mine, on the southern slope, and several hundred feet lower down.

NEVADA COUNTY.

COAL.—Truckee *Republican*, Sept. 19: A party of men engaged in blasting rocks to improve the channel of the Little Truckee river, four miles above Boca, discovered a coal vein yesterday. The vein is about 18 in. thick, and the coal has been tested and burns freely.

PITTSBURG.—*Union*, Sept. 23: The rock from the Pittsburg is showing remarkably well in sulphurets and fine gold, and from the prospects had it is believed that more big crushings will be obtained just as soon as the mine is cleared of water.

QUARTZ.—*Tidings*, Sept. 19: A discovery of a very rich quartz ledge has been made on Deer Creek, near the Dikeman dam, four or five miles northwest from Grass Valley. Six pans of quartz gave gold to the value of $106, and two pans subsequently gave $60 worth of gold.

SPLENDID rock coming out of the stopes of the Idaho, where recently it was of low grade though plenty.

THE Home gold mine, located over near the Wyoming and principally owned by Hon. Thos. Findley, of this place, is soon to be worked.

GRAVEL.—*Transcript*, Sept 23: Gravel miners are making ready for winter, and all hope for plenty of rain. Although the fall last year was heavy, yet the season has been short, and water is very scarce in many places.

WE learn that rock which will pay at least $75 per ton is being taken out of the Gold Run mine, and that the rock in the Occidental is looking splendidly, and continues to improve as a greater depth is attained.

PLACER COUNTY.

GOLD RUN.—Cor. *Herald*, Sept. 19: O. S. Kipp, W. H. Hunt, and one or two others have struck a ledge of rock, and from the specimens brought into town, will pay at least $500 to the ton, as near as I can find out, although it is kept a secret. The ledge was first discovered in the vicinity of Cold Spring ranch. It has been traced into and up a small cañon called Silver Jack cañon. Everybody is on the tiptoe of excitement, and all the ground on both sides of the cañon has been duly staked off and claimed.

PLUMAS COUNTY.

ITEMS.—*National*, Sept. 19: $25,000 was the result of the season's run at Gopher Hill, the claim recently sold to the Plumas Ditch Co., by Mr. Haycock. The company may get a few days' run, yet, this fall. Fant & Co., of Light's cañon, shipped seventy ounces of gold for twelve days' run, working three men. A new ledge has been struck by Mr. Majors, on Wolf creek, which prospects well: Parties are prospecting on the old Ellis ledge at Round valley.

SAN BENITO COUNTY.

QUICKSILVER.—*Advance*, Sept. 19: Another mine has been recently discovered on what is known as Chalmer's ranch, about 17 miles south of Tres Pinos. J. F. Johnson returned reporting very promising prospects, and a number of practical miners were at once dispatched to work on the mine.

SAN DIEGO COUNTY.

BANNER DISTRICT.—Cor. *World*, Sept. 19; The Chariot Mill is turning out $30,000 worth of bullion per month; the Ready Relief company are erecting a 10-stamp mill and as soon as they get it running it will turn out $30,000 a month more. The Pioneer Mill will soon be refitted and remodeled or charged into a camshaft mill, and the Redman mine will soon be reopened from which we have no doubt a firm yield of bullion which will yield $16,000 more, making $95,000 the yield of bullion per month. The Kentuck mine has a fine body of ore in it, but the company are not hoisting out of the shaft as there is no custom mill here where they can get it crushed, and other mines are similarly situated. We may put the estimate for the yield of bullion for the next year at $1,000,000.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Sept. 17: Daily yield, 300 tons of ore. The ore breasts on the 1,200, 1,300 and 1,400-ft. levels are working splendidly and yielding the usual amount of rich milling ore. The mine is gradually cooling off since the air connection with the Gould & Curry on the 1,500-ft. level, and will soon be as comfortable a mine to work as any on the line of the Comstock. Work is steadily progressing on the new mill, which is approaching completion as fast as it is possible to place the ponderous machinery in place.

OPHIR.—Daily yield, 50 tons of ore. The ore breasts both north and south on the 1,465-ft. level are opening stronger and yielding ore of a richer quality every day. In the openings in both the north and south winzes from the 1,300-ft. level the ore is of a fine quality. During the past week the east cross-cut from the south drift on the 1,465-ft. level encountered a fine body of rich ore, causing the stock to jump from $22 to $30 per share. The ore found in this drift is very rich, but of what extent cannot yet be known. It is a discovery, however, of great importance, lying, as it does, 156 ft. east of the other ore bodies now being worked on that level. The Empire State mill is kept steadily running on ore from the mine.

SIERRA NEVADA.—Sinking the new shaft is progressing at the rate of 2½ ft. per day, the rock in the bottom working finely. The hoisting and pumping machinery is all working with the utmost perfection, and much better progress with the sinking is expected from this time forward. The ore breasts in the old upper workings of the mines are yielding 65 tons of good milling ore per day, keeping the company's mill steadily running, crushing ore from the mine.

DAYTON.—Daily yield, 60 tons of ore. This ore is extracted from the ore breasts on the second and third station levels. The ore breast in the north drift at the 2d station level is looking finely, while those both north and south on the third station level are looking splendidly.

WOODVILLE.—The ore body on the 200-ft. level continues of a good quality, and is growing stronger as the ore breasts are extended. The winze from the 200-ft. level has made connection with the north drift on the 300-ft. level, securing a fine circulation of good air, and greatly facilitating the work on both levels. The ore vein on the 300-ft. level is from seven to 10 ft. in width, and gives average assays of from $90 to $125 per ton. A winze has been commenced on the 300-ft. level which will be immediately sunk to the 400-ft. level. The new amalgamating pans have all been put in place, the retorting and assaying apparatus is completed, and a clean-up at the mill will probably be made in a very short time.

GOULD & CURRY.—No work is being done at present on the 1,700-ft. level on account of water. Connecting the north drift on the 1,500-ft, level with the Virginia Cons. has cooled that level so as to make work in that portion of the mine quite comfortable. It has, however, caused a strong swelling of the ground necessitating the entire retimbering of the drift which is now being done. The prospecting drifts on the fourth station level have developed fine, large bodies of solid quartz, but no ore that will pay for extracting.

BALTIMORE CONS.—In consequence of the breakage of some of the air machinery, but little progress has been made with the sinking of the shaft during the past week. The north drift on the 450-ft. level has shown considerable improvement during the past week.

IOWA.—Last Monday work was resumed in the old Iowa tunnel. This tunnel is already in 130 ft., and will cut the ledge several hundred feet below the surface. Cleaning out and repairing the drift is making good progress.

BELCHER.—The new air shaft has been connected below the 800-ft level with the 900-ft. level which now begins to give a good, strong ventilation to the lower levels. Sinking the main incline will be resumed about the middle of next week. Prospecting drifts are shortly to be started for the purpose of cross-cutting and prospecting the 1,500-ft level. The main south drift from the main incline, running toward the Seg. Belcher ground, will shortly be started up. The ore breasts throughout the entire mine are looking well and yielding splendidly. Daily yield, 550 tons of ore.

DARDANELLES.—New shaft down 95 ft. and sinking deeper at a good rate of progress, the ground working very favorably. Preparations are being made to remove the excellent steam hoisting machinery from the old shaft of the company to the new shaft.

CALEDONIA.—Sinking the main shaft is making steady progress, the rock in the bottom working somewhat harder than for some time past. It is now down 20 ft. below the 1,000-ft. level. The prospecting drifts on the 700 and 800-ft. levels are still driven vigorously ahead, without change of interest to relate.

BULLION.—The north drift on the 1,700-ft. level of the Imperial shaft is still driven vigorously ahead, following the foot wall of the ledge, cutting occasional bunches of low-grade ore. The formation of the ledge, so far as developed on that level, shows a great improvement over what it was on the levels above.

HALE & NORCROSS.—The main incline is down 130 ft. below the 2,000-ft. level, the bottom in good sinking ground. The north drift, on the 2,000-ft. level, has made connection with the south drift from the Savage, on the same level, cooling off the level and greatly benefitting the prospecting operations on the 2,000-ft. level.

GLOBE CONSOLIDATED.—The face of the main west drift on the 400-ft. level is almost entirely in quartz of fine character. There seems no doubt but that the main ore vein on this level will now soon be reached. The flow of water from the face of the drift is quite considerable, but does not impede the progress of the work. The face of the north drift from the winze, at the head of the incline, is in fine ore which appears to be widening out as the drift progresses to the northward.

IMPERIAL-EMPIRE.—Sinking the winze below the 1,850-ft. level has been discontinued for the present, on account of water and bad air. The bottom of the winze is still in rich ore. The ore body struck last week in the south drift on the 1,850-ft. level, still continues of a fine quality as the drift follows it to the southward. The main east drift, on the 2,000-ft. level, is making fine progress, the rock in the face working quite soft.

CALIFORNIA.—Both of the north drifts on the 1,400 and 1,500-ft. levels, from the Virginia Consolidated shaft, are making fine progress. These drifts are running to connect with drifts now being driven southward on the same levels from the Ophir. The connections will be made and both levels thus thoroughly ventilated in about four weeks further time.

LEO.—The north drift is making good headway, and the ledge continues large and well-defined, still carrying very good ore. The north stope is looking and yielding well, the ledge being from 4 to 5 ft. wide. The south stope is affording a good quantity of excellent ore; ledge from 6 to 8 ft. thick. About 200 tons are ready for milling.

ORIGINAL GOLD HILL.—The drift west at the 340-ft. level is to-day in 81 ft. from the shaft, all the way in vein matter, and showing indications at present of approaching the ore vein. At the 176-ft. level a drift is also being run for the ledge, which is in 60 ft., also in vein matter.

DANEY.—The face of the main west drift on the 400-ft. level is almost entirely in solid quartz of a very flattering character. There is every indication that the main ore vein will be reached in a very few days. There is a steady flow of water from the face of the drift, which does not at all impede the progress of the work.

SUTRO.—During the past week the main west tunnel has been steadily driven ahead through very promising ledge matter. Considerable quartz is found mixed with clay. The running is quite easy and good progress is being made.

UNION CONS.—The east cross-cut from the main north drift on the 1,300-ft. level of the Ophir, is still driven vigorously ahead, the face in clay and porphyry mixed.

SAVAGE.—Sinking the main incline is steadily progressing, without any change of consequence in the character of the rock penetrated. Sinking the south winze below the 2,000-ft. level is making favorable headway. Prospecting on the 2,000-ft level is still prosecuted without change of value to report.

YELLOW JACKET.—Sinking the south winze below the 1,540-ft. level is making steady progress. The main west drift on the 1,740-ft. level is in 189 ft., the rock in the face working quite soft. There is no change to report of the other prospecting operation in the different portions of the mine.

NEW YORK.—The main shaft is down 47 ft. below the 560-ft. level in soft sinking ground.

CROWN POINT.—Sinking the main incline is making good progress. The main south drift is still driven vigorously ahead, without change of interest to report. The ore body on the 1,500-ft. level is opening up finely, and already promises a good yield of rich ore. The ore breasts on the 1,300 and 1,400-ft. levels are both looking well and yielding splendidly. The ore body on the 1,000-ft. level is showing improvement as it is worked to the northward. Daily yield, 500 tons of ore.

UTAH.—Prospecting the 400-ft. level is still vigorously prosecuted, without any new discoveries or changes to record. The water in the shaft, although under good control, is not yet sufficiently drained to allow of a resumption of the work of sinking the shaft.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the assay value of which is $30 per ton. There is no change to report of the prospecting operations at the fifth station level. The ore breasts on the old upper levels are all looking well and yielding the usual amount of good ore.

SUTRO TUNNEL.—The total length of the main tunnel is now 6,862 ft. Soft ground has been encountered during the past week, which has retarded tunneling operations somewhat, it being necessary to keep timbers close up to the face of the header. Since last report, the tunnel has been advanced 65 ft.

Diamond Cutting.

The *British Trade Journal* publishes the following interesting account of the menner in which diamonds are cut and polished: The art of a diamond cutter is not easily acquired; and the monopoly of it which the Dutch heve until quite lately enjoyed is really not astonishing; and there is no telling how long they might have kept it to themselvee had not jealousies recently sprung up between the employers and the journeymen, which induced some of the latter to settle in London and to pursue their avocation there. These Dutchmen have prospered in the metropolis, but the eyes of Birmingham have been upon them, and henceforth they will have to contend with some native opposition. Mr. Spencer hes at length, after a long time spent iu maturing his plans, succeeded in obtaining the requisite experience and machinery, and, moreover, he has obtained men who are able to successfully accomplish the delicete work required. Diemonds, when fonnd by the diggers, are most pecnliar in shape, the majority of them appeering to have been submitted to the operation of cutting, and afterwerd to have hsen squeezed or compressed, so that the regulerity of the fecets which they bear has been pertially destroyed. Others eppear to have been in a state of fusion, and to have "set" in most fenteatic shspes. All, or nearly all, bear flaws of some kind, and the preliminary operation is to remove these defecte. Having ascertained which way the "grain" of the stone runs—for diamonds have grain, like wood, although it is not quite so readily discovered—it is firmly fixed iu a very hard cement, with the flaws uppermost. Teking a diamond with a sharp edge—which is also set in cement contained in a cup with a long handle—the operator proceeds to "sew" a small trench in the rough diemond, just beneath the flew, teking the utmost care to catch the dnst produced by the sawing process in a smell box, as it is valueble for polishing diamonds and other purposes.

When the trench is cut to a slight depth, the workmau inserts the blade of a sharp instrument, and on thie being tapped sharply, the diamond splits, generelly with marvelous precision, and the defective part of the diamond is thus removed. Some stones, however, cannot be thus dealt with, in consequence of the grain not running smoothly. Any attempt to split them would surely destroy the greater part of their beauty, end they are therefore cut with a very finely tempered sew, sprinkled with plsnty of diamond dust, moistened with olive oil. Supposing the diemond to have been freed from all flaws and blemishes, it now requires cutting. The cutter mnst necessarily be a man of great judgment and teste, for he has to decide, on inspecting the rough stone, in what form it shall he cut, so as most effectively to display its brilliance and beauty, and at the same time to preserve as much as possible of its weight. The workman having decided whether the diemond shall form a rose or a brilliant, proceeds to cut it eccordingly. To his taste, also, is left the decision es to whether the stone shall have 20, 24, or more faces. To cut these facets, he fixes the diemond in cement, and proceeds, with another diemond of about equal size, to rub away the surface of the stone, until a perfectly flst surface of the size required ie formed. A skillful workmen will so manipulete the diamond, that he will cut facets on the stone *on* which, and on the one *with* which he is operating, simultaneously. Of course, the dust and small chips formed in this process are also carefully preserved. One fecet having been formed, the stone is turned in the cement and second facect is cut iu a similer manner. Such is the marvelous skill attained by the workman, thet he will cut the whole 20 or 24 facts of exactly similer size—or, at least, so nearly of a size that a microsoope only would reveal any discrepency. Having thus, with greet care and nicety, brought the diamond to the shepe required, the facets, which are of neoessity rather rough, have to be polished. This operation requires scarcely less skill than that of cutting. The polishing wheel is a circular teble of iron, known by the Dutch name of "Schuff." By means of machinery it is made to revolve with extreme rapidity, sometimes at the rete of neerly 3,000 revolutions per minute. On the surface of this iron table is placed a quantity of very fine diamond powder, moistened with olive oil. Before the diamonds are polished they are set in a cone composed of an alloy of lead and tin, and this cone exactly fits in a cup, which is held stesdy by a long handle fixed in the wall of the room, or some convenient post. The facet of the diamond, which forms the summit of the cone, is then pressed on the revolving table and held down by weights of lead. Of course, the weights vary, some stonee requiring two pounds pressure, and others as much as 30 lbs. The workman who euperintends the operation has to exercise the most extreme cauttiou, for should the diamond become loose in the cone, ii wonld, in all probability, be much damaged by the edge of the facet being grouud away. One fecet having been properly polished, the stone is taken from the cons, and refitted with another facet nppermost, and the same operation ie repeated. It will be seen that the polishing of a diamond thns occupies a considerable time; and, as it occasionally heppens that a gem may be softer in one part than in another, the workman requires to be constantly on the alert to regulate the pressure on the etone and the revolutions of the table. When it is also borne in mind that some of the diamonds cut and polished in thie manner are smaller than the head of a pin, and that perhaps they have to be cut with twenty-four facets, the extreme delicecy of the operation will he at once apparent.

Lac.

Lac is a resinoue substance formed on severel different kind of trees in the East Indies, snd produced by the punctures of an insect (*coccus lacca*), and by its formation of the exuding jnices into celle for its eggs.

These adhere to the branches in grains, completely encrusting them, and are either imported in that form, end called stick-lac, or the grains are gathered from the branches, their coloring mattsr extrected and formed into flet cskes, still preserving the granular appsarance, and called seed-lac, or the seed-lac is melted up into masses and called lump-lac. Finally there is shell-lac, which is seed-lac further purified by heing put into hags of fine linen, and melted over a charcoal fire until it passes through them. The bags are squeezed and passed over a smooth surface of wood, on which the lack is deposited in thin leyers. If pure, this kiud of lac will take fire on a hot iron, and burn with a powerful smell.

By pouring warm weter on stick-lac a crimson coloring matter is obtained, whioh is made into square cakes for ssle, and called lac-dye, lac-lake or ceke-lake. These cakes when broksn are dark-colored, shining and compect, hut when scraped they yield a bright red powder approaching oarmine. The cskes of lac-dye from Indie are stamped with certain marks, the best being D. T., the second best J. McR., the third C. E., which are the initials of different menufacturere. The cakes do not in general contain more than 50 per cent. of coloring metter, the rest being resin 25, and alumina, plaster, chelk and sand 25.

The dye above referred to, and which constitutes much of the velue of lec, is due to the insect which makes the cells, and which is of the seme family as the cochineal insect. The parent lac insect, after leying her eggs, becomes e mere lifeless hag of an ovsl ehape, containing a small quantity of a beautiful red liquid. The youug insects feed on this liquid, and their hodies assume the sems hue, so that the branch which bears them appesrs to be covered with red powder. The cells of gum-lac which shelter them are more or less deeply tinged with the same color, end the best time for gathering stick-lac, so as to secure the coloring matter, is before the insects have made their escape. Previous to the discovery of the true cochiusal, the coloring matter of the lec insect was universally employed for dyeing red. The crimson of Greece and Rome, and the imperishable reds of the Brussels and Flemish schools were obtained from this sonrce. The best quality of stick-lec is obtained from Siam, that of Assam ranking next. Of late years lec-dye has egain been substituted for cochineal on account of its greater cheapness, and also on account of its being less affected by perspiration than cochineal.

So abundant is the supply of leo among the cultivated mountains of Indie, that it is asserted consumption ten times greater then the present might he readily met.—*Cabinet Maker.*

All About Coffee.

In the followiug we find some very useful hints on coffee. Only one thing we will add: Never uae "ground, browned or prepered coffee," for there is room for decsption that ought not to be risked.

Jave coffee has a large, full yellow berry, but thet of the Rio is emaller and of a greenish tinge. The difference in essential properties is dorived from the difference in climate, thst of Java retaining the bsan to ripen moie perfectly than it is left to do in Brazil, where it is reised chiefly by unskilled slave lebor. The best coffee for farmers is made by mixing the two—Java affords the most fragrence, and Rio the most stimnlant and proteotion against chilliness and damps. Very much depends upon the perching of coffee. This should be done slowly at first to expel ell the moisture, and repidly at last, stirring it constsntly so that it will be browned, and not burned in the least. When it has an oily eppearance, and is of a light brown color, it should he removed at once from the fire and put in a close vessel.

We have tried a great many ways of making coffee pots; hut for family use we have never found anything better than a good block tin pot, and the white of an egg to cleanse the beverage. We grind two tablespoonfuls to a person, put it into the pot, add the white of an egg and sufficient cold water to moieten the whole; stir it together and let it warm on the stove, and then pour on hoiliug water and let it boil two or three minutes only, unlese those who drink it have been exposed to cold or damp, or are anticipating euch expoeure. In that case it should remain over the fire fifteen or tweuty minutes, long enough to extract eome of the bitter principle, which is of the neture of quinine in its effects on the system.

Coffee grounds should never be allowed to remain in tin, but should be poured out and the pot carefully cleaned as soon as it ie used, else the flavor of the next beverage prepared in it will be impaired. Soft water is very much preferable to hard for making coffee, ee the mineral salts in the latter often oombine unpleasantly with the constituents of coffee, and give it an acrid taste. There is no good reason why our tables should be so frequently disgraced with muddy, bitter, roily coffee, when a little care and skill can furnish a beverage aromatio, exhilarating and delightful.—*Ex.*

Catgut.

The manufacture of the striug popularly known as catgut, and of so much importance with the users of strinqed instruments, is an invention dating beck to pre-historic times. The earliest record speaks of cords made from the intestines of various animals and used in the construction of hows and other warlike implements. Prepared intestines are also mentioned hy Josephus, as heiug used in the construction of catapultic engiues which were intended for throwing stoues as well as darts and errows, these having been invented by Dionysius, the tyrent of Syrecuse, 399 B. C. In the construction of' musicsl inatruments these strings were used by the nations of the East at a period earlier than euthentic history began.

The manner of preparation wes originelly very imperfect, the strings being subject to decay and the destructive attecke of vermin. Catgut is now generally prepared from the intestines of the sheep and goat; rerely from those of the horse, ass or mule, and never from those of the cet, as one would naturally suppose from the name. The first stege in the process of manufecture is the thorough cleansing of the entreils by means of a blunt knife or scraper, which in the hands of eu expert workman is an operation requiring very little time. The intestines ere then steeped in weter for severel days, or uutil the externel membrane becomes sufficiently loosened to allow of its ready removel by scraping. The materiel which is thus screped off is employed for the cords of battledoors and rackets, and also ee thresd in sewing the ends of intestines together. The scraped intestines are then steeped in water and scraped again, when the larger are cut and pleced in tubs with selt to preserve them for the sausagemaker; the tormer are allowed to steep in pure water, and are then treatod with a dilute solution of alkali, usuelly a compound of one ounce eech of potesh end carhonete of potash to a gallon of water, with occasionelly tho addition of a little alum. After remaining in this bath a sufficient length of time—which varies with the different establishments, snd on which the quality is said pertly to depend—the intestines are drawn through a perforeted brass thimble and assorted in their respective sizes, when, after drying, their manufacture is considered completed. In order to destroy any auimal matter that may still adhere and escaped the successive scrapings and washings, and which would lead to putrefection, it is customery to subject the catgnt to the fumes of burning sulphur—sulphurous roid—which acts es an antiseptic aud arrests decomposition.

The best catgut strings are those known as Romen, which are made in Italy from the intestines of sheep aud goats. These are the strongest made, and mostly used for musical instruments, and are remarkable for their clearness and transparency. The cords used by clock-makers ere made from the smallest of the intestines and from lerger ones which have been split longitudinally into several lengths, which lengths are then sewed together with thread made from the external membrane scraped off during the process of manufacture as described above. Whip cord is mede from catgut which has bsen twisted in a mennsr somewhat similar to thet employed in the manufacture of single-corded ropes. The catgut obteined from the intestines of horses, asses aud mules is principally mede in France, and is employed in many eases instead of leether helts for driving mschinery.

The country from which probably three-quarters of the whole amount consumed is derived, is Itely, which also furnishes the best, and, as many violiuists assert, the only ones thet are fit to be used for a violin. The best and lsrgest bass viol stringe are mede in Germany, where, also, the greeter part of the guitar strings are mennfactured. Englend and the United States heve no capital employed in this lucrative business, or, if they have, it is very small, and those engaged in it have failed to make themselves known by advertising this fact.—*Mercantile Journal.*

A Curious Formation.—A few deys since the miners working in the lower level of the Silver Lake mine, owned by John B. Winters & Co., made a curious discovery. After taking out the ore in the vein at a certain point, they for some reason took it into their heads to dig into the wall of the lead. After passing through a shell of wall-rock of a few inches in thickness, they made the discovery that there lay behind it several large bowlders of pure argentiferous galena. These were no small affairs to be put into a wheelbarrow and wheeled away, but immenso masses of metal that could hardly be moved by all the men that could gather around them. Some of these bowldere eo curiously tucked away outside of the vein proper would weigh over half a ton. One of them, weighing between eight hundred and one thousand pounde was got out of the miue whole and sound, just as it wae found, and will be brought to this city iu the course of seven or eight days. A short piece of the new wagon road now building to the mine remains to be completed, and as soon as this shall have been finished, eo that wagons may reach the dump, the big metal bowlder will be brought to this city and placed on exhibition somewhere on C street. It will he hauled to Careon on a wagon and from there will come by rail.—*Virginia Enterprise.*

Anhydnous alumina steerate dissolved in turpentine is recommended as a limpid and flexible varnish, and it is said to be unalterable at elevated temperaturee.

Furniture at the Mechanics' Fair.

The furniture manufacturers occupy an extensive spsce in the Pevilion, and their exhibits form one of the most creditable displays at the exhibition. The displsy to-day is in marked contrast with the earlier shows, when the chief portion of the articles were of Eastern make. With the exception of musical instruments, we are not aware of the presence of a single ertiole of furniture or cabinet manufacture on exhibition which is not the work of our own mechanics. This fact speaks volumes in regard to the progress which has been mede on this coast within a few years in this importsnt brauch of industry. Our people are now fully alive to the fact that as good furniture can he mede here as in any part of the world, and that we possess an abundence of lumber for ell purposes connected with this business. There is perhaps no product of the mechenic arts which more fully indicates the social and esthetic state of a people than the taete displayed in the matter of household furniture. The ancient Egyptians, the most refined and advanced people of their ege, devoted much study and great expenss to furnishing their dwellings. While other nations, of pretentions to refinement, employed mats and stools, they nsed chairs in great variety and elegance, formed of ebony and other rare woods, and of ivory inlaid with gold and silver and elegantly upholstered with the most costly tissues. The same may be seid of the Greeks and Romsus. But with the decline of civilizetion these elegancies of household furniture gradnelly disappeared, and for many oenturies domestic furniture wes everywhere very scanty and plain. A bed and chest with benches in the diuing hall and a few rough, nncouth apologies for chairs were the chief appendages of the dwellinge of our Anglo-Norman ancestors.

With the revival of literature snd civilizetion, however, a remarkable improvement in house conveniencea and decoration began to appear. Gothic panelings and appropriate oervings osme into vogue, while scarlet, blue, gold end other costly upholstering and hangings begen to fill the dwellings of the wealthy. Cabinets, reading desks, secreteries, etc., hegan eleo to appear as something new in the line of furniture—euch things having been unknown to the ancients. As civilization continued to progress and improve, e more subdued yet equally rich taste wes developed throughout Europe, taking for its starting point Italy, the earliest sest of European literature and taste. England wee the last of Europeen countries to enter npon such innovations, and long remeined conspicuous for lack of taste in that direotion.

The modern predominance of France in the manufacture of furniture is due to the considerate action of her Prime Minister, Colbert, who, about 1670, brought together from all parts of the continent the best workmen to be fonnd, and esteblished a royel furniture factory at Psris, where new styles were atudied and produced under the direction of the best masters in the world. Novelty and magnificence were the great features simed at, and these were much sought sfter by veried treetment of surfacee, as inlays of metal, ivory, enemels, shells, precious stones, etc. In this direction the femous artist, Boule—the heed of the royal mannfactory—made himself famous, and gave his name to the style still known as Buhlwork, a very elegant set of which wes imported to this city some years since by one of the proprietors of the *Bulletin.*

This style of work became very populer during the last century, and the products of the royal mannfactory were scattered very generally throughout Europe. The finest piece of work of this kind ever gotten up is said to be a secretary, which was constructed at a cost of $17,000. In later years, and especially during and since the French Republic, this style has been less popular, and Greece and Rome have been looked to as steudards, in furniture as well as in polities. This letter innovetion was encouraged by the greet Nepoleon, who, as well ss the late Emperor, devoted much attention to fostering this ancient French industry. Soon after the revolution a more general prevalcuce of mediæval taste became popular, and sharp-pointed Gothic ornamente and construction were not intrequently the cause of tormente to those who sought their rest on fashionable Freuch furniture. This retrograde taste, however, is passing awsy.

If any special style can be considered prevalent at this time in the United Statee, it ie what may be called a modification of thet of Louis Quartorze of France, and the Elizabethau style of England. French is the prevalent style. Our moet costly furniture ie nearly all executed from French designs. Since the finer specimene of mohogany have hecome scarce, the public largely favor rose-wood, obtained chiefly from South America and the West Indies. This, however, has latterly been supplemented by hlack walnut, and more latterly by our own beautiful laurel. The beauty end substantial character of the California laurel has now become so well known and appreciated, that the demand for it muet soon become very general throughout the United States; so much so that ite cnltivation as a forest tree will eoon be demanded to keep up the supply.

In the general manufacture of furniture, France still rnlee the world, and derives therefrom a large national income. Not lese than 40,000 workmen are employed in this business in the city of Paris alone, the annual value of whose products reaches nearly $25,000,000,

Useful Information.

Hints to Painters.

You are generally working in ill-ventilated shops, and handling poisonous pigments the year round, one of the most dangerous of which is white lead; therefore, it is imperatively necessary that you be cleanly in your habits and person. If you eat with unwashed hands, and wear clothing saturated with paint you must expect to absorb large quantities of poison, and suffer in consequence, and perhaps bring on paralysis or kidney disease, which will render you, if not entirely unable to work, so weak and prostrated in mental and physical power as to be but a shadow of your former self, and suffer always from general weakness. Once banish white lead from the shop, and one of our worst enemies will be got rid of, and it is coming to this soon. Different substances have been introduced of late years to take its place, some of which I know from experience to be equal if not superior to lead for carriage-work. Old fogy may poh-poh as much as he likes at such innovations, but these different substances have been used with an encouraging success.

All carriage painters should wash their hands before commencing or resuming work, and should do it as often as possible during the day. They should have a strong decoction of oak bark also to wash in, the tannin of which would not only harden the skin, but would protect it against the action of lead and other poisons. This is where the British coach painters are ahead of us; you will always find plenty of oak bark in their shops. You should also keep your hair cut short, and wear a light cloth or paper cap while at work. Be sure that your hands are well washed before partaking of food. I am very sorry to say it, but the truth must be told sometimes, you often eat your noonday meal with unwashed hands. The mouth should be well rinsed with water before eating food. The body should be sponged as often as possible with cold water, and the hair should be thoroughly washed every day; you will find it better than hair oil. Your food should contain a large proportion of fatty substances; avoid all strong drink; drink milk in large quantities; rest or sleep five or six hours, and my word for it you will have no painter's colic or cross wife.—*Carriage Monthly.*

Flood-proof Bridge.—The rise of water in our streams during the heavy rains in the coming winter months always results in the removal of a number of road bridges of the ordinary plank and timber kind, and as the accident is a frequent and widely extended one, it may be worth while to mention the form of bridge which has stood the test of this and other freshets, when the level bridge has been swept away, a description of which we first noticed in the New York *Tribune*. Let the timbers be laid so that when the planks are spiked on, the side of the bridge *down stream* will be considerably higher than the side up stream; then as the water rises it will strike the upper side first, and, before it can rise high enough to float the bridge, its buoyancy is opposed by its impetus acting upon the inclined plane formed by the bridge's surface, a return current is formed beneath the bridge, and the structure is fixed as firmly as if it were of stone.

Roofing.—Plastic slate roofing does not consist properly of asphaltum and slate flour, as suggested, but is made by uniting in proper proportions coal tar and slate flour, and spreading the mastic on the foundation of the tin or felt, as mortar is spread with a trowel on lathing. Asphaltum, sand, peat, street dust, clay and numerous other substances have been employed to make roofs; but, in numerous instances, the work has utterly failed to produce the desired results. Hence such roofs have come into extreme disrepute in certain localities. By producing the genuine slate flour, rolled finely and free from all sand and dirt, and applying it when of the proper consistency by spreading it on well with a trowel, there is no other roofing material that will subserve the purpose more satisfactorily, as far as economy and durability are concerned. If the materials are good, the plastic will become in a few weeks like real slate, and will then be as durable as that from the Vermont quarries.

Cleansing Bottles, etc.—A good mechanical method is that noted in the Press of last week—using wire clippings. This is not always sufficient. Bottles that have had medicine in them may be cleansed by putting ashes in each, immersing them in cold water, and then heating the water gradually till it boils. After boiling an hour let them remain in the water till it is cold. Wash them in soapsuds, and rinse them till clear in fair water. Pie-plates that have been long used for baking are apt to impart an unpleasant taste on account of the rancidity of the butter and lard imbibed. Put them in a brass kettle with ashes and cold water, and boil them an hour.

Dr. Vogel, of Berlin, in a letter to the Philadelphia *Photographer*, says that old daguerreotypes that have turned yellow, blue or black will often become as bright as new if simply placed in a solution of cyanide of potassium.

Calculating Horse-power.—The rule is to multiply mean effective pressure in pounds during stroke, by piston speed in feet per minute, and divide the product by 33,000.

Shrinking of Seasoned Timber.

The various kinds of oak, and some other kinds of valuable timber, will shrink more or less every time the surface is dressed off even a small fraction of an inch. Wheelwrights accustomed to work in oak are well aware of this fact, and a correct appreciation of it often enables them to turn out work of a superior character, even of ordinary materials, by first blocking out the pieces roughly, then allowing the timber to season, and afterwards working the various parts by degrees, as the seasoning process becomes more and more complete. White-oak spoke timber, for example, may be allowed to remain in the rough state for half a score of years, under shelter, without becoming seasoned so thoroughly that the timber will not shrink after the spokes have been dressed out.

Carriage-wheels have often been made of the choicest quality of oak timber after every spoke had been seasoned for several years, and to the great surprise of the wheelwright, every spoke would work in the joints before the vehicle had run three months. The defect in such instances could not be attributed to inferior timber, nor to perfunctory workmanship; but simply to this one circumstance—that the parts of the wheels were put together before the timber had ceased to shrink.

To prove that the best quality of oak will shrink, after a spoke has been dressed out, let a tenon be made on one end, and be driven immediately into a mortise; after a few days' exposure in a warm workshop, the spoke may be withdrawn with little difficulty. The same fact will hold good in the manufacture of woodwork of any kind where oak is employed for tenons. In order to make joints that will never start, the piece on which the tenons are to be made should be dressed over several times, until the shrinkage has ceased. Then let the tenons be made. After these have shrunk, while, exposed to the drying influences of a warm workshop, the spokes, or other parts, may be driven into their respective places, with the assurance (especially if they are dioped in oil paint previous to driving) that the timber will shrink no more.

Many kinds of farming implements, in the manufacture of which oak and ash are employed, render very unsatisfactory service, simply because the seasoned timber was not allowed to shrink before the tenons were driven into the mortises. In like manner, oak chairs, and other oak furniture, will frequently shrink to such an extent that the pommels, rungs, dowelpins and banisters will all work loose, if the precaution we have described is not observed.—*Am. Homestead.*

Ochre and Umber.—Ochre is a variety of fine clay containing iron. The common colors are yellow and red, the latter being colored by sesquioxide of iron, and the yellow variety by the hydrated sesquioxide. Umber is an ochreous ore of iron, or a brown or blackish-brown color, consisting of oxide of iron, oxide of manganese, silica, alumina and water. They are found principally in Europe, although they are widely distributed. The ocher is found in beds some feet in thickness, which lie generally above the oolite, and are covered by sandstone or quartzose sands, more or less ferruginous, and are accompanied by gray plastic clays, of a yellow or brownish color; all of them substances which contribute more or less to its formation.—*Sc. Am.*

According to a French veterinary surgeon, a simple method of preventing flies from annoying horses consists in painting the inside of the ears, or any other part especially troubled, with a few drops of empyreumatic oil of juniper. It is said that the odor of this substance is unendurable to flies, and that they will keep at a distance from the parts so anointed. If this treatment should accomplish the alleged results, it may, perhaps, be applicable in repelling mosquitoes from the faces and hands of tourists and sportsmen, when passing through woods or meadows.

Sediment in Lake Water.—The following figures are given, as representing the number of grains of solid matter held in suspension and solution in the water of various lakes: Lake Hopatcong, 1.79; Bala lake, Wales, 1.63; Loch Katrine (supplies Glasgow), 1.63; Norwich, Conn., reservoir, 1.84; Cochituate lake, 3.11; Lough valley, Ireland (supplies Dublin), 3.11; Croton lake, 4.78; Geneva lake, Switzerland, 8.87; Lake Ontario, 6.01; Lake Erie, 6.49; Lake Michigan, 6.68.

To Stain Wood.—Take green walnut shucks; boil out the strength and boil the dye down a little. Then, to a gallon of dye add one spoonful of extract of logwood, and one-half teaspoonful of salts of tartar. It will stain wood a bright red. A little aquafortis added will make a dark brown. Make the dye in a large vessel, for the salts make it foam. The shucks must be green.

For a substitute for copper in the Daniells battery procure sheets of the ordinary sheet tin of commerce, brighten and plunge into a very weak copper plating solution, in connection with a voltaic battery of very low quantity. In 15 to 18 hours a tenacious film of copper will have been deposited upon the tin, and the plate can then be bent in shape for a Daniells battery.

Many of the railroads now have in use a valuable lamp, called the "quick signal railroad lamp," which is simply a red light and a white light combined in the same lantern.

Good Health.

Food and Work.

In a recent number the *Journal of Chemistry* explained how "a day's work" is measured in foot-tons, and its average amount, including both the "external" work, or that performed in labor or walking, and the "internal" work, or that done by the organs of circulation, respiration, digestion and other vital processes. The former averages from 300 to 500 foot-tons, the higher figure representing an exceedingly hard day's work. The latter may be reckoned taking the average of the best estimates, at 260 foot-tons. As might be expected, it is difficult to measure this internal work with precision, and the estimates of different physiologists vary widely, those for the heart alone ranging from 122 to 277 foot tons. The former is the amount calculated by Haughton, who puts the respiratory movements at about 11 foot-tons for the 24 hours, while others have set them as high as 44 foot-tons. The exact value is of no importance for our present purpose. Taking the lowest estimate, the internal work is no insignificant addition to the other labor performed by the wonderful mechanism of the body of ours.

Where does all this force come from? What keeps the machine going? The idea of "perpetual motion," or a self-moving machine, is as absurd here as in any other department of mechanics. A steam-engine may as well be expected to run without its boiler and furnace, as the body without its equivalent for boiler and furnace; and both alike must have fuel to keep up their fires. We need not dwell on this point, for the fact that the *food* we eat maintains the heat of the body, builds up and renews its muscular tissues, and nourishes all its varied energies, has been familiarly explained. It has been shown, moreover, that the food is literally *burned* to produce this heat and force, and that the air we breathe supports this combustion, which is a process of oxidation, and dependent on a constant supply of oxygen, precisely like the fire under the boiler of the steam-engine.

Now, we know that it is impossible to calculate just how much work a pound of coal burned in the furnace of an engine is capable of doing. The heat generated in the combustion is equivalent to something more than 11,000,000 foot pounds, and if none of it were wasted it would actually do that amount of work. In the steam engine, however, only about a tenth part of the energy stored up in the fuel is realized as work.

May we not calculate in the same way what work the food we eat, considered as fuel, is capable of doing, and compare this result with the actual amount accomplished by it in the body? The problem is somewhat more complicated than in the case of the steam-engine, but several physiologists have tried their hand at it, and have attained reasonably consistent results.

Dr. Frankland has determined the "mechanical energy" of various kinds of food, both when burnt in oxygen and when consumed in the body. The amount is sometimes smaller in the latter case than in the former, because the combustion is not so complete. For example, an ounce of albumen generates a certain amount of heat when burnt in oxygen; but in the body some of its constituents are only partially oxidized, being excreted in the form of urea. An ounce of sugar, on the other hand, is generally all burnt up into carbonic acid and water, and its actual energy in the body, under whatever form it appears, is equivalent to its theoretical energy.

Disinfectants and Deodorizers.

To deodorize an ill-smelling room or locality intelligently, substances must be used, which, by causing a new chemical combination, destroy the odor altogether; but if the decomposition continues to go on, other odoriferous particles begin to arise requiring a new application of the deodorizer; on this account all deodorizers are efficient only temporarily; hence the only rational method is either to remove the offending material or employ disinfectants which arrest further decay. If the material both arrests the decay and destroys or absorbs the ill-smell, then it is doubly valuable. Two hundred grains of chloride of zinc in an ounce of water is a powerful agent in neutralizing bad smells and in arresting both animal and vegetable decomposition in ships, hospitals, dissecting rooms, cellars, privies and water-closets, without having any ill-smell of its own: for disinfecting purposes, mix one part of the above fluid to four gallons of water.

There are three powerful disinfectants: carbolic acid, but its smell is objectionable; chlorine and permanganate of potash; these disinfectants act by combining with deleterious substances and rendering them harmless, while antiseptics prevent and arrest the decomposition of animal substances.

The only perfect disinfectant is habitual cleanliness and thorough ventilation; next to that is a dry heat of 250 degrees.

The most common and availing disinfectant and deodorizer is copperas, crude copperas, sold by druggists at a few cents a pound under the name of sulphate of iron, one pound to two gallons of water, to be used as often as necessary to render all odors imperceptible, acting at the same time as an antiseptic, deodorizer and disinfectant, and if instantly thrown over what passes from the body in cholera, is one of the cheapest and best means known for preventing its communication to others.—*Ex.*

Imagination Power.

Many persons are sick merely from the effect of imagination or habit, the old woman, for example, who had been bed-ridden for years with her rheumatics. She was left alone one summer day at the farm house with both front and rear doors open. She saw a mad bull tearing across the pasture in the direction of the house, and feeling that it was "neck or nothing" she bounced out of that bed in double quick time, barred both the doors, and never complained of rheumatism afterward.

Many cases are given in the medical journals of persons who have been bitten by dogs, and have afterwards taken to foaming at the mouth, shuddering at the sight of water, and imitating a dog's bark, imagining that these are signs of hydrophobia, and have actually died in convulsive agonies, the facts being that mad dogs don't foam at the mouth, never bark, and can drink water "like a fish." So far from running about in desperation as if a hundred thousand dilapidated tin pans were tied to their caudal prolongation, really mad dogs are the quietest individuals in the world, make no noise, seem to want to be alone, keep their mouths shut, the distinctive symptoms of such madness being great restlessness, pawing the face and eating their own fresh dejections. Mad dogs do not run after people, but will snap at anyone who comes in their way, especially individuals of their own kind; they seem to trot or run as if looking at something straight ahead. Infinite mischief is done in publishing cases of persons becoming hydrophobic one, ten, and even 20 years after the last remembered biting of a dog, the reporters of such tales not having taken pains to inquire if there has not been a later biting. Such monstrous absurdities are well calculated to keep nervous persons, who have been once bitten by a dog, in a state of wearying uneasiness all their lives long afterwards. If a person has been bitten by a dog supposed to be mad, the animal should be put in a quiet room and let alone, only slipping in food and drink from time to time; if really mad death will take place in a day or two, and if not mad there will be a complete recovery.

Only one bite in 20 of dogs supposed to be mad is fatal.

A dog in New Jersey last year bit a woman, and ran under the sofa; her husband dragged him out by the tail, held him up and whipped him; in this position the dog got a chance of biting his master, who died in a few days of hydrophobia; this shows that the state of mind of the animal gives virulence to the bite. A mother nursing her infant child was thrown into a sudden, a tempestuous rage; as soon as it was over, she finished nursing the child, which was at once taken with convulsions; the state of mind of the mother imparting virulence to the milk of her bosom. A lady saw at a distance a window sash falling immediately on the ends of the fingers of her little grandchild; the child's fingers were crushed—those of the grandmother were similarly affected. This is given on the testimony of the distinguished Dr. Brown Sequard. The lesson is, seek to control the imagination and to guard against intense mental excitement by habituating the mind to take a calm, measured and deliberate view of all the circumstances of life. Intelligent people should bear these things in mind. The greatest throat swabber of the age began to think he had sore throat too, and swabbed himself every day; and when he died his throat was found to have been as well as anybody's.

The best way to escape imaginative diseases is to be just as busy as you can in doing something useful, profitable or good; to have the mind fully employed in some commendable object; it is thus that the washerwoman is often happier than the wife of the millionaire; the hod carrier, than he who has "retired from business."—*Hall's Journal of Health.*

Proposed Law Against Quackery in Texas. The committee appointed by the Texas Medical Society to examine the act to regulate the practice of medicine in that State, have presented the following amendment, among others, to be recommended to the legislature: "Any person who is not a citizen of Texas, entitled to vote, who shall come into the State and advertise to perform surgical operations, or cure diseases, shall, before entering upon such practice, pay into the county treasury the same tax as is paid by persons exhibiting a circus performance or menagerie, and, for violating this act, parties guilty of the same shall be subject to the same penalties, to be collected in the same way, as for circus and menagerie exhibitions."—*Boston Medical Journal.*

Rinz has found that pus or matter is able to reduce potassic chlorate to the chloride, whereby it must itself undergo decomposition. Burrow has already observed that finely-powdered potassic chlorate, when strewn on gangrenous ulcers and tumors, helped them, and we may suppose that it is due to the oxidizing power of the salt upon pus.

Formula for Summer Catarrh.—Dr. Hoover, in the *American Medical Journal*, recommends a solution of chlorate of potassa, 60 grains, sulph. morph., 12 grains, to six ounces of water to be used as an atomizer. He says it will give relief immediately, and effect a complete cure in a few days.

A writer in an English medical journal considers it well established that "some relation still exists between a depressed state of the barometer and the prevalence of frontal headache."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Black Hills Enterprise; Academy of Sciences; Pacific Eagle Tool Works, 193. Remarks on California Coal; Pacific Electro-Depositing Works; Rich Specimen—The Diltz Mine, 200. Rotary Steam Engine; Furniture Exhibit at the Mechanics' Fair; The Powder Companies at the Fair, 201. Pacific Coast Products; Patents and Inventions, 204.

ILLUSTRATIONS. — Hendy's Ore Feeder for Quartz Mills, 193. Milne's Rotary Engine, 201.

SCIENTIFIC PROGRESS.—Science Reads an Oracle Relating to the Metallurgy of the Future; Simple and Cheap Glass Cells; Improved Method of Generating Chlorine; Metallic Alloys, 195.

MECHANICAL PROGRESS.—The Sand Blast Again; Lanterns; Restoration of Burnt Steel; A New Chinese Composition; Hock's Petroleum Motor; Journal Bearings; New Pumping Apparatus, 195.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 196.

MINING SUMMARY from various counties in California and Nevada, 197.

USEFUL INFORMATION.—Hints to Painters; Flood-proof Bridge; Roofing; Cleansing Bottles, Etc.; Shrinking of Seasoned Timber; Ocher and Umber; Sediment in Lake Water; To Stain Wood, 199.

GOOD HEALTH.—Food and Work; Disinfectants and Deodorizers; Imagination Power, 199.

MISCELLANEOUS.—Refining Base Bullion; Low Grade Ores; Manufacture of Chlorate of Potash; New and Old Towns in California; French Railway Cars; Lap for Polishing, 194. Diamond Cutting; Lac; All About Coffee; Catgut; A Curious Formation; Furniture at the Mechanics' Fair, 198. Work on the Palace Hotel; California State; The Black Hills; Silk Manufacture Again; The Belcher Air-Shaft; Electrical Signals for Mines; Iron Near Auburn; The Van Camp Pavement, 202. Resins; Nickel; The Kossuth Works, 203.

THE HAYDEN EXPEDITION.—Advices from the Hayden Expedition state that Professor Gardner, in charge of the triangulation for work of the Hayden Expedition, has been eminently successful, and has completed the check base line in San Luis Park. It is five and a half miles long, and was measured twice, the measurement agreeing within two and a-half inches, which, considering the unevenness of the country, is a remarkable piece of work. During a period of eight days the party ascended six peaks, three of which are each 14,000 feet high, while the others are 13,000 feet. Professor Gardner and his party spent one night on the very top of Pike's Peak, and nearly had their feet and hands frozen. They are now at work in the San Juan country, where they will remain until cold weather drives them in.

DREAMING.—In a mining camp not a thousand miles from where the Plumas *National* is published, is a man who has spent considerable money and some six years' labor, all on the strength of a dream, in which he supposed was revealed to him the direction of a certain rich gold-bearing lead. His work has proved to others that his "dreams were vain," but he still has faith, and if able would extend his operations to the limit of his lifetime.

A LARGE mill is being built at the Pacific Iron Works for a mine in Santa Barbara county. It is a large piece of mill work, and in strength and finish is in keeping with the production of this foundry, which has acquired an enviable reputation under the management of Messrs. Rankin & Brayton.

THE NORTH ALMADEN MINES.—These quicksilver mines are in the Silver creek region, about 10¾ miles southeast of San José. The furnace is only of 3½ tons capacity. The first run of metal was made on the 14th inst. Some 22 men are at work on the mines.

THE Whelpley & Storer ore mill, of Geo. D. Wyman, formerly of 215 Main street, is now located at No. 413 and 415 Mission street. These works were established in 1871. A complete set of the Whelpley & Storer machinery may be seen in operation at these works at any time.

ANOTHER silver ledge has been discovered and located in the Calistoga district, by J. A. Conlee, a miner recently from Utah. The location is about a mile beyond the Calistoga mine, on the southern slope.

THE Hollister *Advance* understands that another quicksilver mine has been recently discovered on what is known as Chalmer's ranch, about 17 miles south of the town of Tres Piños.

Remarks on California Coal.

At the last meeting of the California Academy of Sciences, Dr. J. C. Cooper, formerly connected with the State Geological Survey, made some remarks on "California Coal" which are of interest. Dr. Cooper, while on the Geological survey, traveled all over the State and had abundant opportunity for close examination, much better in fact than many who have given opinions on the subject, opposed to those given by him. While regretting that the geological facts are against our having any true coal measures, we must recollect that we are more favored than any other part of the world in the extent and variety of our other mineral deposits.

Dr. Cooper said that the papers contain every day several notices of discoveries of coal in California, and always mention them as excellent indications certain to be rich. From these one might suppose that California would soon eclipse all other parts of the world in coal production, but the fact is, that in 99 cases out of 100 these discoveries are of no value whatever. He had examined such coal strata in over 100 localities between San Francisco and San Diego, beside some in Sonoma and Marin counties.

Although the unscientific sneer at geological facts and fancies as not practically useful, they are really the only reliable guide in determining the age and probable value of coal deposits. The true coal of the carboniferous rock in other countries was formed from tree-ferns, algæ and other plants of low organization.

None such had been found on this coast, and from the fact that ours contained remains of coniferous and dicotyledonous trees, geologists had long considered it all as lignite, but practically it was as good as much of the older coal—at least that of Vancouver's Island, Bellingham bay, Coos bay and Mount Diablo. The most northern localities mentioned had been determined beyond doubt by the fossils as of cretaceous age, but there is still some doubt as to those of California, which may be partly or entirely above the cretaceous strata, like the Rocky mountain coal, which is generally considered eocene.

This, however, does not affect the value of fossil evidence, as all the species of both these formations are extinct, and any coal found associated with fossils of living species mostly of later date.

No paying beds of coal have been found anywhere of later date than these. It does not follow, however, that because a stratum is cretaceous, it will pay. Numerous strata in that formation in the Coast range are too thin to pay, though of pretty good quality. None will pay if less than two feet thick, and in most places a thickness of four feet is necessary, if the coal is no better, nor more accessible than that of Mount Diablo. Much of the cretaceous strata is also so metamorphosed that the coal has been ruined by infiltration of iron and silica, with other minerals, the surrounding sandstone being converted into jasper or serpentine.

The fossil shells found in connection with this coal show that it was formed by accumulation of trees, etc., in shallow bays, at the mouths of rivers in fresh or brackish water, and therefore along the shores of older continents or large islands. Often these deposits have been sunk afterwards, and strata with marine shells have accumulated above them to a great depth, when all would be again raised above the sea. In the Coast range, cretaceous coal-strata exist, above which miocene tertiary strata full of shells of living kinds were deposited to a thickness of 1,000 feet, but afterwards removed sufficiently to show the coal beneath.

The beds of undoubted tertiary age are numerous in the Coast range and usually show the vegetable structure so plainly as to be recognized as lignites by everybody, besides differing from coal in a more or less brown tint. Some lignites may pay for working, for local use especially, as they do in some parts of Europe.

Nearly all of that in the Coast range is, however, in either too thin beds, or too full of sulphur and other impurities. In a few places it has been purified and hardened so as to resemble anthracite, apparently by the action of subterranean heat, when the strata are in contact with igneous rock beneath them.

The lignite beds of Ione valley and Lincoln appear to be of one age. The former is described by Prof. Whitney in the State Geology, Vol. I, as being very soft material, approaching peat, and useful only for local consumption. It forms a bed seven feet thick, occupying several small basins in the foot-hills, apparently the beds of former lakes. Numerous fossil plants are found in it, and are considered by him to prove its pliocene tertiary age. The large deposite found near Lincoln, at a much lower elevation, show that this pliocene lignite probably occupies large portions of the Sacramento and San Joaquin valleys, where marine pliocene fossils have long been known to exist, as well as fresh water and terrestrial fossils, which occupied it successively as the country rose above the level of the sea. Much of this coal was, no doubt, formed in lakes, which in filling up left the present marshes.

Phocene coal is also found in the Coast range, but nowhere in paying quantity. Strata from an inch to a foot thick may be seen by any one visiting Long beach, south of Lake Merced, where the pliocene strata, full of marine fossils (which prove their age by the large proportion of living species), are uplifted with a dip of 30° to 40° to the northeast.

In an article in the Proceedings of the Cal. Acad., Vol. IV, p. 244, Amos Bowman described and figured this pliocene formation as one of his "terraces," most of which exist only in his imagination. As seen from east of the bay, the top of the ridge at this point appears tolerably level, but the strata along the beach are plainly inclined 30° to 40°, and were so described in Cal. Geology, Vol. I.

At a distance of 10 to 20 miles many such "terraces" may be seen along the ridges around the bay, but none of these ridges are really terraced in the upper strata, which are everywhere highly inclined. True pliocene terraces do not exist at low levels around the bay and in Livermore valley, containing fossil remains of land animals. Dr. Cooper was investigating these when the survey was suspended last spring. The marine terraces described by Prof. Davidson, in Vol. V., part 1, do not extend within the mouth of the bay, or very near it.

There is a fresh-water deposit in the basin of San Pablo creek, containing thin beds of good lignite, full of fresh-water shells, indicating a lake deposit of probably the miocene age.

The strata have been very much disturbed by volcanic action in all the places where Dr. Cooper has examined them, and are not likely therefore to be profitable. Indications of the effects of the great volcanic convulsions about the end of the pliocene epoch, which destroyed the then existing tropical fauna and flora of California (as described by Prof. Whitney) are to be seen in the coast strata of all the counties so far explored north of the bay, as well as in the gravel terraces containing the remains of the tropical animals and plants, so far known chiefly by the collections of Dr. L. G. Yates, of Centerville (described by Dr. Leidy in a recent publication on the "U. S. Geological Survey of the Territories"). Why does not California see the importance of retaining and publishing such interesting discoveries within her boundaries?

The Pacific Electro-Depositing Works.

There are two or three electro-plating works in this city, but the Pacific Electro-Depositing Works is the only one which plates with nickel, silver, gold or copper, as the proprietors are sole owners of the patent rights for nickel plating on this coast. They plate to order all descriptions of machinery, military arms, car and carriage mountings, cutlery, pistols, plumbers' ware, saloon fixtures, table ware, instruments and hardware. The works are situated on the upper story of No. 134 Sutter street, in the same building with the Electrical Construction and Maintenance company.

Silver-plated copper plates for quartz mills are made to order at these works. They are made of any size and with any weight of metal, according to the wants of purchasers. The plates are made of fine, smooth copper. One side of this sheet is waxed, and it is then put in the bath, and the silver deposited on the other side. The usual quantity of silver used is about one ounce to the square foot, but the silver surface can be made heavy or light, as desired. The advantage of silver-plated copper plates is so well known that it is useless to repeat what has been spoken of so often. Many of the prominent mills use no other kind of plates.

These works only started business on the 1st of May. They have a capacity equal to any on the coast. They do here all the nickel and silver plating for the Kimball Manufacturing company, and a large amount of work for the carriage makers. Samples of their plating can be seen on any of the carriages at the Mechanics' Fair. Old ware of all kinds is replated so as to look like new. Plumbers' goods, hardware and house-furnishing goods are plated here, mostly with nickel, but some with silver. The nickel will not stand salt water well, but ordinary moisture does not affect it. Plated plated with nickel never rust at all when carried in the pocket. Mr. H. G. Ogden is superintendent of these works, and three or four men are kept very busy all the time. The baths are all firmly placed on a thick asphaltum floor, and everything about the works is of a substantial character. Several mining plates for the Idaho mine, Grass Valley, were being made at the time of our visit, and others were ready to receive their silver coating.

MARTIN VICE, boat-builder, No. 22 Mission street, has just finished a handsome barge 32 feet long, 7 feet beam and 28 inches deep. The back-board bears the arms of the Mexican Government, and she is intended as a custom-house boat. She is built of Eastern oak and California cedar, coppered and copper-fastened. The boat is double-banked for 10 oars. She has gratings fore and aft, and when fitted out with sails, awnings and cushions, will cost about $1,200.

THE government reports on mining statistics are hereafter to be published under the supervision of the director of the Mint. It is the intention of the Department to secure the best information regarding the condition of the various mining districts, also regarding new discoveries of the metals, the yield each year, and as near as it can be approximated the probable yield in the immediate future.

Rich Specimen—The Diltz Mine.

We examined this week a finer and richer specimen than we have seen for some time. It was taken from the mine of John S. Diltz, Sherlock creek, Mariposa county, California. This specimen showed as weighed 106 ounces, and was worth $1,800. It was broken in two while being taken out of the mine, and some $500 taken from the softer part of the rotten rock. What remained of it weighed 106 ounces, as stated above. The under portion of the piece was covered with a comparatively flat surface of solid gold, while the upper part was formed of round lumps of gold, some of them as large as the end of a man's thumb. There was a much larger proportion of gold than of quartz in the specimen. The gold from the claim is worth, after melting, $17.55 per ounce.

Few if any of the mines of Southern California have been equal to those of Sherlock creek, in Mariposa county. This is true as to the amount of yield and fine quality of gold. These rich placers very naturally gave inquiry as to the source of the gold, and led to the discovery of the Diltz lode and its partial exploration. This mine is on the north side of Sherlock creek, about five miles northwest from Mariposa. The general course of the lode is north 15° east. The dip is to the eastward at an angle of 50°. The vein is from two inches to three feet in width, and the inclosing walls, talcose slats. The regularity of course and dip indicate a true fissure vein. By inspection of the map of the property, it appears that the explorations on the lode are very limited; yet the mine has yielded bountifully for the amount of work done.

The mine is situated at the head of Rich gulch, about 300 yards from Sherlock creek. This little gulch has been worked since 1849, latterly by Chinamen, and has yielded over $100,000. Mr. Diltz has bought the gulch as an outlet for his tailings. On the other side of the hill the mines yielded very large amounts of money by washing. These claims are also owned by Mr. Diltz, who has a patent for 10 acres of ground on which his ledge is located. He located the ground at the head of the gulch 10 years since, and washed off the surface, getting good pay. About three years ago, while washing off the surface, he struck a ledge of rotten quartz. The ledge was much broken up but was quite rich, and he has worked it ever since, hydraulicing in the winter and getting out rock in the summer. He has never had any crushed at a mill, as he keeps but few men at work, and washes the rotten rock, pounding up the richest in a mortar. He struck the vein at a chimney, and brought down about $5,000 soon after striking it.

The mine is now in a first-rate shape to work. One air shaft in the hill is 60 feet deep. A car level is run in on the vein 240 feet. There is also a large open cut on the vein. The top of the hill has been hydrauliced off and everything paid well. There is no machinery of any kind on the mine, but he has a large quantity of rock ready to crush at any time. The owner digs out the vein, casing, etc., and washes it out. It is then screened and the lighter stuff washed again, the rock being laid aside.

Mr. Diltz intends sinking a shaft at the end of the tunnel. This tunnel, 240 ft. long, is at the end 70 feet below the surface. The shaft will be sunk down past this until it is 400 or 500 feet deep. The tunnel is above the water level, and when continued under the summit of the ridge, will be 130 feet beneath it.

Mr. Diltz located 500 feet of his ground and has bought 700 feet of it. He works three or four men. He owns three-quarters of a water ditch, which supplies his claim with water. There is a rich hill claim just below his mine, belonging to Breen & Levy. They hydraulic in the winter and get out their dirt in the summer, being at work at that now.

THE Australian Polar Expedition, according to late accounts in London journals, was frozen in at the north point of Nova Zembla in August, 1872, and was driven in a northwestern direction with ice. The crew worked five months in vain during the summer of 1873 to free the ship. In the autumn of that year, when north of the 80th degree of latitude, an unknown land was discovered, whose boundary-line, north and west, was not to be seen. A thin line was explored in sledges from the 9th of March to the 4th of May, 1874, up to the 83d degree. In honor of the Emperor of Austria this was named Franz Joseph Land. There were no signs of animal life. On the 20th of May, 1874, the crew of the ship "Tegethoff," in four sledges, and after traveling 96 days, reached Nova Zembla, where they met some Russian seamen, and were taken to Wardoe, in Norway, after undergoing indescribable sufferings and privations.

A DISCOVERY of a very rich quartz ledge has been made on Deer creek, near the Dikeman dam, four or five miles northwest from Grass Valley. Six pans of quartz gave gold to the value of $106, and two pans subsequently gave $60 worth of gold.

A PARTY of prospectors who have been prospecting in the Blue mountains, and over as far as the Snake river country, returned lately, and report the discovery of gold in several places, but not in paying quantities.

Rotary Steam Engines.

The conversion of the reciprocating, rectilinear motion of the piston of a steam engine into a rotary motion required an effort of even the genius of Watt for its successful solution; and having happily accomplished that desideratum, without which the steam engine would have continued nothing but what it was originally—simply a pump, and nothing more—Watt immediately saw the importance, and applied himself to the task, of obtaining a rotary motion from the direct elastic force of steam. This end he never attained; but finally satisfied himself with placing two pistons in such a position as to work by cranks at right angles to each other, as is now done on all railway locomotives and most marine engines.

Many have contended that such a device accomplishes substantially all that a rotary engine could do; but such is not the fact, although the argument in proof of the assertion would be too lengthy and complicated for insertion in this connection, and moreover would not be appreciated by many of our readers.

Many rotary engines have been devised of late years, but all seem to have been attended with defects which render them too impracticable for competition with engines of ordinary construction, and especially with oscillating engines, and all others which work steam expansively. Inventors of rotary engines seem to have generally found it necessary to introduce too much complication of parts to render their inventions practicable; and the usual neglect of the important principle of expansion has of itself been fatal to most devices hitherto brought forward. A want of steam surface, and the proper leverage on the axle for the space occupied and steam used, has also been found an important defect. Time was when several of the rotary engines introduced might have come into practical use; but in the present advanced state of the steam engine, any one which ignores the important matters of expansion, a proper steam surface with reasonable leverage and simplicity of parts, must be considered impractical if not utterly worthless. In the machine invented and exhibited at the Pavilion by Mr. R. D. Milne, an effort has been made to overcome several of these defects, especially those in relation to simplicity of parts and expansion. There are no eccentrics, sliding valves, cranks, connecting rods, beams, or other accessories, inseparable from the reciprocating engine. The steam surface and leverage are both ample and reached in a very simple manner. The principle of expansion has also been introduced in a very effective and ingenious manner. All these advantages are added to the direct application of the elastic force of steam to rotary motion. The engine is exhibited as a working model, but we are not aware that any one of practical working size has yet been put to actual use. The principle seems to be well worth the attention of engineers.

Referring to our illustration, *H* represents a sectional view of the engine, while the large figure shows it in perspective, with the cylinder head removed. The engine takes steam through the pipe, *J*; *C* and *D* are exhaust pipes, with a secondary exhaust at *E*. The cylinder, *F*, is eccentric and stationary as shown, within which a secondary cylinder, *A*, revolves on an axle eccentric to and above the center of the cylinder heads of *F*. The upper portion of the secondary cylinder revolves in constant contact with the upper inner wall of the stationary cylinder, *F*, and forms with it a steam-tight joint. The bulkhead, *B*, *B*, which serves as the piston, with each revolution slides back and forth, with its outer extremities in constant steam-tight contact with the inner walls of the stationary cylinder, *F*. The sectional figure, *H*, shows this bulkhead in another portion of its revolution, having slid considerably from its position, as shown in the larger figure.

It will be observed, particularly in the sectional Fig. *H*, that there are two exhaust ports. It will be evident to every mechanic that but one can be used at a time, the other being closed, and opened only to reverse the action of the engine.

Looking at the sectional figure—and supposing the engine to be in motion from right to left—it is just taking steam through the left-hand steam port, while the steam already shut off will continue to work expansively until the right extremity of the bulkhead passes the right-hand exhaust port. It will be observed that the elastic force of the steam is applied directly to the driving shaft, which may be considered a very important advantage.

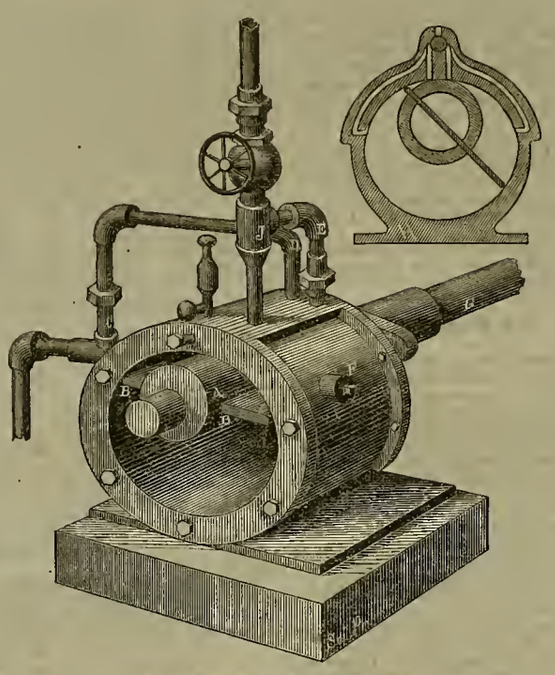
Ventilating Funnel.—The new ventilating funnel at the Consolidated Virginia mine, on the Comstock, is found to work perfectly. The *Enterprise* says it is simply a large wooden chimney, which starts about fifteen feet below the top of the shaft and rises some fifteen feet above the roof of the hoisting works. There being an opening through the side of the shaft into the bottom of the chimney, the steam rising from the reeking lower levels is drawn off and carried up and out into the open air. This leaves the atmosphere clear at and about the top of the shaft, allowing the cable and cages to be seen by the engineers and by the man sending down and taking off cars.

The Lava Bed saloon, the only building left by the fire at Yon Bet, Nevada county, was also destroyed by fire on Friday night, and now nothing remains of what was once a prosperous mining camp.

The Furniture Exhibit at the Mechanics' Fair.

On page 198 will be found some remarks on the furniture exhibit at the Mechanics' Institute Fair, which we continue on this page.

We presume there are few of our readers who had any adequate idea, previous to the opening of the exhibition, of the large amount of elegant furniture which is manufactured in this city. It is only by exhibitions of this kind that the capabilities of our mechanics and manufacturers can be properly brought before the public. Any attempt at a full description of the numerous beautiful articles of furniture now on exhibition, within anything like moderate limits, would most certainly be a failure. There are in this class something like twenty different exhibitors, each of whom has received more or less special mention in these columns. The exhibitors, as a whole, display a great variety of articles, constructed after various designs, either for show or use. Many of the designs, as well as the workmanship, are truly elegant; but the chief feature appears to be utility and convenience. In some of the exhibits very beautiful carvings of flowers, animals, etc., are introduced. In others, the upholstery work, panels of fancy woods and other ornamental devices make an exhibit of great beauty and elegance.



MILNE'S ROTARY ENGINE.

We have already made very full reference to the really elegant exhibition of the California Furniture Company. Goodwin & Co. also make an elegant exhibit of parlor and chamber furniture, manufactured expressly for the Crystal Palace Hotel, corner of Montgomery Avenue and Kearney street. Kimball & Co. exhibit some sample articles of furniture, designed for the Palace Hotel, now being constructed on Market street. The fact that our leading hotels are thus able to have their furniture manufactured here, and are disposed to thus patronize home industry, is a most hopeful sign of the times.

The Pacific United Workingmen's Furniture Manufactoring Co., on Brannan street, also make a fine and varied exhibit of elegant rosewood and plain chamber sets, chairs, dressing-cases, secretaries, etc. Accompanying the exhibit is a large placard, upon which we are told that the furniture shown has been placed there as samples of their work, and not gotten up especially for exhibition. We are pleased to accord this evidence of success of what we suppose to be a co-operative association of workingmen. Such associations are becoming quite common in this city, and have already shown what can be done in the way of co-operative effort, with the employment of but little capital, beyond that involved in the skill and earnest individual labors of the co-operatives.

The show of billiard tables is quite superior to anything which has ever before been seen in this city, and gives evidence that the business of their manufacture has become an industry of much importance.

The number of people now employed in furniture manufacture in this city cannot be less that 2,000; while the annual value of the products is estimated at fully two and a half millions of dollars, and yet about one-half the furniture sold is imported. It is to be hoped that the time is not far distant when the full demand for this product will be met by our own artisans. It has been found that many of our woods, and notably the laurel, are much better adapted to cabinet work than was formerly supposed. Every year some new wood, or other material, is being discovered on the Pacific coast, or its islands, which is found to come in some way advantageously into the manufacture of furniture; and it is now found quite unnecessary to import for such work anything but a few of the hard, dark woods, to give variety to our manufactures. Bedding manufacture, which may be considered one branch of the furniture business, has met with many improvements and modifications here, within the past few years, by the discovery and application of new materials and devices. Eureka hair (soap root) and palm are notable in this connection, as well as the great multiplication in the devices for the application of wires and springs, which the ingenuity of our inventors has brought out.

Newel Posts and Stair Building.

We cannot, in justice, dismiss this subject without a brief allusion to another important part of house decoration and convenience, although it may not come strictly within the department of furniture—that of stair building. In the east gallery of the Pavilion, and near the center, may be seen, in a small but very neat enclosure, several samples of elegantly wrought staircase newels, and specimens of hand railing placed on exhibition by Sanborn & Byrnes, one of the two leading firms making stair-building a specialty in this city. Few know the intricate mechanical difficulties in this branch of architecture—the nights of study and the days of toil and experimenting that every mechanic must give who masters the art.

It is remarkable that the elegant and luxurious staircases we now enjoy are of comparatively recent invention. Vitruvius, a Roman architect, who flourished about 15 years B. C., makes no mention of a staircase as an important part of an edifice; indeed, his silence seems to lead us to the conclusion that the staircases of antiquity were not constructed with the luxury and magnificence to be seen in more recent buildings. Hence, we infer that the manners and customs of domestic life at that period rendered unnecessary a staircase of more than very ordinary description. As near as we can ascertain, no staircases having a complete circular form or partly circular well-hall, with continuous hand-rail, were invented or put up until nearly or about the middle of the eighteenth century.

The earliest method of forming a wreathed rail was by constructing a cylinder parallel to the well to suit the inside of the circle of the rail, and around this bending and gluing together several thicknesses of thin wood sufficient to complete the size of the rail. The next step in advance of this was to get the rail out of solid wood by the use of patterns. The first known author on this subject was Mr. Price, who published in England a book on the subject in 1792. Next came Peter Nicholson, with a more practical and scientific exposition of the whole subject; showing how to cant the plank two ways, and thus get the wreath piece out of much less thickness of stuff. For this discovery Mr. Nicholson was awarded a gold medal by a scientific society of London, and although various other works on the subject have been published since his day, yet the method is substantially the same, all intricate, hard to acquire; and none but thorough mechanics are able to master the art.

Messrs. Ellsworth & Washburn, of Stockton, have also placed three newel posts near this stand, the most notable peculiarity of which is the fact that they have been made from wood grown in the Court House square, at Stockton, in thirteen years from the seed. We have here another evidence of the remarkable rapidity with which valuable timber-producing trees may be grown in this State.

The Powder Companies at the Fair.

The display made by the different powder companies at the Mechanics' Fair is, through force of circumstances, a small one, and not at all in proportion to the value of the industries represented. Probably very few people realize to what extent gunpowder is used, and many suppose that its principal use is in time of war. This is by no means the case, for sportsmen consume large quantities, and blasting operations in mines, quarries, railroads, roads, etc., use up an immense amount annually. Very large quantities of powder of the various kinds are used on this coast; but blasting powder especially is in demand on account of its extensive consumption in mining operations. There is very naturally considerable rivalry among the powder companies as to the best brands for this purpose; but with this we have nothing to do, simply wishing to tell the public something about the varieties of powder which are exhibited at the Fair.

The California Powder Works

Manufacture their powder at Santa Cruz, California, and their office is at 314 California street in this city. They manufacture several varieties of sporting as well blasting powder. The capacity of the mills is 640 kegs of mining powder per day, each keg holding twenty-five pounds. The capacity for manufacturing sporting powder is 20,000 kegs of twenty-five pounds each per year. They employ constantly 200 men and make all the packages, both iron and wooden, at their own mill. The sizes of grain of the sporting, rifle, musket and cannon powder, made by this company are designated by figures and not by letters. The old method of using letters is not considered satisfactory, because there is no standard of F, recognized by the different powder companies. The numbers 1, 2, etc., in the powder made by this company and the letters FFF, FFFg, etc., on that of some other manufacturers, indicate the size of the grain, but have no reference to quality. This company begins with No. 1 for fine grain powder and increases in coarseness as the numbers increase, No. 2 being coarser than No. 1, etc. The finer grains, Nos. 1 and 2, are mostly used in dry weather, and for quick birds; while Nos. 3 and 4 are often used for larger game and longer range, it being a well-known fact that a medium coarse powder shoots stronger than fine, while it is easier on the shoulder.

The company manufacture several brands of Santa Cruz sporting powder as follows: The "Cabinet" is a special brand of powder lately introduced for fastidious hunters. It has a diamond grain, and is the best sporting powder manufactured by the company. It is put up in green canisters. The "Eureka" is put up in red canisters, and is an extra quality of powder, with a crystal grain, and of double extra strength. The "California Sporting" is made more especially for duck shooting, different manufacturers having a custom of making a brand for this purpose. The "Pacific Rifle" is a fine-grained powder, put up in black canisters, and claimed to be a very superior article. "Quail Shooting" is a brand for sportsmen generally, and is designed more particularly for use in shot-guns for all kinds of game. "Sea and River Shooting" is a powder of extra quality, made in view of our long, wet winters and for use about the bays and marshes where so large a portion of the feathered tribe have their homes. "Valley Mills" is a common gunpowder suited for all kinds of uses, hunting, sporting and musket shooting. "Pistol Powder" is manufactured expressly for use in pistols, and is of special fine grain and extra quality. Of course there are different numbers from 1 to 4 of each of these brands.

The California powder works also turns out large quantities of different brands of blasting powder. Of these O signifies coarse; FC, fine coarse; FM, fine medium; F, fine; FF, double fine; and FFF, triple fine.

This company also manufacture Hercules powder for hard rock, pipe clay and cement, XX Hercules (or double strength) for very heavy rock, boulders, etc. This powder is manufactured of nitro-glycerine, and other compounds best known to the makers, and, as they say, "is compounded on strictly scientific principles." The materials of the mixture are chemically prepared, and the manufacturers claim for it safety and economy over other blasting powder.

The works of this company are on San Lorenzo creek, Santa Cruz county. Both steam and water power is used. There are 15 different buildings in the works, besides the small village of cottages occupied by the employees, which is a short distance from the factory. There is an extensive cooper shop connected with the works, where 640 wood and iron kegs are made daily.

We shall refer to the display made by the other powder companies in a future article.

The Winnemucca *Silver State*, of Sept. 17th, says: Rich gold quartz and silver ores have been discovered in Paradise district, which is attracting considerable attention at present. James Herndon, a resident miner of the district, says that a great many claims have been located, three of which are being systematically developed. Two of these—the Credit Mobilier and Rob Roy—are rich in gold, and the other, the Governor Flanders, is rich in silver.

Work on the Palace Hotel.

We have several timea referred to tbe large hotel now being erected in this city. The Palace Hotel will huve 650 rooms above the first floor, or nearly 800 on all floors, making its provisiona for the accommodation of guests aotually stupendous. Its ground area is 350x275 feet. Its great size is not obvious to ths casual observer. No one can fully appreciate the immensity of the work without a visit to the place, a personal obaervation of the manner in which the great army of workmen employed in its construction is manipulated, and the extraordinary regularity and rapidity with which the work goea on. A *Chronicle* reporter has been visiting the building and we condense the following information from his notes, concerning the building.

The Bricklayers.

A phalanx of 225 bricklayers are employed in laying tbe 26,000,000 of bricks that are going into thia immense hotel. They are under the competent superintendence of E. R. Shain, assisted by nine foremen, each of whom directs the labora of 25 men. The men are further divided into sections of 15, each carrying the walls of two rooms. When they are at work there is very little superfluous space. Each section is tended by four laborers, who supply brick and mortar, which are in the proportion of aix wheel-barrow loads of brick to four of mortar. The brick and mortar are brought up by the elevatora, the former from the cellar, the latter from the first floor. The bricklaying goes on swiftly and without jar. The bricks are dumped in the strest, loaded into the barrows, run in on the same level on to the elevators, jerked up to the floors where they are wanted, run off and tumbled at the feet of the man who is to lay them in a apace of time incredibly brief. Tbe elevators carry at each ascent aix barrow-loads of brick or four of mortar, running by tbe chronometer and making a trip every minute. 190,000 bricks are laid daily, and the force employed is capable of running up one wing of tbe building a full story in 10 days. Bricklayiug, for greater ease and expedition, is only carried on on two of the winga of tbe hotel aimultaneously.

Cement and Mortar.

The baaement walls were laid in cement; above the ground tbe walls are laid in simple mortar. The amount of this material required is immense. It is prepared in aeveral rooms of the vast cellar, and accumulates in huge piles far in advance of the needs of the masons. 50,000 feet of mortar will be required for tbe benchwork, an amount that can hardly be imagined by the unpracticed mind. 18,000 barrels of lime and cement are used in making it, and the daily consumption of lime ia now 250 barrels. Santa Cruz lime is used, and each of the men is expected to slack nine barrels daily. Even this portion of the work is scientifically arranged according to tbe rules for the division of labor. A squad of men does tbe slacking, then turns the slacked lime over to the mixers, who unite it with the sand and pile it up for ths hod-carriers. The sand lies close at hand, that wbicb fills the basement beiug of the best quality. The rooms of the baaement are all whitewaahed inside to make them lighter.

Carpenters and Other Workmen.

Two hundred and forty carpentera are employed, though the legitimate work of that special branch of business on the hotel can scarcely be aaid to have commenced. They are in no particular place, but all over the growing atructure whersver their labor is needed upon temporary or permanent woodwork. The blacksmith shop ia on the east side of New Montgomery street, just aouth of the Grand Hotel, and furnishes employment to 15 men. The plumbers occupy a large room in the basement, that will in due time be devoted to the ball and cue, where they have benches, a forge, and all the various paraphernalia of their trade. A corps of riggers is employed for the manipulation of the many ropea in nse here and there about the walla. The plumbing and gaafitting proceeda as the walls go up, under the superintendence of Mr. Milne, of the firm of Buah & Milne. The soil, gas and water-pipes of the building will have a lineal meaaurement of 30 miles. The putting of the iron-work into piace, which, by the way, has delayed the woodwork, givea present occupation to nearly 100 workmen, who are under contract, and do not, consequently, appear on the regular pay-roll. These varioua departments of labor give employment to many persons of secondary mechanical importance, who cannot well be classified, but who help to awell the great total of workmen to an aggregate of more tban 1,000. Eighty cars are in continual use, which require the active attendance of about 100 persons.

The Ditch.—It is a matter of congratulation with the miners and ranchers along the line of the North Fork ditch and in the village of Ashland and vicinity, that the new dam across the North Fork of the American, commenced last year, will soon be completed, and guarantee an abundant water supply for the purposes of mining and irrigation for years to come. It wae feared that inasmuch as the dam was left in an unfinished state last fall, that the surging floods of the winter might have done it considerable damage; but it has happily turned out otherwise, for the simple reason that it is a staunch structure, built on scientific principlea and on a bed-rock foundation.—*Folsom Telegraph.*

California Slate.

The *Independent* has frequently referred to the fact that valuable quarries of slate were known to exist in this State, yet up to the present time little has been done to develop this important interest. Slate quarries in the Eastern States are considered very valuable, and the article is extensively used for roofing, for sidewalks, etc., in many of the Eastern cities, where the demand is so good that the business of quarrying it is found very profitable.

There should be a great demand for the article in this State, as it is a much better material for roofing than anything now used. It will last for years without requiring frequent coats of paint like tin, and it is an equally good protection against fire. It is strange that no greater effort has been made to bring this valuable product into use, as it is evident that were a supply of roofing and flagging placed upon the market a demand would soon be created for the article.

Mr. Emil Hedsch, of Copperopolis, Calaveras county, proprieter of the Pacific State Quarry, near the town, has left at this office specimens of the article that will compare very favorably with that taken from the most celebrated quarries of the East. Among the specimens shown is one set in a frame about 12x16 inches in size, which shows as smooth a surface, and is equal in every respect to the best school slates sold by dealers in that kind of articles. Mr. Hedsch informs us that pieces of almost any size can be readily obtained from the quarry, and that he has found no difficulty in obtaining them eight and ten feet square. They also easily split to the required thickness, and when the necessary machinery is erected to cut the blocks the required size, he will soon be able to place large quantities upon the market. Arrangements have been made for the erection of the necessary machinery to cut the blocks, and it is expected that within the next year this quarry will be turning out aa good slate as can be obtained in the East, and that it will be furnished at a price so low that it can be generally used for roofing, flagging, etc. It is to be hoped that this enterprise may prove a success, as it will add materially to the business of a portion of the State that is not at present particularly prosperous.

The Black Hills.

A careful examination of the best maps of the War Department shows that the east line of Wyoming territory in longitude 104 degrees passes nearly through the center of the Black Hills, north and south. General Custer entered the region from the northwest side of the Black Hills, about latitude 44½ degrees, and traversed nearly the entire western side, down to about latitude 43 degrees, thence bearing southeast into Dakota. The gold discoveries were, in large part, therefore, on the western side of the Black Hills in this territory.

Now, it is well known to everybody that there is no Indian reservation in Wyoming territory anywhere near this locality; but it is also perfectly well known that there is a Sioux reservation in Dakota, which embraces the eastern side of the Black Hills. The present agencies at Red Cloud and Spotted Tail are not upon the Indian reservation proper, but are in the State of Nebraska. It would be time enough for the Government authorities to prohibit trespassing upon the Sioux reservation when they put the Indians upon the reservation. At present they are not upon the reservation, and insist that they will not go there so long as they can prevent it. Why should the Government hold a vast track of rich country for the Indians and not put them upon it, but permit them to reside within the limits of a State where the people do not want them, and where there is no reservation?

There is no reservation for any Indians on the west side of the Black Hills in this territory, and it is in this region that the richest gold discoveries were made. The Indians claim these lands in Wyoming, and as far west as the summit of the Big Horn mountains, and so far south as Cheyenne and North Platte, as unceded lands. They claim that we have no right to the lands along and north of the Union Pacific railroad. At Mr. Brunot's pow-wow with the Sioux chiefs last year, at the old Red Cloud agency, the Indians explicitly said they had not given up these lands, and wanted all white people to move off and go east of Plum creeek, in Nebraska.

The Government, of course, does not propose to accede to any such proposition as this, and yet these are part of the unceded lands and claimed by the Indians; but not a foot of ground formerly occupied by the Sioux, from the northern boundary of Wyoming to the mouth of the North Platte, and thence south to the Republican river, has ever been transferred to the Government by the Sioux. It follows, therefore, that if the people have a right to settle along the line of the Union Pacific railroad, and along the North Platte and other streams in these unceded lands, they have the same right to settle on the unceded lands in the Black Hills. There is no land set apart by Congress for the Sioux in this territory, and certainly there is no Indian reservation near the Black Hills in Wyoming. People have the same right to go into that country which they have to settle in northern Nebraska and around Fort Laramie and Fetterman. The Indians claim the entire country, but the Government does not propose to give it to them; and while by treaty they are permitted to hunt on unceded lands in Wyoming and Nebraska, the authorities do not recognize their right to hold these lands or to prevent white people from going upon them if they choose. General Sheridan can prevent miners from going upon the permanent reservation of the Sioux on the east side of the Black Hills, in Dakota, but he cannot prevent them from entering upon any part of the public domain, claimed and owned by the United States Government, and not set apart by Congress as a military or Indian reservation, nor do we understand from his order that he has any notion of interfering with anybody excepting those who go upon the reservations proper in Dakota.

It is admitted that the rich discoveries made by Custer, including Custer's gulch, are in Wyoming, on the west side of the Black Hills, not upon any Indian reservation, and it follows then that miners or others may go there and settle or work the mines without interference from Government authorities.

The route from this city recommends itself to all who will glance at any reliable map. It is only 200 miles from here to the Black Hills, or about sixty days' travel, with excellent roads, no Indian reservations to pass through, with military posts, mail routes, ranches, etc., to within 50 miles of the mines.—*Cheyenne Leader.*

Silk Manufacture Again.

In our late review of silk manufactures on exhibition at the Mechanics' Institute Fair, we expressed regrets that the Ribbon Manufactory of Mr. J. Green, of Oakland, was not represented. We subsequently, however, found a case of goods from Mr. Green in the western gallery, where they speak for themselves, and afford a practical demonstration that we should have no need to go to France for the very best articles in that line, if our capitalists only had the enterprise to engage in such manufactures here. Mr. Green has demonstrated that a comparatively poor man, unaided and alone, can set up a ribbon manufactory in his dwelling house and turn out at a profit as good ribbons as can be found in our largest importing houses. But, strange to say, he meets with opposition rather than encouragement, in his laudable endeavors to introduce a new and important industry upon this coast. His goods are acknowledged to be superior, while he is willing to put them in the market at prices as low as foreign goods of the same quality can be afforded; but as he lacks the means to manufacture on a large scale, importers refuse to buy of him, and if milliners and other retailers venture to buy his goods, they are at once refused those business accommodations by the importing dealers, which are extended to those who persist in confining their purchases to the imported article. At least we are informed by Mr. Green that such is the fact; and from repeated complaints of the same kind from other quarters we are led to believe that this mode of discouraging home productions is by no means confined to any particular product.

There seems to be a determination on the part of importers, generally, to discourage production and manufactures on this coast. No sooner does a new home product make its appearance in this market than there is an apparent combination among the importers of the article to break down the manufacture here, by importing more largely than ever, and dropping the price down to the lowest possible living figure. The Eastern or foreign manufacturer often joins in the attempt, and by such combination and the greater command of capital too frequently succeeds in the effort. Many an entsrprise has thus been checked in this city, and as many more are not in existence today from the fear of just such opposition. There is also a lamentable lack of patriotism displayed in this matter of encouraging home industries on the part of consumers, who so generally persist in buying foreign products and manufactures, when those made at their very doors are as good or better. We shall never meet with any large measure of success as a manufacturing people until the masses are more inclined to call for and support home productions in preference to those imported, and to frown upon all such unwarranted action as Mr. Green and others complain of as coming from many of our large jobbers and importers.

The Belcher Air-shaft. — Good work—almost unprecedentedly good work—has been done in the construction of the new Belcher air-shaft. The shaft required an excavation to be made 8x16 feet in size. Work was begun on it on the 25th of May last. When the opening of this shaft was proposed by Mr. Donnelly, foreman of the mine, he agreed to complete it to the 850-foot level within four months and at a cost not exceeding $40,000. The shaft reached the 850-foot level last Monday—in 106 days from the time of breaking ground—and the cost has been only about $25,000. The shaft does not stop at the 850-foot level. Work is now progressing between that level and the 900. By next Saturday night it will be completed to the latter level. From that point to the 1,500-foot level it will be continued in the form of an incline, yet it will resemble an immense chimney reaching from the bottom of the mine to the surface. In drawing up from the lower levels the foul and heated air with which they are loaded, this huge chimney will be of almost incalculable benefit. Already its beneficial effects are beginning to be seen in those parts of the mine into which it has penetrated.—*Enterprise.*

Electrical Signals for Mines.

At the Ophir mine all the signals required to be made between the surface and the lower levels are now given by means of electricity. Electrical signal machines, manufactured by the Electrical Construction company of San Francisco, are placed at the stations on all the levels, with plain directions for operating them, and no mistake has ever occurred since these have been in use. The man wishing to signal to the surface has only to press his thumb on a knob, when there is instantly a stroke given on the engineer's bell at the surface and a return stroke on a small bell before him. Every stroke on the bell above is repeated on the bell before him, therefore no mistake can be made. When a bell-rope is used it requires a very strong pull at the depth of 1,500 or 2,000 feet, and then the man pulling the rope don't know whether or not the bell above has been sounded. By this machine no return signal can be made until a signal has first been struck on the engineer's bell. D. H. Birdsall, the electrician in charge, is now engaged in putting in a new style of signal box for cages. A wire connected with the battery above goes up and down with the cage, winding up and unwinding as the cage ascends and descends. By means of this invention a man standing on the cage may signal at any point of his ascent or descent by pulling a small knob ready to his hand. As many wires are seen running in various directions about the works as would be found in a first-class telegraph office. At the shaft they are all gathered together and go down the shaft in a bunch through gas pipes. Besides the signals for raising and lowering the cage, there is another set for calling the foreman from below. When the knob of the box used for this purpose is touched it makes the signals at the stations on all the levels simultaneously. A certain signal made on this box also sounds at all the stations, and means, "Send up the cage immediately."—*Virginia Enterprise.*

Iron near Auburn.

Everybody, doubtless, knows of the large mountain of No. 1 iron ore near the railroad a few miles above Auburn. That this will someday be a source of great value, not only to its owners, but to the entire country, none will doubt. The world wants iron, and is willing to pay a good price for it; and that a mountain of this most valuable mineral, located near a great railroad thoroughfare, is going to stand forever unappropriated is preposterous. For lack of money or enterprise, or perhaps both, it still bears the hand-marks of nature. That this iron field is extensive receives additional evidence from discoveries made within the past week. Croppings of rich iron ore have been found over a space of 40 acres, some distance from the iron mountain, but doubtless on the same lead. Many of the people are anxious for the establishment of manufactories, so also are many of the newspapers, and it is a worthy desire. The opening of these iron mines would be a grand step towards the consummation of that desire. These mines once opened, and smeltings works erected, the heavy cost of transportation would be saved, and the cost of iron would be proportionately lessened. Cheap iron makes machinery cheap; and cheap machinery would materially lessen the cost of building manufactories. The price and demand for the manufactured articles being the same, the inducement would thus be increased. Besides this, cheap iron would lessen the cost of ship building, and thus give an impetus to that important business on this coast; it would lessen the cost of railroads; it would lessen the cost of substantial structures of every kind, and in doing this would give additional substance to the prosperity of the country.—*Placer Herald.*

The Van Camp Pavement.

Five samples of this pavement are on exhibition at the Mechanics' Pavilion, on the east side of ground floor. They have been placed there by the Crushed Rock and Asphaltum Paving Co. The invention was patented at Washington in 1869, by Dr. A. Van Camp. This pavement has been in use on the Drexel boulevard, Chicago, and around two squares on Market street, Louisville, Kentucky, where it is reported to have given entire satisfaction. The pavement is made of crushed rock and pure asphaltum free from coal tar. The work is all done by machinery. After being crushed it is heated in a cylinder twenty feet long, and as it comes out drops into a steam mixer, where the asphaltum in a melted state is thoroughly mixed with the rock. Thus prepared it drops from the mixer into carts, and is taken to the place where it is wanted and spread with rakes and rolled with a heated roller of one thousand pounds weight. The material is very heavy, its specific gravity being greater than granite. It is also claimed to be fire-proof, as was demonstrated in Chicago, where this pavement remained intact after the great fire. It is free from odor, and does not soften in the heat of the sun nor become slippery. It is next to everlasting, being very tough and hard, and slightly elastic. It is expected that this pavement will be used around the Palace Hotel. This material is recommended for streets as well as side-walks, and the company propose to transform our rough, noisy, cobble-stone, horse-killing streets into smooth, durable, and comparatively noiseless and pleasant carriage drives.

Resins.

Ths resins best known to commerce and used extenaively in medicine aud several of the mechanical arts, sre nine in number, aud are known as copal, lso, amber. dammar, common resin, elemi, sandarac, mastic and caramba wax. All thess resins can bo reduced to powder, and all can be dissolved by a union either with acids, oils, or alcoholic preparations. Gum copal is the concreto juice of a tree growing in certain sections of South America and the East Indies. The substance when pure is hard, shining, transparent, citron-colored, snd inodorous. It is uot soluble in water or spirits, hut may be dissolved in linseed oil, when snbmitted to a heat a little less thou sufficient to boil or decompose tho oil. When the solution is dilnted with spirits of turpentine, it forms a beautiful transparent varnish. Shellac, or more properly, lac, is a resinous substance obtained mainly from the *Ficus Indica*, or hauyan tree, on which it is deposited by an insect. It is composed of fivo different but very similsr kinds, each of which is united with a small quantity of soveral other foreign substances, particularly a red-colored matter. Stick-lac is ths compound in its natural state, incrusting small twigs. When broken off and boiled in watar it losea its red color, and is called seed-lac. When melted, strained and spread into thin plates, it is called shell-lac. United with ivory black or vermilion it forms red or black sealing-wax; when lac is dissolved in alcohol or other solvents, and submitted to different methods of preparation, it constitutes various kinds of varnishes and lacquers. Lac is readily dissolved by a union with caustic soda. Amber is a yellowish resin, and resembles copal. It is found on ths sea-shore snd frequently on sllnvial soils with beds of lignite. It is capable of receiving a fine polish, snd is used for ornamentsl purposes, to adoru pipes, walking-sticks, etc. It is also the basis of a fine varnish. By friction it readily becomes elcctric. Amber will not dissolve in alcohol, but it yields to the action of oonccntrated sulphuric acid, which will dissolvs all resins except carsmha wax. The nnion with the sulphnric acid gives dsmmar a brilliant red tint, bnt to other resins a dark brown color. Dammar is obtained from certain trees indigenous to the East Indies; among others the dammara and the dammar pine. It is principally used for making varnish. Dammar dissolves easily in sulphide of carbon, oil of turpentine, linseed oil and henzol. Common resin is the prodnct of the sonthern pine, and is readily solnble in alcohol and the essential oils. Elemi is a concrete substance obtained from several species of trees growing in the tropics, but having mnch the same appearance, and undonhtedly allied in origiu. It is nsed by the medical profession in oiutments and plasters, and hy mechsuics as a base for the manufacture of varnish. This resin dissolves with difficulty in alcohol and linseed oil, bnt gives way under the action of turpentine snd benzol. Mastic exudes from the mastic tree, which grows on the island of Scio in tbe Mediterranean sea. It rnns freely when sn incision is made in the body of the tree, but not otherwise. It is of a yellowish-white color, is semi-transparent, of faint smell, and is nsed as an aromatio and an astringent. It is also used by painters as an ingredient in drying varnishes. Sandarac is the prodnct of a tree growing in Barbary. It is obtained in what is known as transparent tears of a while color, and is nsed principally for incense, and the manufacture of varnish, aod when pulverized and mixed with other snbstances in a pounce as a perfume. The following resins will become pasty before melting: amber, lac, elemi, sandarac and mastic; the others will hecome liquid at once. Ammonia will slowly dissolve oopal, mastic and sandarac; but on the othor principal resins it has very little effect.—*British Trade Jour.*

Nickel.

The demand for nickel for coinage, alloys, electro-plating and other nses has so increased during the past year or two as to considerably exceed the supply, and the manufacturers of the alloy known as German silver have petitioned the Parliament of the German Empire not to still further increase the demand by the introduction of nickel money into tbe country. The cost of German silver, which contains about one-third of its volume of nickel, has gone np nearly $12 per 220 pounds within a single mouth. The aggregate annnal product of nickel (exclusive of the American product), does not exceed 600 tons, of whioh English industries alone use one-half. It is used in the token coinage of this country, Belgium and Switzerland, and the manufacturers say that if Germany should use a similar coinage the supply would not be snfficient to enable manufacturers to use it in the production of cheap imitation of silver ware on account of its increased cost.

Most of the nickel of the world, until within a few years, came from Germany, but the discovery of mines in America has entirely driven the foreign article from the market, and considerable quantities are now exported to Europe. Bnt one deposit is being worked in America, and is believed to he the largest yet discovered in the world. The mine lies in Lancaster county, Pennsylvania, about three miles south of the Gap station, on the line of the Pennsylvania railroad. It is on the high land separating Chester and Pequea valleys, a region rich in minerals; for, beside the copper found in connection with the nickel, there are large deposits of iron snd limestone s short distance south. Ths existenos of copper there was known many years ago; indeed, it was taken out seventy years ago, but the mining was never prosecuted with much vigor, and afforded little profit.

The copper was impnre, but nbout the year 1856 the material mixed with it was discovered to be nickel, snd as the depth of the mine increases so it predominates. The ore is very hard, and tho mining is carried on sltogether by blasting. There are a few Cornish miners to take the lead, but the rest are Americans. A Cornish pumping engine of 75 horse-power drawa half a barrel of water at every stroke from the mine, which is 240 feet deop, and another brings the ore to the surface. Ths ore, in appearance, is iron gray, very hsavy, and in soms pieces the bright copper ore is very prominent. The amount taken from the mine varies from 400 to 500 tons per month. The mining and manipulation of this amount requires 175 hands employed here and at the furnaces. The ore has to be hauled in wagons about a mile to the furnaces, which are situated on very high grounnd, snd overlooks the beautiful Pequea valley. This sitnation was chosen partly that the wind might carry away the noxious smoke and gas, snd partly because of the stores of limestone and flint in the neighborhood.

Ths process adopted is first to throw the ore between the jaws of a ponderous iron bresker, by which it is redneed to smsll frsgments, weighing about half a pound each. Thence carts convey it to the kilns, which are constructed very much like the old-fashioned lime-kilns, except that these have a very tall smoke-stack, to increase the draught. A kilu, holding 80 or 90 tons, is filled with ore and kindled with a little wood. It burns about six weeks, its own gas supplying the fnel for burning out the impurities. The first step toward purification is followed by a process almost precisely similar to that to which iron to subjected. There are three large furnaces, and into these the ore is put, mixed with powdered flint and limestoue (the former predominating) and coke. Abont three draws are made in twenty-four hours, for the work does not stop either night or day, two set of hands being employed. The prodnct of the furnaces is passed through iron rollers and crushed to powder, in order that it may more easily he transported to Camden, New Jersey, where the final process of separating the nickel snd copper, and preparing each for the market, is effected. No waste is allowed. The ore dnst, large quantities of which are made in drilling and blasting, is is mixed with finx and clay, baked in squsre bricks, nnd reduced in the furnaces, just as is the rest of the ore.

The pure nickel commands a high price, varying, ot course, according to the demsnd, hnt averaging over two dollars per pound. Not only does this mine supply all the material for the nickel coins, but nickel is heing extensively nsed in plating iron and other metals, and in various compounds. The whole property is owned by a Philadelphia gentlemau, who has, by his energy and capital, not ouly opened up a new branch of industry to the American artisan, but has taken another step toward making the American independent of other nations. —*Iron Age.*

The Kossuth Works.

The new hoisting works of the Kossuth Mining Co. are not only very neat and substantial, but are also suffioiently powerful to sink their main shaft to the depth of 1,500 feet. They are now well fixed in every respect for the speedy exploration of their mine. Ths main building over their works is 40x80 feet in size, and adjoining this are wings containing the carpenter shop, blacksmith shop, boilers and the like. All these wings are substantial and commodions structures. The pumping engine is of 80-horse power, and the pumping apparatus is all of the most approved pattern, and runs without the slightest hitch or jar. At preseut they have but little water to contend with. The pump running at five strokes per minute, six-foot stroke, keeps the water out of the way of the men working at the bottom of the shaft. While they were freeing their shaft of the water the pump was run at the rate of 26 strokes per minnte, and this rapid motion no more affected the machinery than does the preseut slow stroke. The main shaft is down 220 feet in ground that works very freely. It is the intention to sink to the depth of 400 feet before starting out with another drift. All about the works is most conveniently arranged, everything being after the plans of P. H. Scott, the superintendent of the mine. A very good and labor-saving arrangement is a small reel, carrying a small wire cable, which is used in handling the pump column. By means of this reel a section of column can be let down into the shaft or hoisted out very easily and expeditiously; whereas, by the old plan of raising and lowering by means of a capstan it would be a great job. The hoisting is done by means of twin engines, which are so arranged as to be under admirable control. The foundations of all the engines are on the firm country rock and are as immovable as a mountain. The machinery, which was manufactured at the Gold Hill foundry, was nll put in place and arranged by James Floyd, the present engineer in charge. The works are a credit to the company and to all concerned. We may state as a fact worthy of note that the amount of fuel oonsnmed each 24 hours is bnt one cord and three-quarters of wood. Two boilers are nsed, one of which is 60 inches in diameter and 16 feet long, while the other is 54 inobes in diamter snd of the same length as that first mentioned. Just north of the Kossuth stands the firm and snbstantial hoisting works of the Dayton Mining Co., and a short distance to the southward those of the Daney Co. All three of the first-class works ars s short distance sonth of Silver City, and their erection is an assurance to the people of that towu that their place is bonnd to grow and prosper. Tho three sets of works named are the first ever erected in that section of Silver City district worthy of the name of hoisting works.—*Enterprise.*

It is said thst an admirsble way to preserve sutnmn leaves is to lron them fresh with a warm—not hot—iron, upon whioh spermaceti has been lightly rnbbed.

Mr. Thomas Sutton, the photographer, states that, if calico is dipped for an instant in diluts sulphuric acid, it is rendered waterproof.

Ayer's Cherry Pectoral,

For Diseasee of the Throat and Lunge, euch as Coughe, Colds, Whooping Cough, Bronchitie, Asthma and Consumption.

The few compositions, which have won the confidence of mankind and become household words, among not only one, hut many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as Ayer's Cherry Pectoral. It has been known to the public about forty yeare, by a long continued series of marvellous oures, that have won for it a confidence in its virtues, never equalled hy any other medicine. It still makes the most effectual curos of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the Cherry Pectoral has really rohhed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy he taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it hy you for the protection it afforde by its timely use in sndden attacks.

Pacific Coast Products.

Nothing is more wonderful in history or romance than has been the progress of the States and Territories of the Pacific Coast—and, written aright, neither the grandest epic nor the most powerful novel ever composed by poet or novelist, could equal it. The world at large has always regarded California as the real embodiment of all that was ever imagined or written of the fabled El Dorado, but few ever had a tangible idea of what that wealth really was, or of the wondrous capabilities of it and its sister States and Territories, extending as they do from the Dakota Black Hills paradise to the Golden Gates, and from the placers of Britisb Columbia to those of Sonora. The occasion of holding the Ninth Industrial Fair, which represents in a certain measure this wealth, past and progressive, and bas seemed to us to be a fitting occasion for publishing some reliable statistics to sbow wbat the Pacific Coast bas added to the wealtb of the world from the days of '49 to the no less prosperous ones of the present. Naturally the first tbing that strikes one in this connection is

The Wondrous Wealth in Gold and Silver,

Which has been sent forth to circulate among the various channels of trade, and to revivify the commerce of the world. As may be seen from the annexed table, taken from the San Francisco *Journal of Commerce*, this has been, or by the end of the present year will be, not less tban $1,683,386,241, or $1,385,309,503 in gold and $298,076,738 in silver. That is an amount equal to the total gold and silver coin in circulation in the tbree great commercial nations of tbe world, the United States, Great Britain, and France.

Gold and Silver Production.

Year.	Gold.	Silver.	Total.
1848	$5,000,000		$5,000,000
1849	23,000,000		23,000,000
1850	59,000,000		59,000,000
1851	60,000,000		60,000,000
1852	59,000,000		59,000,000
1853	68,000,000		68,000,000
1854	64,000,000		64,000,000
1855	58,000,000		58,000,000
1856	63,000,000		63,000,000
1857	61,000,000		61,000,000
1858	59,000,000		59,000,000
1859	59,000,000		59,000,000
1860	52,000,000	$90,697	52,090,897
1861	50,000,000	2,275,256	52,275,256
1862	52,000,000	6,247,074	58,247,074
1863	57,000,000	13,486,238	70,486,238
1864	55,967,600	16,797,585	72,765,185
1865	57,496,800	16,184,877	73,681,677
1866	61,000,000	17,000,000	78,000,000
1867	53,000,000	22,000,000	75,000,000
1868	51,000,000	16,000,000	67,000,000
1869	47,000,000	16,000,000	63,000,000
1870	48,000,000	18,000,000	66,000,000
1871	42,357,000	24,246,000	66,603,000
1872	42,688,103	27,548,811	70,236,914
1873	35,400,000	44,600,000	80,000,000
Grand total	$1,342,909,503	$240,476,738	$1,583,386,241
1874 (estimated)	42,400,000	57,600,000	100,000,000
	$1,385,309,503	$298,076,738	$1,683,386,241

If to this aggregate is added $1,000.000,000, in silver taken from the mines of Mexico and the Western Coast of South America, making the wbole $2,683,386,241, it will be seen the Pacific Coast of North and Soutb America has given to the world one-half of all the gold and silver in it, and an amount equal to the value of all tbe gold and silver coin in the world, outside of China and India. What the United States would have done without all this flood of wealtb poured through its commercial veins and extracted from the placers and the bowels of tbe Sierras it is not easy to conjecture. It has been supplied with money for coinage and for foreign trade, and without this inducement to extravagance we would bear little of the balance of trade that has been so large in their foreign commerce against tbe States of the Union. The greater part of the vast capital represented in this way has been absorbed by England, the United States not retaining more than $400,000,000 in coin and manufactures of gold and silver, and the Pacific Coast the great producer, not more in this way than $50,000,000. England has lent it many times over to all the nations of the world, and her money kings now derive imperial revenues from it. One of the most notable things in the above table is tbe steady decrease of gold production, and the increase of tbat of silver, and it seems as though silver mining in future years is to be the great specialty of the mining districts of the coast. Tbe production by States and Territories is shown in the following table:

Year.	California.	Nevada.	Montana.	Idaho
1848	5,000,000	.....	.....	.....
1849	23,000,000	.....	.....	.....
1850	59,000,000	.....	.....	.....

From this it will be seen tbat California has produced two-thirds of the whole, and its production has been nearly all gold. Of the balance, Nevada, which is making gigantic strides year by year, has produced nearly one-balf, cbiefly silver. Utah, the great development of wbich as a mining region is shown by the table, like the neighboring State of Nevada, produces chiefly silver. Of the balance of the States and Territories represented, the yield of all, save Colorado and New Mexico, bas been rapidly decreasing. But tbese Territories, as well as Utah and Nevada, bid fair to rival California itself, in its palmiest days. As for Idaho and Montana, with the introduction of capital and macbinery we may expect to see them look up again and become as famous as of yore. Oregon and Washington, as well as British Columbia, will never take any great position as Gold and Silver mining States; but Arizona, when life and property are secure from Apache deprcdations, will probably equal in importance any portion of the Pacific Coast. But only a small portion of tbe vast wealth of this girdle of mountains has been as yet extracted, and we are of opinion that they are destined to flood the world with wealtb for centuries to come.

Lumber.

The immense extent of the mighty forests that clothe tbe sides of ihe Sierras and the inferior ranges—in fact the whole mountain system, from Panama to Icy Cape on the Arctic Ocean, has been known by but few. Few eitber have known that there is lumber enougb

To supply the World a Thousand Years,

And tbat all civilized countries will by and by have to look to tbe Pacific Coast for their needs in this regard. Such however is the fact, and though we have been nibbling away at it for a quarter of a century, and have in round numbers manufactured

Four Thousand Million Feet,

Wortb in this city say forty million dollars, we havs yet, as it were, only nibbled at these mighty woods. The following table sbows the amount exported to forcign countries from San Francisco. The total amount exported from Puget Sound etc., is about double this:

Year.	Feet.	Value.
1859	3,750,000	$ 86,49
1860	3,445,731	75,808
1861	3,337,839	73,748
1862	9,197,631	175,140
1863	6,559,062	159,586
1864	11,488 610	248,951
1865	2,091,913	255,038
1866	7,732,567	155,498
1867	5,482,693	129,629
1868	7,660,801	172,858
1869	8,314,116	182,760
1870	13,224,990	240,199
1871	31,662,000	300,297
1872	16,010,000	314,192
1873	17,441,000	346,370
Total	143,529,463	$2,918,714

In modern days the great agents of civilization have been

Coal and Iron.

Of the former there has been mined and sent so San Francisco in the course of 14 years, ending January 31st, 1873—1,821,605 tons, wortb $14,000,000—the whole amount produced being a trifle in excess of this. Oregon Pig Iron commands to day the bighest price in our market, and California will soon bave as good Pig Iron as Oregon. The following table shows tbe Coal of domestic sources imported into San Francisco since 1860:

Year.	Vancouver.	Coos Bay.	Bellingham.
1860	6,685	3,143	5,458
1861	6,473	4,688	8,136

Coos Bay	164,432
Seattle	32,737
Rocky Mountain	3,854
Grand total	1,821,605
Worth	$14,000,000

California Copper

Used to be of much commercial importance, and doubtless will be so again. We bere give particulars of its export, wbich will also pretty nearly represent its total products:

Year.	Tons.	Value.
1861	1,759	$122,581
1862	3,389	293,194
1863	5,933	512,925
1864	14,315	1,394,660
1865	25,830	1,821,360
1866	19,613	1,393,892
1867	7,833	421,546
1868	5,077	227,925
1869	2,542	113,733
1870	2,254	113,732
1871	2,552	121,950
1872	2,193	115,970
1873	1,832	114,852
Total	95,322	$7,371,830

We divide with old Spain the honor of supplying tbe world with

Quicksilver.

But whenever Spain bas it in rills we have it in streams, as the numerous discoveries every day taking place prove. The following are the details of its export;

Year.	Flasks.	Value.
1859	3,357	$126,262
1860	3,893	3 8,330
1861	35,218	1,112,654
1862	35,707	1,169,197
1863	26,060	966,748
1864	41,252	1,527,964
1865	41,256	1,733,238
1866	30,789	1,082,940
1867	28,824	929,726
1868	43,507	1,330,054
1869	24,385	747,671
1870	12,959	402,051
1871	11,244	852,125
1872	14,721	875,414
1873	6,168	462,495
Total	369,400	$13,656,883

Value of Pacific Coast Products since 1848:

The total addition made to the wealth of tbe world by the Pacific Coast, may be seen from the following table:

Gold and Silver	$1,683,386,241
Manufactures	600,000,000
Wheat produced	300,000,000
Wool do	45,000,000
Lumber do	40,000,000
Coal do	14,000,000
Wine exported	5,117,974
Salmon do	1,554,052
Copper do	7,371,630
Quicksilver exported	13,656,883
Hides do	8,675,611
Tallow do	452,259
Other prodnce	20,000,000
Add for Consumption	15,000,000
Add for 1874	15,000,000
Total	$2,769,214,700

Merchandise and Treasure Exported.

We append a table sbowing the total exports of Treasure, Domestic Produce and Foreign Produce since 1848:

Year.	Merchandiee.	Treasure.	Total.
1848-50	$2,000,000	$66,000,000	$68,000,000
1851	1,000,000	45,989,000	46,989,000
1852	1,500,000	45,779,000	47,.79 000
1853	2,000,000	54,985,000	56,985,000
1854	2,500,000	52,045,633	54,545,633
1855	4,189,611	45,161,731	49,351,342
1856	4,270,516	50,697,434	54,967,950
1857	4,369,753	48,967,697	53,346,450
1858	4,770,163	47,548,026	52,318,189
1859	5,533,411	47,640,462	53,173,873
1860	8,532,439	42,325,916	50,858,355
1861	8,883,972	40,675,788	50,564,830
1862	10,565,294	42,561,761	53,127,055
1863	13,877,399	46,071,920	59,949,319
1864	13,371,752	55,107,201*	68,978,953
1865	14,554,130	44,426,172	58,980,302
1866	17,281,849	44,365,668	61,647,516
1867	22,421,295	40,671,797	63,093,083
1868	22,744,235	36,358,096	59,202,331
1869	20,946,349	37,287,114	58,133,163
1870	11,762 742	22,983,139	50,752,881
1871	13,992,283	17,253,346	31,245,629
1872	23,698,598	29,330,433	53,029,031
1873	29,711,371	24,641,041	54,352,412
Total	$271,381,275	$1,039,536,390	$1,310,917,660

*—Including $5,000,000 dutiee.

THERE are 69 quartz mills in Nevada county, California, 42 of which are run by steam and ths rest by water powsr.

THE Brunswick mill, Carson river, is being rnn to but balf its capacity, owing to tbe low stage of water.

UTAH bas fivs narrow-gauge railroads, four of whicb ars in operation, and the fiftb will bs opsn on tbe 1st of November.

A CHILENO found a gold nugget wortb $99 wbils bunting quail in the monntains near Colusa.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Sept. 22d, 1874.

FOR WEEK ENDING SEPT. 8TH, 1874.*

ARTIFICIAL FLOWERS.—Mary Barnss, Truckee, Cal.

TIE-LINK FOR CHAINS.—Wm. Quinlan, Mayfield, Cal.

MINING LANTERN.—Coolidgs B. Brown, Placsrvills, Cal.

TRADE MARK.

FOR CANNED SALMON.—Cutting & Co., S. F., Cal.

*The patents are not ready for delivery hy the Patent Office until some 14 days after the date of issne.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

LEATHER.

WEDNESDAY M., Sept. 23, 1874.

METALS.

WEDNESDAY M., Sept. 23, 1874.

Contrary to expectations the price of Quicksilver has not yet advanced. Advices from New York and Europe would have seemed to warrant such a movement, but the market has no doubt been influenced by the very favorable prospects now held out by newly developed mines.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"*The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated.*"

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Black Mountain Coal Mining Company.

BALL'S

SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v23-tf Oakland.

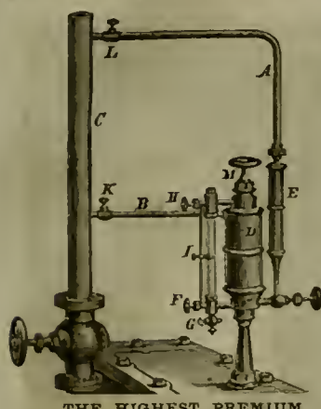
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
10v27tf J. HENDY, No. 32 Fremont Street.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; 1, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Man factured by California Brass Works, 125 First street, S F. 24v23tf

6v29-4m

Improved Cast and Forged STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco.

Important to Miners and Mill Men.

ASSIGNEES' SALE IN BANKRUPTCY.

NOTICE IS HEREBY GIVEN THAT THE UNDERsigned, under and by virtue of the power and authority vested in them, and by virtue of an order of the District Court of the United States for the District of California, made and entered on the 16th day of September, A. D. 1874, in the matter of the MENDHA SILVER MINING COMPANY, Bankrupt, will sell at public auction, in the city and county of San Francisco, at the auction salesroom of John Middleton & Son, No. 310 Montgomery street, on

Friday, the 23d day of October, A. D. 1874

At 12 o'clock, M.,

All that certain mining and mill property and premises situate in Highland Mining District, near Pioche, State of Nevada, described as follows, to-wit:

One twenty-stamp mill and machinery, together with the appurtenances belonging to the same and necessary for the proper working thereof;

Also, the mill site and the spring known as Mendha Spring, and the tract of land surrounding the same to the extent of twenty(20) acres;

Also, all the water-pipe connecting the springs with said mill;

Also, the buildings, office, stable, boarding-house, etc., upon said land and adjacent to said mill;

Also, the "Stetefeldt" furnace in said mill;

Also, the following named mines, to-wit:

Mendha Mine;
Mendha West Extension Mine;
Regent Mine;
Arizona No. 2 Mine;
Chief Mine;
Crown Prince Mine;
Sadowa Mine;
Alaska Mine, and
Mendha East Extension Mine;

Also, the hoisting works, machinery and all other appurtenances connected with said mines, mill and premises.

Said property is known as the Mendha Mill and Mines.

Terms of Sale—Cash in U. S. gold coin; ten per cent. on fall of hammer, balance on confirmation by U. S. District Court.

For particulars respecting this property apply to the undersigned, at their respective places of business, and to J. M. SEIBERT, Agent of Wells, Fargo & Co., at Pioche, Nevada

Dated San Francieco, September 17, 1874.

John Middleton & Son, Auctioneers. sep26-4t

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering four sizes of ore to four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 3d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps this machine constitutes a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 12 or 15 tons per 24 hours.

For particulars apply to,

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Snbmarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder nsed in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.
v22-3m16p

THE PACIFIC REDUCTION WORKS.

GUIDO KUSTEL, - - - Superintendent.

WILL PURCHASE GOLD AND SILVER BEARING ORES, CUPERIFEROUS SILVER ORES, GOLD SULPHURETS, ETC., AT THE HIGHEST RATES, OR WORK THE SAME FOR ACCOUNT OF OWNERS.

Office, 210 Front Street, San Francisco.

N. W. SPAULDING,

Saw Smithing and Repairing ESTABLISHMENT.

Nos. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

W. T. GARRATT.

CITY Brass and Bell Founder,

Corner Natoma and Fremont Streets,

MANUFACTURERS OF

Brass, Zinc and Anti-Friction or Babbet Metal CASTINGS,

Church and Steamboat Bells,

TAVERN AND LAND BELLS, GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS.

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZLES for mining purposes, Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf

FOR SALE.

One 20 and one 10-Stamp Quartz Mill with Hoisting and Pumping Engines, Pumps, Columns, Tubs, Cars, &c., good as new.

A. L. FISH,
tf 9 and 11 First St., S. F.

SAN FRANCISCO, SATURDAY, OCTOBER 3, 1874.

VOLUME XXIX Number 14.

Improved Air Compressors.

William H. Fauntleroy, of Eureka, Nev., has recently patented through the agency connected with this office, an apparatus for multiplying, accumulating and storing power to be used for the various purposes for which other and more costly power is at present employed. His improvement contemplates the employment of a hydrostatic engine which may be operated by any suitable power, for the purpose of compressing air, so that the air may be transmitted by proper means to any point or points where it can be used for motive purposes.

Figure 1 of the accompanying engravings represents a sectional elevation of the apparatus. A C M is a vessel containing water or other fluid, the surface areas of the cylinders, C, and A, being, for the purpose of illustration, as 1 to 10. D is a water wheel, E a walking beam, and B an air reservoir. F is a piston rod carrying head in the cylinder C. G is the crank which is attached to the end of the wheel shaft, and which is connected with the walking beam by the connecting rod, H. K K are guide rods connecting with the diaphragm, L, and attached to a collar around the reservoir, B. These rods play on two guides on the sides of the air reservoir B, and are connected to the beam, E, by rod O. L is a diaphragm carrying two piston heads, *i*, *n*, the lower one, *i*, on the surface of the water and the upper and smaller one, *n*, playing in the cylinder Z, which is of the same surface area as the cylinder, C. Z has air pipes, *s*, *s*, leading through the reservoir, B, or has a valve in the cylinder head opening upward and receiving air from the diaphragm space, which will be provided with air-valves opening inward. V is a valve opening upward into the air-reservoir, B. N, N, is the gallows or supporting-frame, and P is a pipe for the transmission of force when needed, now shown closed.

A pump, X, or reservoir, will be required to supply water, as it will lose by evaporation. Temperature and pressure gauges and safety valves are also provided. The metal is calculated to withstand a pressure far within the bounds of safety. Thus force and its equivalent in heat may be transmitted under pressure to distant localities.

Figure 2 is an upright cylinder which is intended to take the place of the cylinder, A, in Fig. 1, where it is desired to produce heat by compression of air. There is no difference in the construction of the machine, except that below the valve, Y, there is a very small and long aperture, or a number of them, through a solid block of metal bushed with platina or other metal, so that when the upstroke is made by the diaphragm, L, the air or gas in the cylinder, Z, will be compressed through the aperture into the air reservoir, B, with multiplied force and in consequence of the violent compression and friction the air or gas will be expanded, and a great degree of force and heat will be produced in the reservoir, B; sufficient, the inventor claims, to warm houses, cook food, reduce ores, disintegrate substances, prepare anhydrous lime, and generally for all purposes of science, art, manufacture and domestic use for which heat is now, or may hereafter be used, it being the mechanical equivalent of force.

This machine, it is claimed will produce highly expanded gas of any kind, before or after transmisson, by admitting the gas into the cylinder, Z, through the tubes connected therewith, and forcing it into the reservoir, B, through the aperture, from where it will pass through the pipe, P, to distant localities.

Pressure gauges will show the pressure. Temperature and pressure being proportional, temperature will show the pressure. These gauges afford the means of utilizing the hours of night as any given pressure may be sent in any given direction. Reservoirs of proportional area give a proportional amount of force, and the amount used may be measured by a meter. Water and all fluids may be transmitted in the same manner by means of pipes and reservoirs, provided that in no instance must the point of desired transmission be at a greater hight than the original reservoir. The inventor provides that engines and condensers now in use may be employed. The pipes and reservoirs are supplied with pressure and temperature gauges, safety valves, connections and stop cocks where needed.

The inventor does not claim the hydrostatic principle involved in this invention. He claims that by the use of force thus supplied to places more or less remote, railroad cars, vehicles, factories and vessels plying upon the navigable waters, can be propelled, and that heat can be supplied for the arts and sciences, and every conceivable domestic use, where force heat and gases are now or hereafter may be used.

In describing his invention, Mr. Fauntleroy writes as follows: "It will be observed by tracing the effect of this machine through its several parts, that it affords a clear and vast multiplication of force and heat. That in case of small cylinder head has an area of 100 square inches, for illustration, it will excel a force of 1,600 pounds to the square inch. We therefore pick up the time that was lost in the hydrostatic press" while the accumulated force has been preserved. I therefore announce that this machine affords a clear and vast multiplication of force and heat. It will multiply a water stream, a coal mine, or any other source of force many times conveniently. It will remultiply force or heat after being once obtained.

"Force and heat are proportional, and can be converted one into the other. By substituting the cylinder with narrow aperture, the air and the gases may be immediately expanded, by the very great compression and friction resulting from the force attainable by this machine. Again, if the small cylinder head in the diaph-

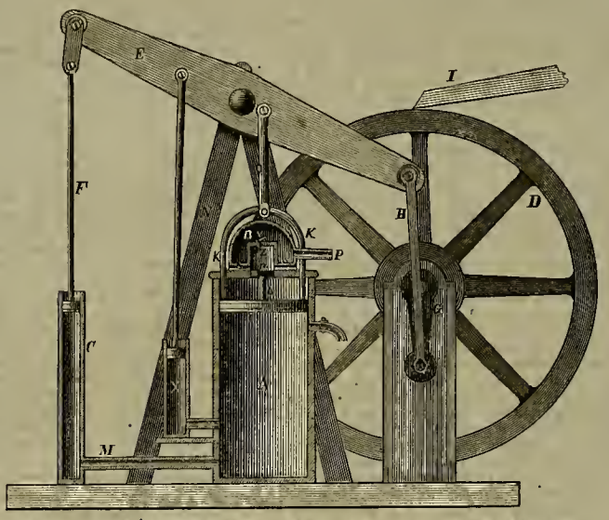

FIG. 1. FAUNTLEROY'S IMPROVED AIR COMPRESSOR

water power being the source of supply, its run without fuel and without attendance, except to keep it clean. If the force on the wheel be 4,000 pounds, then on the crank, which is one-fourth of the semi-diameter, it will exert a force of 16,000 pounds, minus the friction; and it will be 16,000 pounds on the small cylinder,

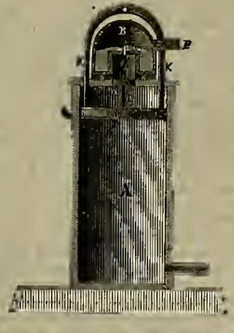

Fig 2. Cylinder to Produce Heat.

C, minus the friction, which is small, and for illustration need not be taken into account. If the small cylinder has an area of 100 square inches, then the force exerted on it will be 160 pounds to the square inch. It will also be 160 pounds to the square inch on the large cylinder, A, which may be 10 times the area, in which case the force exerted on its surface will be 160,000 pounds. We have here accumulated force at the expense of time. This is the hydrostatic press."

"Now, the diaphragm working on the surface of the large cylinder, moves with a force of 160,000 pounds, and the smaller or upper cylinder head being fixed to the large one, also moves with a force of 160,000 pounds. If the ragm be divided longitudinally, it will increase the force 100 per cent., or to 3,200 pounds per square inch in this particular case. Therefore, when heat is desired for domestic use and in the arts and sciences, it can be obtained. Thus, structures of all kinds may be supplied with heat from water power or other force. Wine may be prepared, fruit dried, brick burnt, ores calcined and crushed, mines ventilated, the flow of water increased and pumped over mountains, and all by water power or by coal consumed at the mine, absolutely multiplying a mine many times. A city may be supplied with force and heat for manufacturing and other purposes, with much less expense for water works than has been usual, while a very small pipe will convey multiplied force for extensive use. There is less deterioration than in the use of water by pipes or ditches, there being no loss by absorption. In fact, it enters into all the ramifications of business in life in the most economical manner.

"I have also caveated a high-force engine for factories, cars, vehicles, etc., which for economy and simplicity I consider unequaled. There is no fire used, and no insurance necessary. The labor and wear and tear are quite nominal. For particulars, write to the inventor at San Francisco, until further notice. An engineer will be sent with plans and specifications to utilize this invention. Exclusive rights are for sale for the United States and other countries."

THUNDERSTORM.—San Francisco and vicinity was treated on Wednesday to a display of a regular old-fashioned thunderstorm. From a few minutes before six o'clock, till about seven, vivid flashes of lightning followed each other almost continuously, accompanied by frequent and heavy bursts of thunder. But little rain fell. The storm took a north-westerly direction. It was the severest electric disturbance ever known in this region, and astonished "the oldest inhabitant." Some of our people are beginning to think that earthquakes have left us and thunderstorms taken their place.

Patronize Home Manufactures.

One of the main objects of such an exhibition as the one just concluded in this city is the facility which it affords our mechanics and other producers for advertising the fact that they are able to supply the public with all the thousands of objects which they have, collectively, on exhibition, and of which that public are in daily need. No Californian could visit the Pavilion without indulging in a feeling of pride at the really surprising exhibition which is there made of what can be done in a city of twenty-five year's growth, and which has been built up with an intervening uninhabited space of 2,000 miles extent between itself and its nearest metropolitan neighbor! If every one who thus glories in the progress which has been made by our city and State, and feels a just pride in being a Californian, would only give his countenance and support, when practicable, to California productions and manufactures, our progress would be vastly accelerated. Artists, inventors, producers and workmen, generally, are pleased when a discriminating public praises and approves their skill and industry; but approbation is of little value unless it is accompanied with the solid, substantial benefit of patronage in preference to foreign productions.

In the early Fairs of this city our own artisans had very little to present of their own workmanship; consequently visitors were called upon to look at long arrays of foreign products, and there was for that reason but little enthusiasm manifested in the exhibitions. Now all that is changed; and our home manufacturers took nearly all the space in the Mechanics' vast Pavilion, and asked you to examine the handiwork of our own artisans. Gold was then the chief product of the State. Now it is chiefly to our local manufacturers that we are to look for progress and prosperity; and surely it is not wise economy to let them starve while we fail to benefit ourselves pecuniarily or otherwise in purchasing imported articles. It is poor economy to look abroad for what we want, even when we can save a few cents or dollars by so doing. Our State's prosperity would be impossible under such circumstances.

On looking around the Pavilion we could hardly call to mind anything, except a few specialties depending upon climate rather than skill, which we cannot obtain at our very doors, and from the hands of our producers. Boots and shoes, hats, clothing of almost any kind, silks and ribbons, machinery, tools, jewelry, gold, silver and other plate, carriages and wagons, bedding and furniture either of the richest and most gorgeous description, or of the plainest and most substantial; works of art, whether in painting, sculpture or other schools, are all produced by our own artisans and artists of a quality equal to the best, and at prices as low as they can be obtained from any other quarter. Let us then resolve to ignore all unnecessary importations, and support our own manufacturers.

It is a matter of no little gratulation that the finest hotel on the continent is now being built in this city, and will be provided throughout with furniture made in our own factories. All credit to the enterprising proprietors who have resolved to do so patriotic and praiseworthy an act. The rich will make themselves richer, and vastly increase their popularity by distributing their surplus cash in encouraging the skill and industry of own our mechanics. If the wealthy citizens of San Francisco would seek out and, wherever they can be obtained, purchase for their needs only such articles as are produced on this coast, the money thus invested would return a double interest in the way of encouraging immigration, and in the increased value it would give to real estate, over what it would if invested in the same goods of foreign manufacture.

If this exhibition shall result in inducing our home manufacturers to advertise more pointedly than heretofore the fact that their products are home made, and incline purchasers to bear in mind, when they go to buy, the propriety and importance of patronizing home industry, it will have accomplished not only a great but a most patriotic work, and will be the means of adding millions to the wealth of the State.

The State University.

The Committee of the Board of Regents, appointed to prepare a reply to the memorial of the Committee of Grangers and mechanics remonstrating against the removal of Prof. Carr from the Chair of Agriculture (which memorial has already appeared in these columns), have prepared and published a lengthy reply, from which we make the followiog extracts:

What the University Is.

The committee state that the memorialists "are under a misapprehension in supposiog that the Coogressional grant, as it is called, was 'for the support of State Universities.' The grant was for 'the endowment, support and maintenance of at least one college, where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches as are related to agriculture and the mechanic arts, in such manner as the Legislatures of the States may prescribe.' The Act of Congress does not establish a university, but a college, leaving the State great liberty to carry out the details of the plan. The University of California is established by the State of California, and includes the college referred to in the Congressional Act. The law of the State says: 'The University shall have for its design to provide instruction and complete educatioa in all the departments of science, literature, art, industrial and professional pursaits, and general education; and also special courses of instruction for the professions of agriculture, the mechanic arts, mining, military science, civil engiaeering, law, medicine and commerce; and shall consist of varioas colleges, namely: First, colleges of arts; second, a college of letters; third, such professional and other colleges as may be added thereto or connected therewith.' The University is fouuded by the State, and includes the *College* referred to in the Act of Congress."

The Mechanical Department.

The Committee deny that they have totally iguored the mechauical department; but that, on the contrary, that department was early organized with a complete four-years' course, os may he seen by consulting the annual registere published for the last four years.

The Attention Given to Agriculture.

The Regents hold that the memorialists are in error ia the assertion that they have chosea but one professor for Agriculture, while for the College of Letters they have 19 professors snd assistauts. They say that "the students of the College of Agriculture have a *right* to receive instruction from *all* the instructors," and that they are "*compelled* to receive it as a part of their prescribed course from *thirteen* of the professors."

The orgsnic law creating the University, makes it the daty of the Regents to estahlish the College of Agriculture first, and next, the College of Mechanics. This duty the Regents have faithfally discharged. Those two colleges were the first organized. They were the first eqaipped with the necessary material and apparatas. * * * The College of Letters stands precisely ss the Legislature bequeathed it to the Uoiversity.

In reply to the assertion that the College of Agrioulture has been neglected, the Regents call attention to the following facts, premising that not a year has yet passsed since the completion of the huilding and the heginning of instruction at Berkeley. They also remark that Dr. Csrr, uader oath, last winter, before the Legislative committee testified that the Regents had done ss well as they could in the time snd with the money st their disposal. He also testified that the course of instruction compared favorably with that of sgricultural colleges elsewhere. That course of instruction has not since been modified.

The Progress of a Year.

Within the past year the following, among other thiogs, have heen accomplished:

The Berkely property has been surveyed by a competent engineer, the right places marked out for agriculture, horticulture, botanical garden aud forestry, and also for roads, paths, buildings and bridges. This has also been mapped.

A special earvey has been made of the water rights of the University, so that the snpply of water for household and garden purposes and the drainage may be wisely regulated.

The grounds have been placed under the charge of a competent agriculturist, who is also by law the Secretary of the Board, residing and holding his office at Berkeley.

With him is sssociated a well trained gardener, who has charge of horticultural work.

The manual labor of the students have heen employed and paid for at good prices.

A convenient propagating house, with the necessary appurtenances, has been oonstrncted.

A barn hae been contracted for.

Additions have been made to the Agricultural and Botanical Museums.

A special appropriation of $1,000 has been made for the purchase of Auzoux models, showing the interual structure of domestic animals and plants.

The lecture diagrams made use of by the late Professor H. J. Clarke, of the Amherst Agricnltural College, have been bonght.

Four Eastern gentlemen, familiar with the agricultural schools of other states, have heen invited to come here and give special instruction to the students in agriculture, ia addition to what they will receive as heretofore from the Professor of Agriculture.

Arrangements are msking to secure the aid of California agricnlturists in the specialties of which they are devoted, and to enable the students to visit the best fsrms, dsiries snd gardens of the neighborhood.

A diploma, equal if not superior to thst given in the College of Letters, and sppropriate to aid the scientific colleges; has been engraved and given to the agricultursl grsduates of this year and the last.

A printing establishment, at an expense of some $6,000, has also been equipped, where some twenty or thirty students, under proper regulations, will find appropriste practice aud remuneration.

Why Prof. Carr was Removed.

As regards the removal of Prof. Carr the Regents give no other reason than that olready assigned; hut simply claim it their duty to "know more of the fitness or unfitness of any member of the educational stsff than their fellow-citizens of the State, in general can koow."

In relation to the expression of the memorialists in opposition to the appointment of agricultural lecturers, the Regents say in effect that the organic act mokes them the judge of this matter, and that they have acted accordiugly.

In conclnsion the committee expresses the opinion that much apprehension exists with regard to the condition and management of the University, to correct which it advises the people of the State to visit the University aud observe for themselves its administration and system of instruction.

American Metals.

With the rapid development of the mineral resources of the United States the time is not very far distant when this country will oot only be in a position to supply its own consumptive demand, but have a surplus for export.

American copper is now conceded to be the best in the world; and, although only about one-third the world's supply is produced here, the production is rapidly increasing, though in the copper trade Chili is still far ahead of us, but its export trade is now on the decline. From 1863 to 1867 the yield in this country averaged about 15,000,000 pounds. Since that time it has greatly increased, and was, last year, nearly 35,000,000 pounds. The French prefer American copper for certain pnrposes, and it often commands a premium of 3c per pound at Paris and Havre, notwithstonding England is so nesr. The exports to France last year were 1,000,000 pouads, while before the late wsr the exports were between 3,000,000 and 4,000,000 pounds. Eagland exports to this couatry, but prices are now too low here to make it profitable with the present tariff. The Lake Superior region is far ahead of other sections of the Union in the production of copper; the miaes there yield nearly 29,000,000 pounds, while the yield from all other sources was only 6,000,000 pounds. It is thought that the production of the lake mines will be much larger this year.

The demand for American lead is also steadily increasing, and the imports from Europe for several years past have heen on the decrease. Satisfactory experiments have been made with the American, and as soon as the refining of it reaches the desired standard, to which attainment due attention is now being directed, the native product will eqnal the hest Earopean. There is now a difference of ahout three-quarters of a cent in favor of the foreiga, although the native lead sells the most readily. The development of the silver mines in the far West necessarily increases the productiou. The country prodnces about 35,000 tons, distributed about as follows: Colorado, 2,000 toas; Missouri, 11,000 tons; Galena region, Ill., 3,700 tons; to this is added the quantity smelted at Chicago, Pittsburg, New York, Newark and other places.

Spelter is another metal the demand snd consequently the productiou of which is increasing in this couutry. In accordance with the action of the underwriters, a few years ago, vessels are re-metaled every three years, and instead of copper, a composition of spelter and copper, known as yellow metal, is used. Hence the increase in the demand for the former metal, and the production has been augmented to such an amount as to materially diminish the imports. The prodnction in 1872 was 5,500 tons; in 1873, 6,500 tons, while the imports in the former year were 4,000 tons, and last year they fell off to about 2,500 tons. The American spelter is as desirable as, and in point of purity superior to, the Silesian, which is said to be mixed more or less with lead. The states of Missouri, Arkansas and Illinois are steadily growing ia importance in the production of spelter.—*Iron Age.*

BREAD MADE WITH SEA WATER.—Sea water as a beverage is not considered agreeable or wholesome, but experience has shown that it may be advantageons for making bread. Bread thns made is said to be not merely agreeable, but to possess bygienic qualities. *Les Mondes* says that during a voyage of a sail vessel from Havre to California, having oa board 160 passengers and a crew of 25 men, under the command of Capt. Liger, bread made with sea water was used exclusively, and that during her long voyage—ehe was five months out—there was not on board a single case of sickness. The editor believes that sea water hread may not merely be of great service, hut even effect a cure in cases of dyspepsia, phthiseis, scrofula, and goiter. Such bread is spoken of as being very good, and keeping a long time fresh. The salt is just snfficient to flavor it properly.

Water Troubles on Carson River.

The water in the Carson river is so low thst the principsl mills are now unsble to run more thsn sbout hslf their cspscity. The men engsged in the wood trsde are also in trouble. They have lying in the river, at a point above the Mexicsn dam, a lot of ahout 25,000 or 30,000 cords of wood, which they are unable to move while the Mexican dam is running. This being the csse, the woodmen sent for Ssm Jones, snperintendent of the Crown Point mine, which mines own the Mexican mill, snd represented their csse to him. Seeing that the woodmen are regularly stuck, Mr. Jones consented to shut the Mexican mill down for ten days, in order that the whole of the water in the river may be used in floating the straoded wood down to Empire City. In case all the wood shall not be got down during the ten dsys, Mr. Lyman, superintendent of the Mexican mill, will run that remaining down throagh the large ditch lesding to the mill. The wood drive this season amoanted to 180,000 cords, the lsrgest ever put into the river. There being an unnsual quantity of snow on the mountains, it was thought that there woald not be the slightest tronble ahoat water this year, but when the banks of snow began to disappear they all went at once. The mountains being very extensively denuded of timber, there is nothing to protect the snow, and it lasts bnt a short time once it hegins to melt. Next year, or any year hereafter, ia case there shall he a light fall of snow in the mountaias, it is likely that the mills will be obliged to begin to shut down some portion of their machinery as early as the middle of July. This would donbtless have been the case this sesson, but for the unasually heavy fall of snow last winter. This beiag the situstion, it will be necessary either to pat steam-eagines into the principal mills or to constract large reservoirs in which to hold back a store of water in nse in the dry season. For all interests the latter plan would be much the best. By having at commsnd aa ample supply of water the river may be kept at such a stage thst those engaged in the wood trade will be able to float their wood to any poiat on the river without difficulty. It will also be hetter for that section of the country through which the river flows that a goodly volume of water should roll through its channel than thst it should be allowed to dwiadle away aud dry np. There are a great number of places at the head of Carson river and its tributaries where reservoirs may be easily and chesply huilt—plsces where by putting in low and short dsms at the outlets of grest flats, lakes and valleys, vast areas may be flooded. A few of the places where snch reservoirs may be built at uo great expense are the following: On the East Fork, Wolfe creek, and Fish Fall valleys; ou the Middle Fork, at Pleasant valley, and the Summit lake; on the West Fork, at the Red lakes, aud the lake in Charity valley. Of these places Wolf creek ranch, containing 2,000 acres, 1,200 acres oaa be flooded to an average depth of 15 feet; Pleasant valley, 1,600 acres, can be flooded to an average depth of 12 feet; Sammit lake, 600 acres, can he increased to 1,000 acres, with an average depth of 10 feet. There are msny other plsces quite as available as those meationed. The entire cost of damming these places and getting a full supply of water for the months of August, September and October would probably not exceed the loss entailed by the shutting down of the mills for a siagle season.—*Territorial Enterprise.*

Julia Mine.

Enlarging the main shsft of this miae is now completed to within 80 feet of the surface. When this is finished this will give a fine three-compartmeat working shaft 1,100 feet in depth. The engine has a 22-inch cylinder, 36-inch stroke, an 8-iach msin shaft, and possesses a capacity of 200-horse-power. As soon as the engine is in good rnnniag order, the water will be drained from the shaft and work will be resumed on the 1,000-ft. level. At the time of the suspension of work on this level, on account of inability of the machinery to keep down the flow of water and do the necessary hoistiag, the east cross-cut from the south drift on the 1,000-ft. level had encountered some fine prospects of ore, sufficient to iadnce the erection of the present new powerful hoisting and pnmping machinery. The new pumping engine has a 14-ft. fly-wheel, an 11-ft. driving wheel and a 2½-ft. pinion, and a capacity of 180 horse-power. Four of the plunger pumpe are now on the ground, ready to be pat in as soon as the shafc is completed. These pumps will be placed at stations 250 ft. apart in the shaft, and with an 8-iach column will be sufficient to drain with ease all the water that is likely to be encountered. The sole plates, fly-wheel, driving wheels, pump columns, and much of the other pumping machiaery, are already at the mine and more being received daily. The bed sills for the machinery and the pump rods are being manafactured out of the hest possible quality of red sprace, brought from Datch Flat, California. The excavation for the foundation of the pumping engine and the bob-pit of the pump is making fine progress, and when everything is once more in good working trim, good results may well be looked for.—*Gold Hill News.*

THE engraved cylinders for calico priuting are required to be of pure copper, and their unsoundaess, when cast in the usual way, was found to be so serious an evil that it gave rise to casting the metal under pressure.

The Fastest Time Ever Made on the Hudson River Railroad.

William H. Vanderbilt and family and the President of the New Haven railrosd and family reached Albany from Nisgara Falls in a specisl train of two dining-room cars about two o'clock yesterdsy afternoon. We do not know what time they msde on the New York Central, hnt at 3 P. M. locomotive No. 26, James Paul, engineer, hitched on the trsin at West Albany and started it for New York. Their coming hsd been telegraphed ahead, and there was clear sailing. It took about 10 minntes to do the slow traveliog over the bridge and down along the yards, and then Jimmy "pulled her oot," and awsy flew the train like a meteor. At Coxsackie and other points people gazed with terror as the cars thnndered by at the rate of a mile a minute. They could hardly be seen, but looked like one piece of wood and iron rashing through the air. There was a slight slow-up at Hadson, and in three minutes after the train dsshed by Catskill ststion with a "whir!" that wse astonishing. Gravel-stones, dust and dry sticks whirled along in the wake of the lightning-train in clouds.

Three minutes were consnmed ia Tivoli for wster, and ooce more "old 26" was measnriog iron at the rate of a mile s minute till Rhinebeck was reached. There they were repairing the telegraph wire, and part of it was aoross the trsck. Five minutes were consnmed there, when the wire was cut and the train dashed on again, the cars rocking on the rails like a cradle, and the dust flying in every direction. Over bridges and trestle-work, around curves, through deep cots it rattled away, rushing over Fallkill bridge into thie ststion at a 40-mile-an-hour gait, having made Poaghkeepsie in one hoar aud 38 minutes from Albany, and deducting 18 minutes for stops, the actual running time was one honr and 20 minntes—the best time ever made on the Hudson river railroad. —*Poughkeepsie Eagle, Sept. 6th.*

A RICH CINNABAR DISTRICT.—The Devil's caaon is a deep gorge in the Geyser mountains, so called from its great depth and the wildness of the sarrounding scenery. Its walls now echo the sound of the prospector's hammer, snd the priuts of his industrious footsteps may be seen in this lonesome retreat, besides that of its heretofore undisputed possessor, the grizzly. In the head of this wild gorge, just where the mountain gave way in the convulsion of natare which split the hills, the Oakland mine is situated, many hnndred feet below the summit of the snrroundiog mountains. A portion of the ledge seems to have washed down the caaon, which is several miles in length. The bowlders along the stream contain cinnabar, some very rich. A section of the bed of the creek hae been located ss a mine solely for this loose rock, of which there sre thousands of tons. We visited the locality hy request, and there we found a miner's cabin. Its occupsnt, Fred Salters, put a blast into one of the loose bowlders, in the bed of the creek. The shattered rock revealed some of the richest cinnabsr we have ever seen. Mr. Salters had piles of it hroken and ready for a farnace, along the stream, procured in the same way. This mine is called the Illinois. Adjoioing the Oskland mine is the Geyser. Its massive outorop forms a portion of the northera wall of the caaon. From these two ledges the immense amount of float in the bed of the stream originally came. It indicates that there is an unlimited sapply in the mother lodes from whence these hage cinnabar bowlders were torn.—*Santa Rosa Democrat.*

SONOMA AS A MINING COUNTY.—Among the chief attractions at the Sonoma and Marin Fair was a large and valuable cabinet of minerals, exhibited by R. Thompson, of the Santa Rosa *Democrat.* The collection embraces about 200 specimens, nearly all of which were obtained in Sonoma county. There were shown samples of qaicksilver from the various mines, some of the large pieces of ore containing from 40 to 60 per cent. of pure metal. One specimen from the Oakland miue, weighing about 40 pounds, is nesrly half quicksilver, and contains about $25 worth of metal. There are also specimens of gold and silver-bearing quartz, coal, chrome, iron, copper, agate and other metals. The Petalnma *Argus* says: The great richness and extent of our quicksilver mines have ceased to be a matter of douht—they are demonstrated facts. It is the opinion of Mr. Thompson aad others qaalified to judge that they are not only the richest in Califoraia, but among the moet extensive and valuable in the world. All who have examined Mr. Thompson's collection agree with us that Sonoma is entitled to be called a mining oounty.

WASHINGTON & CREOLE.—The present appearance and prospects of the Washington & Creole mine are very flattering. Yeterday we eaw in Wells, Fargo & Co.'e express office seven bars of a total valne of about $8,000, which was the prodact of about 70 tons of ore. Bullion enough to make them more bars worth $3,000 is now in the retort. Mr. Tarpey, the active and vigilant superintendent, informs us that dnring the present month, at least $15,000 will be shipped from the mine, with every prospect of a continuance of a like yield. This is good newe, though not surprising to ns, for we have never for a moment faltered in our belief, that the mines of Pioche will be as profitable as ever they were, and perhaps more so. —*Pioche Record.*

SCIENTIFIC PROGRESS.

Effect of Carbon on Iron.

A correspondent of the *Iron Age* writes to that paper as follows: The molecules of iron are pure, hnt the Iron of commerce is made up mostly of molecules of iron, and partly of molecules of other bodies, exerting the force of attraction in a greater or less degree. Therefore, every particle of foreign matter incorporated in the Iron, or taken from it, will change its resultant force. The tensile strength of iron is the equivelent of the resultant force of its physical structure; in other words, it will require no greater power to pull the structure apart then the sum of the molecular forces exerted in holding the molecules together. It is impossible to produce strictly pure iron, because its affinity for other matter is so great that it is beyond the skill of the metallurgist to exclude them entirely. The nearest approximation to pure iron thet has been atteined stands a tensile strain of about 50,000 lbs. to the square Inch. The consumers of iron demand a quality which will resist a strain equal to 60,000 lbs. to the square inch. Therefore the metallurgist, instead of endeavoring to purify the iron, incorporates such other metter with it as, by experience, he knows to exert the force of attraction in a greater degree, thus increasing the resultant force of the physical structure equivalent to the resistance of a tensile strain of 60,000 lbs. to the square inch. These additional elements, increasing the resultant force, draw the molecules closer together, and correspondingly reduce the size of the pores; hence, the purer the iron is the larger will be its pores. It ie conceived that carbon, in its atomic condition, is absorbed by the iron, and, without displacement of the physicsl structure, is retained within tnese pores in the form of monometric crystals. If this be so, then the purer the iron, the pores being larger, the greater the absorption of carbon may be; and the atomic force of attrection exerted by the atoms of carbon, in whatever degree they may be present, added to the molecular forces, will give the resultant force of the physical structnre, and a corresponding resistance to s tensile strein. It will be observed that the capacity of iron for the absorption of carbon is limited by the size of its pores. The exeot amount is not known, but it is less thsn 1 per cent. The usual range of carbon in steel is from 1-10 of 1 per cent. to 7-10 of 1 per cent.

There are other elementsry bodies which exert the force of attraction in a greater degree than iron, and which also oombioe with it, hut of all hodies known to exist, carbon exerts the force of ettraction in the most iutense degree. The diamond exhibits a structure in which the moleoales are drawn closer together than in any other matter yet discovered. The intensity of this force will be seen, when iron capable of resisting a tensile strain of 50,000 pounds, is converted into cast steel, with 5-10 of 1 per cent. of carbon, its tensile streagth is more than doubled; and with all desirable conditioas, with 7-10 of 1 per ceut. of carhou, a steel has been made capsble of resisting a tensile strsia of 180,000 pounds to the sqnare inch.

It is, therefore, within the ability of the metallurgist, by the aid of oarbon, to produce iron of any required degree of tensile strength, from 50,000 to 180,000 pounds to the squere iach. At 50,000 pounds the pores are the largest, and the molecules have the most room for undnlation; consequently, the iron is most ductile. As the force is increased, the molecules are drawu closer together, their undulations retarded, and ductility is displayed by elasticity, and es the maximum absorption has been attained, and the monometric crystallization complete, the structure is most dense, molecnlar undulations cease, and elasticity is lost in rigidity.

PROFESSOR BACHE, in his coset survey reports, mentioned that the tides of the United States sre divisible into three distinct classes. Those on the Atlentic coast are of the ordinary type, ebbing and flowing twice in 24 hours, and having but moderate differences in hight betweeu two succossive high or low waters, one occurring before and the other after noon. Those on the Pacifie coast also ebb and flow twice in 24 hours, but the morning end the evening tides vary considerable in hight. The intervals also between snocessive high and low waters may be very unequal. The irregularities are due to the moon's declination, as, when the moon travels fo the north of the equator, the vertex of the tide wave follows her, giving the highest point of one tide in the northern, and the highest point of the opposite tide iu the southern hemisphere. Hence, when the moon is in northern declination, the tide at any place in the northern hemisphere caused by her upper transit will be higher than that cansed by her lower transit. This vsriation in the hights is oslled the diurnsl irregularity, and hss a period of one lnnar day.

TEMPERATUBE OF THE EARTH.—Most of the observations have been made with self-registering thermometers, protected from pressure in the borings by being each enclosed in a hermetically sealed gloss tube. The average result thus far is that the temperature increased at the rate of 1° Fah. in every 50 ft. or 60 ft. in depth, bnt in one or two instances in different countries a oonsiderably slower rate was obtained.

Action of Water upon Lead Pipes.

Vincent says: In most great towns the water, after it passes from the mains of the water companies, is distributed to and through the houses of the inhabitants in lead pipes. Every now and then some wisecre who has learnt enough chemistry to know that plumbio oxide is sometimes formed by the nction of water on lead, creates a panic in the mind of the public hy pointing out this important fact. A great fuss is then made, and e great deal is said ahout the danger of this poison being overlooked until too late, from its being introduced iuto the human system in almost imperceptible quantities, there to accumulate until fatal consequences to health and strength are produced. Experiments are thereupon immediately directed to be made by the professional chemist of the locality, who accordingly proceeds to plunge pieces of pnre lead and lead pipe into the waters accused, into distilled water, fresh rain water, well water, etc. The results to he expected are well known, and have been well known for at least fifty yeare. The distilled water attacks and dissolves the lead with very great rapidity, rain water not quite so rapidly; the well weter hut seldom attacks it at all, and the river water, if it has traveled through any considerable distauce, never. Few people hsve had long experience of a country district without meeting with more or less of snch s panio.

The public mains aro manifestly above suepicion. It is only the short private branches which sre of lead. The result of most carefal experiments made upon the water from different sonrces, after passing through the lead branch into the house was, that in inhabited houses, that is to say where the water never remsins stationary in the leed hrsnch for more than ten to twelve hours, not a trace of lead could be discovered.

With regard to water which is allowed to remain for a considerahlo period in contact with lead, the amount of the action depends entirely on the purity of the water. In distilled wster the pretty tiny white scales of crystalline hydrated plumhic oxide form with very grest rapidity, if there is free access of air, and the hottom of the vessel coateining the lesd and water will speedily become covered with a white deposit. Freshly fallen rain wster acts nearly as well. Hence rain water for alimentary purposes should never be collected through leadeu gutters. On the other hend, however, infinitesimal the amount of lime salts in solntion may be, if they can be detected at all, the water in which they are found is positively free from all action as regards lead. Soft water dissolves lead, hard water preserves it untarnished. No other salts appear to preserve the lead so entirely free from oxide as do the salts of lime. Inasmuch, however, as it is impossible for water to percolate or pass over any considerable amount of soil without taking lime into solution, and this lime it is impossible wholly remove hy any means short of complete distillation; it follows that all river water may be conveyed with the most perfect security through lesd pipes without in any way interfering with its wholesomeness as a potable water.

GALVANIC ELECTRICITY WITHOUT CHEMICAL ACTION.—At a recent meeting of the Physical Society, Mr. Fleming showed his new battery, in which the metallic contact of dissimilar metals is entirely avoided. The arrangement consists of 36 test tubes of dilute nitric acid, and the same number of tubes of sodium pentasulphide, all well insulsted, alterneting with one another. But strips of alternate lesd and copper connect the neighboriug tubes; by which meaus the terminals are of similar metal, and a current of suffioieat intensity to violently affect a quantity galvanometer obtsined. The potential increases, as in the ordinary galvanic arrangement, with the number of cells employed, until 60 cells showed an electro-motive force exceeding that of the same number of Daniell's elements. In this new battery the acid lead is positive to copper, while in the sulphide it is negative. Mr. Fleming further showed how, by using the single fluid nitric acid, and the single metal iron, a similar battery could be construoted, provided one-half of each iron strip was rendered passive. This is au important discovery, for it seems to revive the theory that chemical action is not necessary in a galvanic apparatus to produce electricity. At all events it is of sufficient interest to merit the sound inquiry into its principles which physicists seem likely to make.

HEAT OF THE SUN.—Father Secchi has published in Rome the result of his investigations in the solar temperature, msde during last summer, and states thet his efforts were directed toward the determiuation of the relation of the solsr radiation with that of the electric light. The instrument used wss a thermoheliometer of the investigator's own invention, and the conclusion reached was that the radiation of the sun would be 96⅛ times that of the carbon points. If, therefore, the temperature of the surface of the latter is fixed at 5,432 degrees of Fahrenheit, a number not exaggerated, and supposing the radiation proportionsl to the temperature, we obtain for the potential temperature of the sun 540,848 degrees Fahrenheit.

AN inventor proposes to extract citric acid, tartaric ecid and alcohol from the temarinha plant, which is cut preferably when in a green state, aud is subjected to pressure to extrsot the juice therefrom, which is afterwards operated upon by the usual appliances or machinery by which citrio acid, tartario aoid and alcohol are generally made.

MECHANICAL PROGRESS.

Railway Inventions.

A novelty iu the way of recent railway inventions is an improved pneumatic station iudicator, which, at least, poesesses the merits of simplicity. There is a case containing a roller and a chein of name-plates. This roller is trned the width of one face et each station, to present the plates having names of the stations in front of the sight-opening; and the arrangement is such that the nsme-plate cannot be csrried beyond the point of showing the lest station on the route, in case the car should he run heyond its route on another section or division, and it is held ready for running back on its own ronte. Springs are employed to allow the roller to turn, in oase the mechanism for turning it is kept in operation efter passing beyond the terminal station, and to pull the roller back each time. The special valne of this plan is exhibited in case the car should get coupled in a train for a road or station to which it does not helong, which cars hsving annunciators for thet road, so that its annunciators would of necessity be coupled with the others, and thus have to be worked that the others might he, as is well understood in the msnagement of railroads.

Another invention of note in this line is s car-coupliag device, iatended to meet some of the difficulties existing in the arrangements at present employed. In this case the forward ends or faces of the bumper-heads are rounded off, being msde oblong or elliptical in their general form, and in the fsce of the bumper-heads is formed a high and nerrow opening, with straight ends and curved and concave sides. The coupling hook has in one end an eye to receive a holt, which passes through vertical slots in the sides of the bumper-hesds, to pivot the hook to said heads, the parts of these bolts thet pass through the slots being flattened, to prevent their turning and workiag their nnts loose. The holts may be raised or lowered to adjust the position of the hook to the hight of the adjacent car, and in the forward lower part of the mouths of the bumper-hesds there are inclined plates, for the beveled forward end of the hook to strike against and slide up ss the cars are run together.—*Railway Register*.

A NEW enterprise in gun-making is in progress at the Springfield armory, Mr. James Lee, of Milwankee, having secured from Congress at appropriation of $10,000 for the manufacture of guns upon his model, for experiment in the field. Mr. Lee's gun was before the small arms examiners in Springfield a year and a half ago, snd stood all the tests to the one of excessive cherges, when a piece of mechenicism hroke. Mr. Lee promptly remedied the difficulty, however, and taking his gun to Congress last winter so satisfied the Military Committee npon its merits as to secure from them an approprietion of $10,000 for its trial. The gun in question is of extraordinery simplicity in construction, heving only fourteen pieces in its meke-up. These few pieces sre so novel in arrangement thst seventeen patentable cisims are msde upon them. There are oaly one screw and two springs in the gun, which can be fired thirty-one times a minute. Mr. Lee considers it the strougest, simplest and safest gun in the world, and intends to patent it in Englend for competition with the Mertini-Henry rifle.

SPEAKING of the celebration of the Fourth of July in Philedelphia, the correspondent of the *Iron Age* says: The Girard Avenue bridge, the widest bridge in the world, and probably as well built as any, wss formally turned over to the city authorities and opened to the public. You have had several descriptions of this bridge, but I add again dimensions and cost: Total length, 1,000 ft.; total width, 100 ft.; number and size of spans, two of 137 and three of 197 ft.; length of sidewalk, 865 ft.; number of piers, 4; abutments, 2; width of roadway, 67½ ft.; width of each sidewalk, 16½ ft.; greatest hight from roadway to rock fouudation, 85 ft.; number of square feet of surface, 100,000; cost per foot, $4.86. The totsl cost wes $1,404,445, and, although less than a quarter of a mile long, the bridge contains as much msterial as is in a mile and a half of siagle-track railroad bridge of similar spans. A very attractive feature of the work is that each kind of material used is allowed to show whst it is, iron not being treated to resemble stone, and color beiag applied only to distinguish parts.

TWO CENTUBIES HENCE.—The following fancy picture of what may be familiar enough two centuries hence is no more improbable on the fsce of it thau our railways, electric telegraphs and the like, wonld have seemed a century ago:

"Scene—Library in the house of an elderly gent, somewhere in Australia. Old gent telegraphs to the kitchen, and waiter ascends in a halloon. *Old Gent*: John, fly over to Calcutta, and tell Mr. Johnson that I shall be very happy to have him sup with me. Never mind your coat now, but go. John leaves, and at the end of five minntes returns. *John:* Mr. Johnson says he will come; he has got to go to St. Petersburg for a moment and then he will be here. *Old Gent:* Very well, John. Now start the machine for setting the table, and telegraph to mp wife's room, and tell her that Mr. Johnson is ooming; then brush up my balloon, for I have an engagement in London at 12 o'clock. John flies, and the old gentleman runs over to the West Indies to buy a fresh orange.

French Saw-Making.

The Paris makers have almost a monopoly in the making of ribbon-saws, and of lete years they have given much attention to the production of all kinds of saws and other articles made of sheet steel. Among others, M. Dogonjon, who has steamworks at Paris, hss patented a number of improved modes of mennfac ure. The bledes, after heing rolled cold several times, in order to render the grain close and the metal homogeneous, are heated in special fnraces, from which the air is carefully excinded, and when at the proper temperatnre are plunged in a hsth of Colza oil; this is done in a dark chamber. The tempering is effected with the aid of machines, which cause the hlades to pass between cast-iron plates hested to a fixed temperatare, according to the nature of the article to he prodaced. The teeth of the saws are cnt by machinery, which requires only laborere to attend them. Since the war, which deprived the establishment of its hest men, M. Dugoujon hae effected the planishing and graining of circular end other saws aud meuy similar articles by mschinery, and, it is seid, with great advantege with respect to regularity snd stiffuess. Another introduction is the mechanical reduction of the joints of ribhon-raws. The breakiag of the joint is the only inaonvenience ahout this useful instrument. The workman, in redncing the welded part, by means of the file, scarcely ever left it of exactly the same thickness es the rest of the hlade; thus it either oreated extra friction, or was liahle to break. By the new method the redaction is made hy grinding, iastesd of filing, and as that is effected longitudinelly, instead of across the hlade, the thickaess is rendered perfectly uuiform. This invention is ssid to save 60 per cent. in wages hesides the cost of files.—*Iron*.

AN INGENIOUS INVENTION.—Mr. Atkins, Birmingham, (Eng.) has invented a process which admits of the filliug of articles of brass with molten iron. The balance weights for chandeliers, pillars, columns snd imperiel weights may be made, advantsge being taken of this process, at a much diminished cost. It is simply necessry to immerse the brass shells in water, and the molten iron is theu poured in. The shell can not, of conrse, attein a higher temperature than 212°, the boiling point of water, while the tempersture of its contents may he ahout 3,000°. In making imperial weights the shells are imbedded in iron filings, the high conducting power of which is thus turned to account. This process, simple though it be, is, from a commercial point of view, one of great importaace, as will he resdily nnderstead.

RAILWAYS IN AMERICA.—The railwsy journals believe that in the year 1880 there will he 100,000 miles of rsilroad in the Republic. The total has slready reached 70,000 miles, and as the iacrease in prosperous yeers has been as high as 13,000 miles, it would sttain the number stated in less thsn three years if the country could at once regain the rate of constraction to which the panic of last autumn gave a check. Even taking the increase of 1873 as an average, the 100,000 could be passed in four years. The railroad mileage has doubled in 10 years. Should this progress coutinue the total mileage in 1884 would be 140,000.

A STEEL yacht has been built in Philadelphis, with expectations of going 26 miles per hour. The result at the first trial was 21 miles. Her plates are 1-16 inch thick, with a bow little less than rezor sharpuess. The frames are steel, the aagles being only 1-14 inch thiok and 14 iaches apert. All the seams are double riveted. Her locomotive boiler has been tested to a pressure of 200 pounds to the square inch. Her cylinders ere 10 inches in diameter and 10 inches in stroke. The screw is four feet in diameter with seven feet pitch. This little creft is termed the Aerolite, and is destined for Egypt.

AN eagine on the New Jersey Midlaud road has been fitted with a smoke-burning arrangement in the fire-box. On one of the early trips of the engine as the fireman opened the furnece door to throw in a shovelfal of coel, the gas burst ont with such volume snd force as to throw him entirely off the engiue. In falliug, he struck on his hesd in a culvert and was killed. Another fireman was put on in the dead man's place, and in a short time he had his face terribly burned. One would suppose it would now be rather difficult to find a fireman for that engine.

FIRST LOCOMOTIVE IN AMERICA.—The first locomotive that ran on a railroed on the American continent was imported from England by the Delaware and Hudson Canal Co.; was shipped from Liverpool April 3d, 1829, and arrived in New York the 17th of May, 1829; was sent up the river to Rondout; from thence was transported by canal and arrived at Honesdale, and on the 8th of Auguet made the trial trip. This locomotive wes built at Stoutbridge, England, and the boiler is now in use at Carbondale, Pennsylvania.

BEAM END PROTECTOR.—A new invention relatee to a sheet-tin casing for the ends of wooden beems as a protection against the influence of dampuess or destruction by fire. The casing covers the beam end and so much of the contiguous portion as enters the mortise in the hrick or stone wall, and it may also be made of sufficient leugth to project a short distauce from the side of the wall.

Weekly Variations in Stocks.

(Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.)

Mining Stocks.

The stock market has been in an excited state during the past week, prices generally being high. Transactions have been both large and numerous in the Board, with an upward tendency in prices. News from the various mines continnee good, although with regard to the Comstocks the scarcity of water in Carson river has caused the shutting down of so much machinery in the mille that the bullion yield for September cannot he otherwise than light. How the Belcher and Crown Point will manage to pay their usnal dividends remains to be seen, as nearly all the mills of these companies are on the river. The Consolidated Virginia will not he affected, as all of their mills are driven hy steam. The minee there, according to the *Enterprise*, are looking exceedingly well, and the newly developed ore bodies are all holding out fully as well as could he expected, while in several instances they have far exceeded the expectations of even the most sanguine. Great activity prevails in all the mines, and soon all will be eo well ventilated that it will be hard to find any more work in that line upon which to employ the workmen. There will then no longer he any good excuse for delaying the work of exploration and development in the levels and drifts now closed.

The mining companies paid in September $1,077,200 as dividends, against the sum of $1,277,320 last year. Those last month were as follows: Belcher, $4 per share, $416,000; Crown Point, $3 per share, $300,000; Consolidated Virginia, $3 per share, $324,000; Chariot Mill (San Diego), 40 cente per share, $12,000; Redington Quicksilver, $20 per ehare, $20,000. Thie is exclusive of the coal companies. The mining companies paid last month in the aggregate $1,077,200, while other local incorporations only paid altogether $320,200. The monthly mining dividende of late have been ae large as was formerly disbnrsed in a quarter or eix months. The minee paying dividends last Septemher were Belcher, $520,000; Crown Point, 300,000; Raymond & Ely, $90,000; Eureka Consolidated, $50,000; Eureka, $20,000; Golden Chariot, $30,000; Minneeota, $30,000; and K K Cousolidated, $12,000.

Sewer Mining.—Every miner knowe that quicksilver is high and scarce, but few would snppose that it would pay to work sewers to get it: Still, men are now actually engaged in cleaning the city sewers at Austin, Nevada, for the purpose of extracting therefrom the quicksilver and amalgam which has passed down with the tailings from the Manhattan mill. The Reese River *Reveille* saye that two men are now at work on the sewer, and that the daily result of their labors ie abont four pounds of quicksilver and amalgam. At present prices of quicksilver these men will make good wages at that rate, especially if there is much amalgam.

Burnt River and Elk Creek.—From Z. I. Hazeltine, of Grant county, Oregon, the *Mountaineer* learns the following items of news from that eection of the State: The Burnt River gold mining distriot has turned out very well this season. Meesrs. Carpenter, Bruusen & Farmer cleaned up ahout $12,000 from their olaim for four months' work. The other claime have also paid well. The Elk Creek quartz minee are paying well. The Cahel mine is tarning ont splendid.

The water in the Carson river is getting lower, and eome of the mills will eoon be compelled to shut down. The Brunswick mill is only running to one-third its capacity. The river is still full of wood from Empire City up a distance of ten miles. A large force is employed in getting it ont, but their work will not be completed before the middle of next month.

The "Spread Mieery" lode, in epite of its name, hae proved itself to be one of the best mines in the Mosquito district, South Park, Colorado.

The Flagstaff mine, Little Cottonwood, Utah, employs from 60 to 100 men, and ships about 50 tone of ore per day.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

Santa Inez Quicksilver Mining Co.—Sept. 21. Location, Santa Inez valley, Santa Barbara county. Directors: Soiomon Heydenfeldt, Jessie S. Hall, Harvey S. Brown, W. H. High and Joseph Craig. Capital stock, $3,000,000, in shares of $100 each.

Scott Quicksilver Mining Co.—Sept. 21. Location: Santa Inez valley. Directors: George D. Roberts, R. R. Craig, C. B. Buckingham, Walter M. Rockwell and A. L. Warner. Capital stock, $3,000,000, in shares of $100 each.

Agra Mountain Tunnel and Mining Co.—Sept. 21. Location: Agra mining district, El Dorado county, Cal. Directors: Isaac Tahor, J. H. Harmon, E. O. Boohar, A. C. Hendley and N. B. Hitchcock. Capital stock, $2,000,000, in shares of $20 each.

Cosmopolitan Mining Co.—Sept. 27. Location: Story county, Nevada. Directors: A. K. P. Harmon, Robert Sherwood, H. C. Kibbe, A. P. Cox and W. E. Hall. Capital stock, $5,000,000, in 50,000 shares.

Hog's Back Quicksilver Mining Co.—Sept. 28. Location: Sonoma county. Trustees: H. L. Norton, D. H. Whittemore, James M. Gitchell, Bradburn Sanborn and S. C. Duncan. Capital stock, $1,000,000, in 100,000 shares.

American Flat South Mining Co.—Sept. 30. Location: State of Nevada. Directors: E. Strother, W. B. Boyden, S. Heydenfeldt, E. L. Stern and A. K. Grim. Capital stock, $2,400,000.

Gualala Mining Co.—Sept. 30. Location: Sonoma county. Directors: James R. Martin, J. H. Struckmeyer, George W. Deke, E. Higgins and John R. Martin. Capital stock, $3,000,000.

San Francisco Land, Building and Railroad Co.—Sept. 30. The purposes for which it is formed are to improve lands in such a manner as may be desired; to build, manage or lease a street railroad; to erect buildings and otherwise improve real estate; to secure loans by mortgage or other securities, etc. The street railroad is intended to coromence at the intersection of Mission and 26th streets, running thence along Mission street and tha county road to a point directly opposite and west of Holly Park, at the intersection of the county road with Crescent avenue; thence along Crescent avenue and over private property (with the consent of the owners), or through such streets as may now or hereafter be laid out, to a point on Silver avenue, near its intersection with Amherst street as may be most practicable; thence across or along Silver avenue and through the most practicable streets of the "University Mound Survey," to Henry street; thenca along Henry street to the San Bruno road; and thence easterly along the most practicable street or streets to a point on Railroad avenue, at or neer the present terminus of the Potrero and Bay View railroad. The estimated length of the railroad is four miles. Directors: Hiram Rosekrans, E. M. Hall, Hill Beachy, Thomas B. Lewis, N. P. Cole, W. H. Duryea, W. E. Boone, J. L. Browne, Joseph B. Haggin, J. M. Buffington and G. Howard Thompson. Capital stock, $10,000,000, divided into 100,000 shares of $100 each.

The Orleans Mining Co. have filed with the County Clerk a copy of the written consent of a majority of the shareholders that the principal place of business of the company may he removed from Grass Valley to San Francisco.

Increase of Capital Stock.—A certificate of the increase of the capital stock of the Best & Belcher mining company from $2,240,000 to $10,080,000 has been filed with the County Clerk.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR COUNTY.

Mines about Volcano. — *Ledger*, Sept. 26: We are pleased to learn that the placer mines, at and in the vicinity of Volcano, are looking very well, indeed. Water is not abundant, but where a fair supply can be had the mines are yielding very well.

The Union Flat claims recently sold by Thos. Sorocco to Messrs. Booth & Co., of San Francisco, we learn, are proving to he very valuable, the yield from the washings unexpectedly large, with ground which it will require years to exhanst. The claims were purchaeed for $16,000, and we are informed the fortunate purchaers could now sell for $50,000.

The Alpine.—Sinking in the main shaft in the Alpine is still progressing, having reached a depth of over 500 ft. The ore in the shaft is of an excellent quality.

Volunteer Mine.—Very rich rock hae been struck in the Volunteer mine, lying a short distance east of the Kennedy. The ore is represented as being remarkably rich.

CALAVERAS COUNTY.

Slate in Calaveras.—*Citizen*, Sept 25: It is a fact that slate quarries exist in the neighborhood of Copperopolis hut up to the present time little has been done to develop them. In Europe and some parts of the United States, slate quarries are often considered valnable and there is no reneon to doubt that if a good quality of slate can be developed here it will pay.

EL DORADO COUNTY.

Items.—*Republican*, Sept. 26: The proprietors of the soapstone gold bearing ledge are now sinking from the end of their tunnel, and talk as though they were well pleased with the appearance of the mine. Capt. Woodworth's mill, on the Young Harmon, wae etarted up yesterday morning. Without donbt, the best qnartz ledge in thie vicinity, according to development, is the Gross ledge, on the east side of Big cañon. The eeveral crushings made have all gone over $100 to the ton. Another crnshing of rock from that olaim, consisting of 14 tons produced $1,704.21 this week.

Taylor Mine.—Cor. *Mountain Democrat*, Sept. 26: The incline runs at an angle of about 60 degrees and is timbered up in a snbetantial and workmaulike manner. From the bottom of the incline drifte have been and are being run along the ledge. To the north the drift is in about 109 ft. For the entire distance the ledge continues unbroken from 10 in. to 3 ft. in width, and where it can he examined between the timbers shows gold, and in some spots very rich. At the end of the drift the ledge wae about 10 in. and wae widening ont. The coa-

tract to extend this drift has been completed, and the day that I was there the company were running it by day labor. The walls were very fine and regular, and between the foot wall and ledge was a gouge, varying in thickness but always present and a great advantage in working, besides being a good indication of a regular ledge. They have out 200 tons of good milling rock. One pile of 80 tons Mr. Gibbs assured me would yield $20 to the ton. There is a 5-stamp battery on the mine, but it is too small to be profitable. They are now talking of putting up a 20-stamp mill.

KLAMATH COUNTY.

PAYING WELL.—*Yreka Union*, Sept. 26: From Ed. Mathewson we learn that the Oak Grove claim, and the Adam Sel's claim, on McAdam's creek are both paying well. They are deep drifting claims and do not suffer for want of water, as do many claims in other parts of the county.

MINES.—The claim of Pippin & Offield at Hamburg bar is said to be paying well. Other claims, on the bar and in the vicinity are also yielding satisfactory. Kettlewood & Andrews have got into their claim in the Klamath just below the mouth of Scott river and have begun to take out money. It is expected that they will do well this year.

CLAIMS ON OAK BAR.—Gregory, Ship & Co. took out of their claim on Oak bar on Friday the 18th, 10¼ ounces; on Saturday the 19th, 12 ounces, and on Monday last 8 ounces. Nothing later has been heard. Clever, Caldwell & Co. took out of their claim on Monday last, 25 ounces. Collins, Pallen & Co. whose claim has been paying from 10 to 12 ounces a day are now working high bed-rock. Varney, Swan & Little are working high bed-rock, but are making wages. Delaney & Co. who some time ago got a good prospect in their claim on Rebel bar, have since stripped off a large cut and are now ready to commence washing up. Eli Miller and the Mott Bros., opposite the mouth of Horse creek have been stripping and are about ready to wash up. The prospects on that part of the Klamath are remarkably favorable for a good season's work.

FORKS OF SALMON.—Mining matters are somewhat dull in this vicinity at present, owing to the scarcity of water in the small gulches, on which many of the miners depend for a supply.

MONTEREY COUNTY.

SILVER.—*Democrat*, Sept. 26: We hear vague reports of the discovery of silver bearing rocks at various points, in the mountains east and west of the Soledad station. There has been considerable preparation to prospect the supposed mines.

NAPA COUNTY.

QUICKSILVER.—*Register*, Sept. 26: 130 flasks quicksilver from the Redington, go down tonight by the express.

THE OAKVILLE MINE.—We understand that the owners of the Oakville quicksilver mine have a meeting in San Francisco to-day, with a view to settling up their affairs to resume active operations.

OUR MINES.—The fever does not seem to abate one iota. Everybody and his neighbor is getting rich—on paper, and don't seem to care a cent for any one. Every evening about sundown you may see people coming in from off the hills in all directions, with their pockets full of rocks, as happy as a clam at high water. The whole of the mountain north and east of Calistoga has been located, from Mt. St. Helena to Walker's cañon, a distance of 12 miles in length. A town has been, or is being surveyed near the Calistoga mine, to be called Borlandville. A town will spring up on the side of old Mt. St. Helena.

THE SULPHUR SPRING MINE.—*Reporter*, Sept. 26: Quicksilver mining in this county is by no means confined to that portion of country that lies above Calistoga. Mines showing evident indications of wealth in cinnabar are known to exist in the ranges of hills that skirt our valley on either side. Among the most prominent of these is the mine above mentioned, situated on the Smith & Calderwood ranch, near Foss valley.

CALISTOGA SILVER MINE.—This mine is indeed, "an object of interest," and all attention is given to any item of news that can be secured about it. So far about 20 tons of ore have been crushed. We are praying for good news of the clean-up next week, as Napa county is deeply interested in the future of this mine.

NEVADA COUNTY.

IDAHO.—*Transcript*, Sept. 27: The new pump of the Idaho Co. promises to be one of the best ever put up in California. The foundation is already nearly finished.

A COAL mine has been discovered above Boca. The vein is 18 in. thick, and the coal has been tested and burns freely. Nevada county can boast of the best gravel and quartz mines in the State, and the day is not far distant when silver, coal and other kinds of mines will make a good showing.

RICH STRIKE IN THE PROVIDENCE.—Very rich rock has lately been struck in the Providence mine, and the point at which it is found the ledge is as wide as usual—that is between 40 and 50 ft. Free gold is abundant, and there is every indication of its continuing as rich to another level. What the probable value of a mine is where there is a body of ore over 40 ft. in thickness, and the most of it filled with sulphurets and free gold, we leave for our readers to determine. Experienced miners have for some time regarded the Providence as one of the best mines in the State.

THE IDAHO SHOP.—Foothill *Tidings*, Sept. 26: Heavy forging is now being done at the shops of the Idaho mine near this place. In constructing the new pumping works for this mine it becomes necessary to use what is known as a V Bob. These are usually about here, made of wood, but to conform to the general character for solidity and permanency of the balance of the work, it was decided to have this of iron. It was a pretty heavy bit of forging for a country shop—the iron in it weighing over 3,000 pounds—and such work for the Comstock mine is done in San Francisco, but it was successfully accomplished this week and superintendent Coleman is engaged in drawing plans for the Balanco Boh for the same works, which will, it is said, contain at least three tons of iron. The Idaho shop contains five forge fires and can boast of some of the best smiths in the country. This heavy forging is in charge of Mr. Samuel Tyrrell.

Good reports are circulating this week in regard to the underground developments of the Empire mine.

THE Omaha incline is now down over 140 ft. and the ledge is of good size and shows well in the precious metal.

PLACER COUNTY.

ST. PATRICK.—Auburn *Herald*, Sept. 26: The St. Patrick quartz mill is pounding away, regularly, some of the time on custom rock, but mostly on rock from the company's own mine—the Bellevue and Crater. The rock now being crushed from the Crater will go at least $25.

At the Crater mine they are doing nothing in the main shaft. At the bottom of shaft No. 3 the foreman tells us they have some splendid rock. The works on the Crater are very fine, and are run in good shape, but business does not seem as lively there, as it did some time since.

AUBURN MINE.—At the time the Auburn mine was sold by the sheriff, Thos. H. Gordon and J. B. Hobson bought what rock there was on the dump. Some time ago they crushed the best of this rock, and got from it $25 per ton. They have, recently, had the balance crushed, amounting to 150 tons, and cleaned up about $1,650 as the result. Wherefore, the mine is not worked?

THE Booth mine is looking very well in the drifts. As fine a specimen as we ever saw outside a show window was taken from the east drift last week. The drift east and west is in about 175 feet, and a force of men are at work at each end, driving it further. In the face of the west drift the ledge is about 5 ft. thick, and every inch the rock pays on an average of say $22 per ton. In the face of the east drift the ledge is not quite so wide, but as yet the rock is richer. Since the mine became incorporated the working force has been increased. Besides drifting, as we said above, both ways, they are at the same time sinking.

CLEAN-UP.—From a crushing of 152 tons of rock from the Booth mine (formerly Orleans) they cleaned up, last Monday, 14½ pounds of gold, or a little over $3,500. This is over $23 per ton, and is considered very good for average rock.

BELLEVUE.—At the Bellevue proper they are at work drifting from the new shaft, and expect every day to strike the ledge. From shafts 5 and 6 they are taking out milling ore every day.

IN the Penryn quarries, owned mostly by Mr. G. Griffith, there are now 100 men employed; 100 at Rocklin, makes 200 men employed in this county in the granite business, and the quarries are not fairly opened yet.

PLUMAS COUNTY.

CARRIBOO.—Plumas *National*, Sept. 26: Most of the miners at this camp are doing well this summer. Orton & Keep are washing surface gravel and making $20 per day. Carr & Ballou have struck splendid prospects in their tunnel on the hill above Carriboo bridge. Trucks & Gardner are lying on the oars, evidently well satisfied with their summer's work on the old Hickman claim. They propose to run a new tunnel on the mine.

MINING ITEMS.—The immense mining operations on the North Fork and East Branch will have the effect of opening a wagon road down the river to Oroville. The Maxwell Mining Co. are extending the survey of their ditch down Spanish creek, and will commence work on it at once. Steam drills are being used by the North Fork Co. in their blasting operations, and are said to work splendidly. The mill of Lawrence & Young is to be put up on Barker Hill, near Dutch Hill. The North Fork Co. expect to have their ditch and pipe completed in the next 40 days. Several of the miners of Carriboo have been making big wages this summer. An old man who mined on Taylor creek, near this valley, in '52, has recently returned and will commence work there again shortly. The new ditch enterprise of the East Branch Ditch & Mining Co. is to be vigorously prosecuted. Surveyor Keddie has made a survey of part of the line of the ditch, a force of men are already at work, and more will be put on in a short time.

SAN BERNARDINO COUNTY.

PANAMINT.—*Argus*, Sept. 21: We are informed that parties largely interested in Panamint have made arrangements to have large amounts of ore hauled direct from the mines to Wilmington, and then shipped by the P. M. S. S. Co. to Swansea, in England. Teams from this valley are now already engaged, and in a short time will be at work. We do not know the particulars for the arrangements, but enough is known to warrant us in believing that our recent wealthy, enterprising and influential visitors mean business, and that incalculable advantages will accrue to San Bernardino, not alone in bringing money into circulation, but by the prominence which the county acquires.

SAN LUIS OBISPO COUNTY.

MINING SALE.—*Tribune*, Sept. 26: Theo. Sherman, of Cambria, has sold 75 ft. in the North Star quicksilver mining company, for $7 per ft. This company has a very promising prospect. It is a consolidation of several mining companies, and their lode is considered to be very rich. They will soon incorporate, and at once commence active operations.

SUTTER COUNTY.

COAL.—*Banner*, Sept. 16: Now is a good time to tunnel in the Buttes. A number of narrow seams of coal have been found, and it is thought they lead to an immense bed of coal. Some think boring would be a better way of prospecting than tunneling. The gas well bored a few years ago in prospecting for coal oil in the same locality, continues to emit a stream of carbon or coal gas, which burns freely.

TRINITY COUNTY.

STRUCK IT RICH.—Trinity *Journal*, Sept. 26: Pete Van Marte tells us that his boys are sinking down on the quartz lodge which they discovered on Mule creek a year ago last spring. They are down 30 feet, rich rock has been taken out and the ledge improves.

GREAT PREPARATIONS.—Mr. Jas. A. Johnston, of Indian creek, has purchased the interests of his former partners in the mine there, and is now engaged in fitting up the claim in the most improved manner. A 22-inch pipe will carry the water to the bedrock, where a distributor will be placed, and from this two 15-inch pipes will be taken and two Little Giants run.

THE BEST YET.—The past winter, John H. Smith and Thomas Baker have been engaged in opening a placer mine on Eastman's creek, above Lewiston. They have a 3-ft. flume, about a quarter of a mile long. The 20 head boxes were run down last week and the first bucketful of dirt taken up contained 20 pounds of gold dust, or about $4,500. The gold is heavy and a large proportion of it remains on the bedrock and in the ditches. This is the best bucketful of dirt ever taken up in the county, we believe. Smith says he don't want to sell, and wouldn't have a better claim than the one himself and partner have just opened.

TUOLUMNE COUNTY.

GRAVEL DIGGINGS.—*Independent*, Sept. 26: Some miners design to start in, the coming winter, to wash the gravel bed near Allen's ranch. They will use the hydraulic and sluice. Gravel washing promises to become a prominent feature in Tuolumne county mining.

THE small gulches near Burns' ranch will pay $2 and $3 per day, with plenty of water.

WE saw the superintendent of the Omega Table mountain gravel company the other day, and he states that the developments in the Alphe justifies the above named company to start in very soon to develop their mine.

GRAVEL CLAIM.—Burns & Connelly contemplate starting a hydraulic on their gravel claim near Marlo's, the present season. The gravel yields a good prospect.

Nevada.

WASHOE DISTRICT.

SIERRA NEVADA.—*Territorial Enterprise*, Sept. 26: There is a steady increase in the influx of water in the main shaft, but the pump easily handles it. The rock in the bottom of the shaft is of a more favorable character for sinking, and better progress in sinking is being made. The rock is becoming harder, which saves the labor of spiling. At the Sacramento chimney there appears to have been a mistake made in the survey, and the upraise has not yet connected with the drift above. At the old mine there is no change worthy of note. The usual quantity and quality of ore is being extracted and crushed in the mill of the company.

CALIFORNIA.—The two north drifts from the 1,400 and 1,500-ft. levels of the Cons. Virginia, that are advancing through this raise to connect with the two corresponding south drifts from the Ophir, are making satisfactory headway.

CONS. VIRGINIA.—The work of cutting out the 1,500-ft. station and enlarging the drifts for the purpose of more advantageously developing that level, is progressing well. The ore breasts on the 1,200, 1,300 and 1,490-ft. levels are yielding the usual quantity of rich ore, while developments on the 1,500-ft. level promise even more than was expected.

GOULD AND CURRY.—The winze near the north line from the 1,500 is rapidly sinking toward the 1,700-ft. level.

DAYTON.—The water in the bottom of the shaft is decreasing. The southwest drift, second level, running toward the Koesuth mine, has been cleaned out. The old Felix winze, 200 ft. above, has been cleaned out to the depth of 112 ft. The south ore stope on the second level has been connected with the first station level, producing a free circulation of air. All the ore-producing sections of the mine are looking fine, and the usual amount of ore is being extracted daily and sent to the Woodworth mill, Carson river.

PHIL. SHERIDAN.—At a depth of 140 ft. there has been encountered what is considered very favorable ground—a mixture of blue clay and quartz. Above their shaft the company have a long tunnel which penetrates the hill in a westerly direction. In this tunnel they encountered a very large body of quartz which assays at the rate of from $5 to $15 per ton. The prospects obtained in the tunnel were considered sufficiently encouraging to justify the sinking of a first-class shaft for the purpose of cutting the vein at a great depth.

CROWN POINT RAVINE.—The Crown Point Ravine Mining Co. have leased the Kentuck hoisting works, with the use of their shaft and a drift running west on the 450-ft. level, to be used in prospecting their vein, now opened to a considerable depth by means of a shaft. At the 200-ft. station in this shaft a drift has been run south in a continuous body of quartz for a distance of about 150 ft., and from this quartz assays ranging from a few dollars to $100 and over have been obtained.

IOWA.—Work has been resumed in this mine. The old tunnel has been cleaned out and putting shape. This tunnel was run many years ago and when work was stopped there were some very promising streaks of ore in its face.

CALEDONIA.—The main shaft is now down 42 ft. below the 1,000-ft. level. The rock at the bottom is harder than formerly. They are confident that they will be able to continue to progress at the rate of 20 ft. per week.

ANNES.—The indications met with on the first level continue of a most encouraging character. They are now engaged in drifting south on the course of the vein, the assays being from $12 to $15. The prospects are good for a fair development on this level.

YELLOW JACKET.—The main east drift on the 1,740-ft. level is being steadily advanced in ground of a favorable character.

SILVER HILL.—The several prospecting drifts on the third station level are encountering white quartz of a very fine appearance, in which bunches of very rich ore are occasionally met with.

WOODVILLE.—The ore bodies on the 200-ft. level are looking about as usual. The clean-up of the mill made last Wednesday yielded $2,000, showing that the ore produced paid about $40 per ton.

CROWN POINT.—The breasts throughout the ore-producing sections of the mine are looking and yielding well. The work of sinking the main incline below the $1,500-ft. level is being pushed ahead as rapidly as possible and good progress is being made. The main south drift on the 1,500-ft. level is going ahead as usual.

ROCK ISLAND.—Some water has made its appearance in the face of the main drift during the past two days.

UNION CONSOLIDATED.—The cross drift east from the main drift north on the 1,300-ft. level is in a very favorable formation.

LEO.—The ore in the several stopes and cross cuts is increasing in quantity and improving in quality.

SAVAGE.—Promising indications are being met with in the prospecting drifts on the 2,000-ft. level, and the sinking of the winze on the same level is progressing favorably.

LADY WASHINGTON.—The new hoisting machinery has been started up and found to work well and smoothly. Work was resumed yesterday at the 250-ft level.

OVERMAN.—The north drift on the 1,200-ft. level is still being pushed ahead in a mixture of quartz and porphyry, with occasional streaks of ore.

BUCKEYE.—The ore-producing sections are looking and yielding about as usual. The Hope mill, at Silver City, is kept in constant operation on ore from this mine.

SUNRISE.—Have increased the force of men in the mine. Have now nearly 300 tons of ore on the dump, and will shortly commence crushing.

OPHIR.—The present yield is about 60 tons per day. The Empire State mill is steadily running on ore from the mine with a considerable reserve of ore on hand. The rock worked during this month paid better than during any former month. Heretofore the yield of the mine has been taken from the winzes and raises between the 1,300 and 1,465-ft. levels, made for purposes of ventilation; now, however, they have commenced laying sill timbers on the 1,465-ft. level for the purpose of regularly mining ore, and the yield will be materially increased. The Nevada mill, on Six-mile cañon, has been secured and will soon be started up. This mill has a crushing capacity of 60 tons per day. The east cross-cut on the 1,465-ft. level is still being pushed steadily forward, and is promising well for the development of a large ore body east of anything ever heretofore found. The air compressor engine has been shipped from San Francisco.

BELCHER.—The completion of the new air shaft to the 950-ft. level has had the effect of reducing the temperature of the air on the 1,000, 1,100 and 1,200-ft. levels to such a degree that the miners now find it quite comfortable in all these sections of the mine—they are now able to work there with their shirts on. When the big shaft shall have been carried down to the bottom of the mine all the lower levels will doubtless be cooled off to such an extent that work can be carried on there as comfortably as is now being done on the upper levels. The ore-producing sections of the mine are all looking exceedingly well, and the daily yield is 500 tons.

KOSSUTH.—The main shaft is down 50 feet below the first station level. The sinking is good, there being no change either in the water or in the character of the rock encountered.

JUSTICE.—Is actively engaged in preparing for the erection of the new machinery, which is fast arriving. A fine pumping engine of 150-horse power arrived for the mine yesterday morning. The bed-plate of this engine weighs 22,500 pounds.

NORTH CARSON.—In the lower drift the workmen have encountered harder rock, and have consequently made less progress.

[Continued on Page 220.]

Manson's Atmospheric Power Hammer.

The machios which has made such a noiee and disturhanes, and collected such a crowd of peopls, night after night, in the northeast corner of he Mechanics' Psvilion, is Manson's Power Hammer. Ths esse with which this hammer is operated, ths perfect control which the operator hae over it, arresting at any point of its ascent or descent, ths wondsrful variations in the power of ths stroke, from ths enormous force given hy ths thres-foot sweep, to ths gentle tapping whioh would scsrcely crack a nut or hurt your finger — all these maks it a most intsresting machins, and thousands during the Fair hsvs eagerly watchsd its movsments. It is the invention of Mr. Wm. Manson, of Downieville. Patented Jnne 23d, 1874. It cousists of a working cylinder directly above the anvilblock, in which worke a piston and pistou-rod connected directly with the hammer. The working oylinder is of long stroke and small diameter, and is connected with the condensing cylindsr by open ports at each end. The condeniing oylinder is of large diameter and short stroke, and its piston is operated by a crank driven by a belt and pnlley. The air ie condensed alternately above and below the condensing pistou, operating upon the working piston in the same maunsr, above and below altsrnately. The length and force of the blow are regulated hy a stop-cock between the two cylindsre, and is operated by a haud lever, and can at pleasure strike any desired length of blow from one-eighth of an inch up to three feet. Thsy havs, aleo, in connection with the same condensing cylinder, small portabls hammers, connected with three-quarter rubber hoss of any required length, which can be carried abont in your hand, and applisd to rivsting, shipping and caulking, stons cutting, etc.

The principal advantsges over all other hammsrs are: sconomy of power, durability, cheapness of construction, and facility of application.

The same patent covsrs a rock drill, so light and compact that a man may carry it about in his hand and apply it in any dirsction. The drill is very effective; will penstrate hard granite at the rate of one inch in two minutes, as demonstrated at ths Pavilion. The great advantsges claimed for this drill are facility of application, economy of power, cheapness of construction, and its durability. The inventor promises to accomplish ths same results attained hy auy other drill, and at one-half the expense. The power ie communicated through the three-quarter inch rubbsr hose before mentioned. The pateut also covere quartz-crushing stamps, driven by ths same power. Several of these stamps are now in constant use. Mr. Manson claims that a two-stamp mill of this kind will crush ae much ore as a tsn-stamp mill of the ordinary styls.

Oakland G. & S. M. Co.—T. G. Nsgns, of Unionville, arrived in town last Tuesday direct from San Francisco, whsre he has been for the last two months supsrintending the construction of the machinery for a 15-stamp mill for the Oakland G. & S. M. Co., owner of the Eagle mins, a few miles south of Unionville. The machinery of ths mill was made at the Pacific Iron Works, San Francisco, and is first-claes in svery particular. Ths mschinery is all at Oreana and ths lumber for the building is all on the grouud near ths mins. Mr. Negus informs us that he will employ all the force he can use to advantage in the building of the mill, and that he expects to havs it in running order in two months from date.—*Silver State.*

Struck It.—A company compossd of Smith, Mills, Foots and others, havs been running a tunnel for eome tims ont near Cement hill, for the pnrpose of tapping ths ancient channel which is known to run through that vicinity somswhere. Althongh rspeated efforts have besn made and a great deal of money expended, bnt little encouragement has been reosived until a day or two since the tuunel was driven into the chaunel, and we are informed the gravel prospects first rate. The ground near ths place struck wss at one tims very rich, and several hnndred thousand dollars were taken ont. It is a pretty safe gusss that the owners have got a homs stake at lsst.—*Nevada Transcript.*

Mines, says ths *Transcript*, are made by opening np undevelopsd leads and veins. Thers are many veins in this county that if developed wonld make paying mines. The conuty wants men that will work the undevsloped ledges. Every man who is willing to work should he encouraged to do so. Thsrs is ons drawhack to men's doing just what is needed. There is not a ledge or a sign of a ledge in the whole country but some one pretends to own it. It may lie there 40 years and it will not bs tonched hy ths owner. But let another party commencs work with a prospect of devsloping a mine, and the ownsrship will soon bs made clear. There is somethiug wrong about it.

Virtue Mine.—In this mins, in driviug forth farther than has bsen hsretofore gons, thsy have struck a large hody of very rich rock. The vein is about two fsst in thickness. Mr. Hyde, the snpsrintendent, will run thrse drifts of 200 fest each in this mine, the contracts for the rnnning of which were let yesterday. New pump machinery has bsen ordered from San Francieoo and is now on the road here. Everything is being pnt in the hest of working order in and about thia mine, and ths public may soon hear of large clean-ups, and often, at thie mill and mine.—*Bedrock Democrat (O.)*

The El Dorado Canon Coal Mines.—W. F. Stewsrt, ths well-known ecisntiet and late editor or of the Virginia *Chronicle*, day before yesterday visited ths El Dorado cañon coal measures, and published his viswe in rsgard thersto in ths *Chronicle* of last evsning. We quote ths concluding paragrsph of his srticle, in which he sums up ths convictions in regard to ths coal formation of ths region named: "At pressnt ths company ars rnnning a drift for the purpose of draining ths uppsr ledges, but in ths conrss of a fsw weske thsy will commsnce sxtracting coal for commercial pnrposs. In conclusion, ws havs only to ssy that ths discovery of so sxtsnsivs a body of good fnsl, so closs to Virginia City, is a godsend. It will not hs long hefore our wood supply will he sntirsly exhsnsted, and, in ench predicamsnt the vaet machinery in thie locality wonld coms to a dead-lock. It is thsrefore gratifying to bs able to state from personal observation that the El Dorado coal mine is cspable of supplying for all time to come all ths fuel which may he needed in Western Nevada."—*Virginia Enterprise.*

Determining the Alcohol in Wines.—If to s known volume of water larger and larger quantitiss of alcohol are added, the deneity and the euperficial tension of ths mixtures obtsined are simnltaneonsly diminished, and consequently thsre is an increase in the numbs of drops which they form if allowed to flow slowly from a given aperturs. If this aperture has coustant dimensions, the numbsr of drops corresponding to each alcoholic mixture is constant also. Ths difference betwesn the numbers thus found is large enough to furnieh a hasis for a very sensitive alcoholio metrio method. The instrnment proposed is a pipette holding 0.3 cubic inch. It is filled with the alcoholic liquid under examination, and the number of drops eecaping is counted. From this nnmber the proportion of alcohol is calculatsd by the aid of tables which ths author hae drawn up. Slight traces of liquids more diffusible than alcohol, euch ss scetic ether, grsatly increase the nnmber of drops.—*Chemical News.*

The Carbon Light.—A uew and intensely white light has lately heen invented and sxhibitsd by Mr. William Day; of Ohio. A thin ribhon of carbon is suspended hstwsen two platinnm polss, and covered by a glohs containing dry carhonic acid gas. The ribhon receives an electric current from a battsry, and whils the atmosphere of the gas becomes brilliantly incandescsn, the carhon is not consumed, and the light is ssid to hs perfsctly constant. The method was invented by Profeesor Osborn, of Miami University, who at first thought it necesssry to use very thin strips of oarbon, but the light is now producsd with mnch larger ribbons and with little combuetion. The heat generated has nsver as yet broken the small glass globe containing the ribhon. This light heing ooustant, and not reqniring the combustion of oarhon, may prove much more ueeful to scientific lecturere than the ordinary electric or oxyhydrogen lights, b oth of which are troublesoms to hsndls.

Crystal Mining District.—A new mining district named Crystal has heen organizsd in the Fremont range, nortbeast from this town, by Ginacca, Gihtz & Co., proprietors of ths Hnmholdt reduction works. This company discovered a lode in the new district and named it "Louisa," which has been prospected hy a shaft to the depth of twsnty-five feet. At that depth the ore is three fest thick, and three car loads of it extracted in sinking hae heen taken to the mill for redncticn. Ten tons of thie ore has heen worked and it yielded $60 per ton in silvsr. The ore is decomposed, and contaiue a small percsntage of lead and antimony. Ginacca, who has had considerable expsrience in mining and knows whereof he speaks, thinks the Louisa ie a vsluable mine. The mountain in which it is situated is in plain view of town. —*Silver State.*

Mines in Saxony.—It appears that in 1871 there were in Saxony 569 minss, embracing 36,095 hectares, and in 1872 there were 630 minss and 39,000 hectares. Of the latter 312 were metallifsrons and soms other mines, 101 were collieries, and 217 were lignite mines. The minss appear to bs wsll officered, for it seems that in the metallifsrous mines there was an officsr for each seventeen men employed, whilst, taking mines of all classes, there are twsnty-two workmen for each officer, and the 1,234 officers have likewise to attend to 742 women. The nnmber of accidents, howevsr, appears to he comparatively small.

Slag.—In Belgium, ths glaes-makers ntilize slag as an ingredisnt nsed in ths prodnction of glass, and in ths same country it is turned to profitahle acconnt by the process of granulation. According to Professor T. Egleston, of the Colnmhia Collegs School of Mines, ths most valuable uss to which elag has yet been applied is the manufacturs of csment. Mr. Egleston aeserts that he has has eesn cement equal to any of the hest Portland cemsnt, made at a vsry small cost, and that from any slag, no matter how ths composition varies.

The piece of quartz found in the Burden claim, which creatsd a furors the other day, ranging in statement all the way from $20 to $500, when poundsd up turned out lsee than $40. So says the Tuolumne *Independent*. We have heard of a great many other pieces of quartz which turned ont in the same way. Estimatss of value of rock before crushing are seldom of much account, ae people are liable to exaggerate in matters of thie kind.

Aerial Navigation.—De Fonveille thinke it highly probable that the gss of a free balloon diffsrs in temperature from the external air hy 10° C., at least twice daily. This ruptnre of thermal equilibrinm mnst limit its courss to a vsry small number of days; independently of other disturbing canses, it would render a psssage across the Atlantic impossibls. Nor csn ths disturbanoe bs obviated by closing the orifice of ths balloon with a hsrmetic valvs. A small balloon of transparent csoutchouc sxplodss loudly when msrsly pisrced with a pin; this is dus to the snrprising rapidity with which the membrans is rent, although the prsssurs of the hydrogsn does not grsatly sxced that which would obtain within a largs fres balloon, whsrs it might hs sought to neutralizs ths effects of the eolar dilatation. Nor would ths grsatér resistancs of envelop obvists the disastsr. M. De Fonveille also remarks on the deepatching of pigeons from balloous at regular intervals, on the diesstrous voyags of Mountain and Bailey, and other topics.—*Academy of Sciences.*

Silvering and Gilding Iron.—S. L. Delatot, of Paris, has taken a patsnt for platiug iron with silver and gold without previously copper plating. Ths iron ie fnsed with 1.2 per cent. nickel and 1.20 per cent. manganeee. Such iron is immersed in water containing 1 per cent. slaked lims, and is immediately, without drying, put into the silver or gold solution. The former is prepared hy dissolving ½ part of nitrate or chlorids of silver, 2 parts bicsrhonats of soda, and ¾ part cyanide of potassium o eed um, in 100 parte of water, and adding ar few drops of prussic acid solution. The gold solution is made up of 100 parts of water, 1-64 part chloride of gold, 4½ parts bicarbonate of soda, 1½ parts pyrophosphats of soda, 1-16 part cyanide of soda, and a very little prussic acid. The ordinary electro-galvanic process is employed.

An extraordinary account hae appeared in a French agricnltural jonrnsl, to the effect that straw forms admirable lightning conductors. It had bssn observed that straw had the property of discharging Leyden jars without spark or explosion, and some one in the neighborhood of Tarbes had the idea of constrncting straw lightning conductors, which were formsd by fastening a wisp or rope of straw to a deal stick by means of brass wire, and capping the conductor with a copper point. It is asssrted that the sxperiment has been tried on a largs scale arouud Tsrbss, 18 oommnnes having besn provided with such etraw conductors, only ons being erscted for every 60 arpents, or 750 acres, and that the whole neighborhood has thus heen prsserved from the effects, not only of lightning, bnt of hail also.

Honey Mine.—The other day, as Mr. William McVay wse hlasting in the cliffs of mountains east of Grayson, in ssarch of qnicksilver, he was astonished at a swarm of honey hees leaving the crevice. Another blaet of powdsr and the cause wae revealed. Instsad of quicksilver hs has fonnd a mine of pnre honey of the most delicious flavor. Over 400 pounds were taken from the cave, or excavation, in good merchantable condition. It is presumed that the hses have heen at work in their rock-hound hive for some years, and would have, undoubtsdly, remained had not our enterprising prospector disturhsd them. We understand that work will now he pnshed ahead on that claim, as the finding of such a largs quantity of the sweets of life at the very outset is considsred a good omen.—*Stanislaus News.*

The Providence Mine.—We understand that the Providence mine is looking well, and that a full force of men are at work. The ledge continuee its usnal sizs and ths rock pays wsll. The snlphnret works enable the owners to obtsin all the gold in the rock without hauling a mile or two as they formerly wsre obliged to do. The work goes on quietly but thoroughly, and devslopmsnts are heing made that ehow ths mine one of great valne. The persietency of the owners in continning to expend their money under the adverse circumstancee which attended their working for the first two years after their pnrchass, is deserving of a rich reward, and they have the most flattering prospects of recsiving it.—*Nevada Transcript.*

The *Enterprise* of Ssptemhsr 25th, says: The scarcity of water in the Carson river has caused the ehutting down of eo mnch machinery in the mills that the hullion yield for the present month can not be otherwise than light. How the Belcher and Crown Point will manage to pay their nsual dividsnds remaina to he seen, as nsarly all the mills of these companies are on the rivsr. The Con. Virginia will in no way hs affected, as all of their mills are driven by steam; thsy will, therefore, produce the usual amount of bullion.

New Hoisting Works.—We noticed in passing the Murchie mines the other day, that there has heen a nsw building erected at the lower edge, the mschinery used heretofore heing moved into it, and rook is heing raised. Both mines are said to he improving steadily. New hoisting works will also soon he erectsd on ths North Star lode. The owners are all miners, and can make a mine pay if anyone can. —*Transcript.*

Clothes Cleaning. — Rnhbing champagne stains, grease epots, etc., first with ammonia and afterwards with benzine, will remove them.

Varnish Manufacture.

To the lsft and near the entrance of the Mechanice' Institute Pavilion may be seen the sxhibit of the Pioneer Varnieh Works, Hueter Bros. & Co. There sre ninetesn vsrieties of prepared varniehes arrayed in a most sttractive manner, in as many long, flat bottlee, made in New York expressly for this pnrpoee; also about twenty samples of gums from which ths varnishes ars manufactured. All thsss are arrangsd ou a handeome carved show-frame, mads in imitstion of show-framse used at the Vieuna Exposition; also an elegant show-frame containing ons hundred sampls of fine hrnehss and psncils; they also show a largs varisty of artists' materials and sealing wax of all tints. the sticke varying in size from that of a lsad pencil to a foot in length by one inch square. As the manufacture of varnish is not a common industry, the procese and msnner of obtaining the material may he considered of interest:

The subetancee from which varnish is mads are gum copal, prepared linseed oil and spirite of turpentine or benzine. Of copal there ars many different kinds, varyiug in price from 10 cents to $1 per pound. It ie a product of the copal tree (*rhus copallina*), which growe in Africa, Anstralia and the East Indies. The gums are named from the places whers they are found, Manilla, Kanri, Mogador, Sierra Leons, Bsoguela, Zanzibar, etc. The last named ie considered the hest in quality, and is chiefly ussd in the manufactnre of coach and carriage varnishee. All these gums are found emhedded in the earth from one to ten feet helow the surface, having oozed out of the treee psrhaps hundreds of yesrs ago, judging from their hardnese. It is no nncommon occurrence to find insects perfectly preservsd in eome pieces of copal, showing that the gum mnst have once heen a very thin liquid.

To proceed with the msnufscture. These gums, after bsing csrefnlly selected and cleansd, are fussd in copper and enameled iron kettles, made expressly for this purpose. This process requires grsat caution, practice, and a large amount of experience, as eaoh kind of copal musths differently treatsd (an experienced hand commande very high wages, and in the Eastern Statee is very frequently partner or sharsholdsr in the bueiness.) The linssed oil ussd in the mannfacture mnst be strictly pnre and aged, and after being prspared with driers, ie storsd away to clarify—each kind of varnish requiree a differently prepared oil. The gnm copal whsn fnsed is ready to receive the drying oil, but only combinee with the latter when it is heated to a certain degrse. After cooling spirite turpsntine or benzine is added and the varnish is then stored away in tanks, which should be surrounded by a warm, even temperature, in order to make the clarifying process a thorough one.

For several yeare ths varnish trsde hae suffered grsatly, for the reason that some unscrupulous Eastern manufacturèrehave drugged the market with varnishes largely sdultsrated with rosin. Thie product, worth from one to thrse cents per pound, will necessarily make a pale varnish, hut one of no durahility whatever. It remsins "tacky" for a long time and losss its glose in a fsw weeks. The price at which these varnishes are sold is proof conclusive that they are not made of copal. Every consumer and dealer can find the lowest price of copal, oil and tnrpsntine qnoted in our commercial papers, and must draw the conclnsion therefrom that a purs article cannot possihly be sold or manufactured at snch figures.

The proprietors of the San Francisco Pioneer Varnish Works have made it a po'nt to manufactnre none but perfectly pure and reliahle varnishes, and the numerous testimonials from leading dealere and consumers go to show that the goods they tnru ont have given nniversal satiefaction. At their new factory, built aftsr the latest improved Enropean plan, they ars able to produce from 300 to 400 gallons per day, and the dirsct importstion of the matsrial used enables them to compete with any of ths leading Eastern firms, not alons in the price, but also in the quality of their mannfactures. The firm are also agents for Harland & Sous' English coach varnishes and are dealers in fine brnshss and artists' materials. Sixteen yesrs ago, 1857, this firm, then styled Marx & Hueter, received the first diploma for varnishes mauufactured here.

Disintegration of Tin.—A manufacturing honse in Rotterdam despatched for Moscow last winter a certain qnantity of tin, in the ordinary form of hlocke. The metal, convsyed by railway in very cold weather, reachsd its destination in the form of a powder of largs orystallins grains. It had a gray color, quite differsnt from that gsnerally preeentsd by tin. Chsmical analysis showed that the metal was almost quite pnre, containing at the most 0.3 per cent. of foreign snbstances (lead and iron).

Sulphuron.—C. Roberts recommends to saturate snblimated snlphur partly with snlphnroue acid, and to use this product, whioh hs calls sulphuron, instsad of the fine pulverized snlphnr, for the destrnction of vegetable and animal paraeites living upon plants like, vinss, roes bushee, etc.

Auburn Mill.—This mill is now running on ore from all quarters of ths globs, one might almost say, and not stretch the truth. Latsly some very fine looking rock hae heen rsceived from Cornucopia. The Anburn Mill company ie making a good record for itself.

Useful Information.

Treatment of Furs.

Mr. Jos. Tussaud communicates to the New York *Tribune* an originel and effective plan devised by him for the preservation of furs. The attention of Mr. Tussaud was first called to the subject by his desire to transfer the hairs of fur-bearing or other animels to wax-figures without including the skin in which they grew. After numerous experiments he succeeded in accomplishing this and developing a new industry. The great object which he aimed to secure was the removal of the hair or fur from the natural to an artificial skin, obtaining thus a more perfect degree of preservation for any purpose whatever, while retaining the hairs in their original and natural relationship. For this purpose the piece of fur to be treated may be soaked in lime water or other suitable liquid, as practiced by tanners, for the purpose of loosening the adhesion of the hair. It is then to be washed in water, and hung up for a time to dry off the excess of moisture. It is then laid on a board, with the hair side up, and a solution of glue applied by means of a brush, taking care not to disturb the natural position and relation of the hairs. The size or glue is then allowed to harden, when it will hold the fibers very firmly. The natural skin may then be pulled entirely off from the hairs, leaving their ends exposed, which may then be washed by some substance to free them entirely from adherent fat, bulbs, etc., and properly poisoned. An artificiel skin is next to be affixed, by applying India rubber, gutta percha, boiled drying oils, or other water-proof substances, over the roots of the hairs, and allowed to dry, so as to form a continuous membrane; after which, all that is necessary is to again soak the skins in warm water for a time, to dissolve out all the glue, and the new fabric is produced in its completed condition. To render the rubber or gutta percha more lasting, it may be combined with sulphur, so as to vulcanize it, for which purpose a solution of chloride or hypochloride of sulphur in bisulphuret of carbon may be employed. In using bisulphuret of carbon, 40 parts of the same are to be added to one part of chloride or hypochloride of sulphur, prepared as neutral as possible, and the solution is then allowed to remain in contact with the artificial skin of rubber or gutta percha for a longer or shorter time, a minute being sufficient for a thin sheet. This operation must be completed, of course, before immersing in warm water to remove the glue which produces the adhesion of the hairs. One great advantage of this process consists in the fact that fabrics thus prepared are moth-proof, and it is suggested that for many purposes, such as the construction of rugs, mats, etc., they must be superior to the natural skin. In the case of heavy skins, the artificial preparation is much lighter, more pliable, and better in every respect. Several of these artificial skins may be combined so as to form one, or they may be modified in any manner desirable. When properly made, the preparation is entirely free from any smell, and especially the animal odor, which is so offensive in many furs.

Back Yards.

The *Rural New Yorker* has a very sensible article on the general untidiness of the rear of the average American houses: Take the prettiest and best kept village of New England, and we doubt if a tenth part of even the most pretentious mansions and the most ornate cotteges will bear examination in the rear. Instead of being nicely finished in all their petty domestic details and conveniences, and kept snug and trig, with trim grass-plots, with all the subordinate avenues and garden approaches well-graveled, clean-swept and free of refuse, and everything wholesome and orderly, there is apt to be a look of general untidiness, as if all the residual rubbish of years had been dumped therein. Not unfrequently a railroad runs its track in such a manner as to expose the rear of plenty of houses to the eye of the traveler over it—whose sense of neatness is offended by square rods of back-yard lumbered up with every conceivable variety of second-hand, damaged and invalid articles known to domestic use, from a horse-cart disabled by broken thills and wrecked wheels, to the ghost of the baby-carriage which survives two generations of children; interspersed with smashed crockery, rusty and condemned tinware, old boots, sardine boxes, disabled junk bottles, hoop skirts which would have outlived all usefulness if they had ever had any, chips, burdock, mullein, ashes, half-burned lumps of wasted coal, and all imaginable litter, trash, debris and dirt. On the other hand, nothing is prettier than a cottage which is thoroughly well-kept in the rear as well as its more public portion. It seems inevitably redolent of a purer, sweeter, happier domestic life than one with heaps of festering rubbish crowding hard upon it.

A company has been formed to work the sulphur deposits at White Island, a marine volcano 140 miles from Auckland, a description of which, communicated by M. Morhange, appeared in the Press some time since. It is estimated that 100,000 tons of sulphur in an almost pure state are lying on the island ready for shipment. The *Journal of the Society of Arts* says that chemical works are likely to be established soon, and the island leased.

Warmth of Clothing.

Dr. Von Pettenkofer, in a careful study of the subject of the warmth of clothing, recently published, has pointed out that the permeability of stuffs to air is a condition of their warmth. Of equal surfaces of the following materials, he found that they were permeated by the following relative quantities of air, the most porous, flannel, such as is used ordinarily for clothing, being taken at 100:—Flannel, 100; linen, of medium fineness, 58; silk, 40; buckskin, 58; tanned leather, 1; chamois leather, 51. Hence, if the warmth of cloth depend upon the degree in which it keeps out the air from our bodies, then glove kid must be 100 times warmer than flannel, which every one knows is not the fact. The whole question, then, is resolved into that of ventilation. If several layers of the same material be placed together, and the air be allowed to permeate through them, the ventilation through the second layer is not much less than through the first, since the meshes of the two form a system of continuous tubes of uniform diameter, and the rapidity of the movement of the air through these is effected merely by the resulting friction. Through our clothing, then, there passes a stream of air, the amount of which, as in ventilation, depends upon the size of the meshes, upon the difference of temperature beween the external and internal atmosphere, and upon the velocity of the surrounding air. Our clothing, then, is required, not to prevent the admission of the air, but to regulate the same so that our nervous system shall be sensible of no movement in the air. Further, our clothes, at the same time, regulate the temperature of the contained air, as it passes through them, so that the temperature of the air between the clothing and the surface of our body averages 84 deg. to 86 deg. Fah. The hygroscopic property of different materials used for clothing essentially modifies their functions. This property varies with the different materials; wool, for instance, takes up more water than linen, while the latter takes up and gives off its watery contents more rapidly than the former. The more the air is displaced by water from the clothes, the less will be their power of retaining the heat; in other words, they conduct the heat more readily, and hence we are quickly chilled by wet garments.

Useful Rules.—The following simple rules should be at hand with every millman, and in fact every one who has charge of machinery of any kind: To find the circumference of a circle or of a pulley—Multiply the diameter by 3.1416; or as 7 is to 22, so is the diameter to the circumference. To compute the diameter of a circle or of a pulley—Divide the circumference by 3.1416; or multiply the circumference by .3183; or as 22 is to 7 so is the circumference to the diameter. To compute the area of a circle—Multiply the circumference by one-quarter of the diameter; or multiply the square of the diameter by .7854; or multiply the square of the circumference by .07958; or multiply half the circumference by half the diameter; or multiply the square of half the diameter by 3.1416. To compute the diameter of a toothed wheel—Multiply the number of the teeth by the true pitch and the product by .2184. These results give only the diameter between the pitch line on one side and the same line on the other side, and not the entire diameter from point to point of teeth on opposite sides.

The curators of the Anatomical Museum of the *Jardin des Plantes*, in Paris, have found that spirits of turpentine is very efficacious in removing the disagreeable odour and fatty emanations of bones or ivory, while it leaves them beautifully bleached. The articles should be exposed in the fluid for three or four days in the sun, or a little longer, if in the shade. They should rest upon strips of zinc, so as to be a fraction of an inch above the bottom of the glass vessel employed. The turpentine acts as an oxidizing agent, and the product of the combination is an acid liquor which sinks to the bottom, and strongly attacks the bones, if they be allowed to touch it. The action of the turpentine is not confined to bones and ivory, but extends to wood of various varieties, especially beech, maple, elm and cork.

Spontaneous Combustion of Wool.—The Press recently contained an item clipped from an English exchange, which might be likely to mislead readers if left uncorrected. We are now informed by Mr. J. R. Woods that the ship "Red Jacket," of the Liverpool and Melbourne line, was set on fire from this cause, and that the "King of Italy," formerly the "Angusta Wattenbach," while on the voyage from Australia to England, was entirely destroyed by spontaneous combustion of wool on board. Our correspondent adds that other cases could be cited.

Testing Dampness.—The editor of the *Scientific American*, in answer to a correspondent, says: The easiest way to test for moisture in a cellar will be to provide yourself with a thermometer, a glass tumbler filled with water, and a piece of ice; then notice how low the thermometer, when placed in the tumbler, has to sink before any moisture begins to show itself on the outside of the vessel of cold water. The lower the temperature to which the thermometer has to sink before moisture is precipitated, the less there is of it in the moisture of the cellar.

Good Health.

The Increased Use of the Members.

We doubt if the human body has ever in any instance attained the acme of its possible development; and by this we mean that while certain sets of muscles or organs have, in individual cases, become subjected to the will so as to perform feats impossible save through education, we do not believe that the being ever lived who could control every member so as to cause it to operate to the extent of its capabilities. Whether in future ages such a condition will mark a higher stage in the development of the race; whether, as the human mind expands, or as the saying is, the "world grows wiser," it is reserved for physical culture to keep pace with such mental growth, is a subject for speculation, which, in view of the doctrines of evolution and the constant approach of organic species toward more perfect individualism, is by no means devoid of present interest.

We have discussed at some length the question of the use of the left hand, and we have pointed out that, by a mistaken notion, children are taught to discard the use of the member, and hence to lose half the powers which nature intended they should have when she formed the body as it is. We have also suggested that, so far from restraining the infant from using its left hand, its tendency to employ both members indiscriminately should be encouraged. Now, we propose to advance a step further, and to ask why should not a child be taught to utilize both hands at once, and at different occupations. The idea may seem somewhat chimerical at first, but it is not without the bounds of possibility. The reader has doubtless seen jugglers who, in performing their dextrous feats, become so expert that, without any apparent difficulty, they can keep half a dozen knives or balls constantly in the air or on each hand. The falling and rising of these objects are not uniform, and hence to all intents the performer accomplishes a totally different result with each member. In similar manner great pianists—Rubenstein is a very striking example in point—use either hand upon the keys with equal dexterity and both together in playing music of tremendous difficulty, which requires a power of perception and a control of the muscles of each individual finger which is simply wonderful. Again, an organist, in performing upon a grand instrument, has several things to think of at once; both hands on the keyboard, both feet on the pedals, with stops on either side, couplers and the separate devices for the *crescendo* and other accidental effects are to be looked after. Here are four members of the body acting different parts at the same time.

We could multiply instances of this kind with little trouble, all going to show that even when advanced in life it is possible to educate a certain set or even sets of muscles to perform hitherto unnatural work. Cases there are where men, on being disabled in the arms, have had recourse to their toes, and used those members for writing and even handling tools. We have visited the studio of quite a celebrated French artist whose exquisite paintings were entirely produced with brushes handled in the above manner. But while an individual member or even the body may be educated to perform feats apperently impossible, it requires a higher order of training to compel the members to perform different operations at once—a training, we think, only to be fully imparted in beginning at the earliest years, but still fully possible. With our dual brains the right lobe is now the most developed, and with it the dexter side of the body. Let means be taken to develop the left side equally, and the body is symmetrical in its powers. Each side, governed by both brains, will be capable of work for which now, when controlled by, say, three-quarters of the brain power, it is inadequate.

We need not point out the advantages to a person who can thus use both hands in connection with the brain. We have known an artist who could draw two different pictures at once; and a very eminent professor of natural history, while watching a specimen through a microscope, sketches with one hand while writing with the other. Now, if a person advanced in life can become so educated, how much easier it would be to impress the same on the plastic mind of a child! Once taught, the person could write upon two different subjects at once, could make two copies at the same time, could write up two sets of books, could make stenographic notes and write them out in long hand simultaneously, and perform in brief a variety of operations productive of lucrative results. Moreover, he could do each understandingly, and not semi-automatically with one hand. Nine-tenths of ordinary pianists who have to "learn a piece" play the treble with their brains and the bass with their muscles. The left hand learns certain fixed skips and jumps by practice, and performs them automatically at certain times, while the right hand carries the expression as well as the air of the composition, and is much more directly under the control of the performer.—*Sci. Am.*

Writers' Cramp.—This disease is more common than one would suppose. Dr. Poore mentions ten cases as having occurred in his own practice within a year, and he gives specimens of the handwriting in various stages of the disease.

Natural History.

The Laughing Plant.

The London *Garden* copies, from Palgrave's work on Central and Eastern Arabia, an account of a plant whose seeds produce effects similar to those of laughing gas. It is a native of Arabia. A dwarf variety of it is found at Kaseem, and another variety at Oman, which attains to a hight of from three to four feet, with woody stems, wide-spreading branches, and bright green foliage. Its flowers are produced in clusters, and are of a bright yellow color. The seed pods are soft and woolly in texture, and contain two or three black seeds, of the size and shape of a French bean. Their flavor is a little like that of opium, and their taste is sweet; the odor from them produces a sickening sensation and is slightly offensive. These seeds contain the essential property of this extraordinary plant, and, when pulverized and taken in small doses, operate upon a person in a most peculiar manner. He begins to laugh loudly, boisterously; then he sings, dances, and cuts all manner of fantastic capers. Such extravagence of gesture and manner was never produced by any other kind of dosing. The effect continues about an hour, and the patient is unconsciously comical. When the excitement ceases, the exhausted exhibitor falls into a deep sleep, which continues for an hour or more; and when he awakens, he is utterly unconscious that any such demonstrations have been enacted by him. We usually say that there is nothing new under the sun; but this peculiar plant, recently discovered, as it exercises the most extraordinary influence over the human brain, demands from men of science a careful investigation.

Learned Birds.

The Baltimore *American* gives the following account of a troupe of trained Java sparrows and paroquets now exhibiting in the streets of that city: "When a suitable place is found, a circular table is opened, and the birds turned loose upon it. They manifest no fear at the crowd, and do not offer to escape. The performence consists of ringing bells, trundling small wheel barrows, sleek wire walking, firing off pistols, dancing, swinging each other in small swings, an excellent imitation of a trapeze performance, and a number of other equally interesting tricks. The most wonderful part of the performance, however, is done by a paroquet. The bird walks to the center of the table, and, after bowing to the crowd, seats himself on a chair near a bell. To the clapper of the bell there is attached a small cord, and any one in the crowd is allowed to ask the bird to strike any number of times upon the bell. If asked to strike 10 times, he leaves the chair, seizes the bell-rope and pulls it 10 times, after which he bows and returns to his seat. This was repeated a great many times, and, with one exception, the bird made no mistake. The bird will strike 27 times, but after that he refuses; and his owner states that he has worked nearly a year to get this bird to strike up to thirty, but it appears that his memory gives out at that point, and it is unable to count further."

Marine Animals in Fresh Water.—Prof. Ramsey, in *Popular Science Monthly*, states some facts which certainly have a most important bearing upon the attempts of our fish culturists to habituate shad, salmon and other anadromous fish in salt water, and ought to encourage them to hope for complete success. He says: At the present day, animals commonly supposed to be essentially marine, are found inhabiting fresh water. In the inland and fresh lakes of Newfoundland, seals which never visit the sea, are common and breed freely. The same is the case in Lake Baikal, 1,280 feet above the sea level, in Central Asia; and, though these facts bear but slightly on my present subject, seals being air-breathing mammalia, yet in the broad mouth of the Amazon, far above the tidal influx of the sea water, marine mollusca and other kinds of life are found, and in some of the lakes of Sweden there are marine crustacea.

Mushroom Power.—A correspondent of the *Gardeners' Chronicle*, of London, gives an interesting account of the force exerted by the mycelium of the mushroom in making its way through apparently impenetrable materials. He says: "I observed a few days ago in our mushroom-house, with considerable interest, and I may say, with surprise, the penetrating power of mushroom spawn. One side of the bed is of brick, 4½ inches thick, firmly set in hard lime, so close in the texture that it is impossible to introduce the point of a nail without considerable force. Nevertheless, the mycelium found admission, and produced mushrooms of a considerable size on the outer side. The wall in several places contains porous bricks, and there, too, the mycelium found its way right through."

Rabies in Ants.—Corrosive sublimate, it is said, has the most remarkable effect upon ants. The powder, strewed in dry weather across their path, seems to drive every ant which touches it crazy. The insect runs wildly about and fiercely attacks its fellows. The newsoon travels to the rest, and the fighting members of the community make their appearance with a determined air, as if the obstacle would be speedily overcome by their efforts.—*Naturalist in Nicaragua.*

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Air Compressors; Patronize Home Manufacture, 209. Hand-Boring Rock Auger; Information Wanted for the Mining Commissioner's Report; Oyster Culture, 216. United Workingmen's Exhibit of Furniture; Crow Blackbirds; Coal in California, 217. Patents and Inventions, 220.

ILLUSTRATIONS.—Fauntleroy's Improved Air Compressor, 209. Crow Blackbird, 217.

SCIENTIFIC PROGRESS.—Effect of Carbon on Iron; Temperature of the Earth; Action of Water upon Lead Pipes; Galvanic Electricity without Chemical Action; Heat of the Sun, 211.

MECHANICAL PROGRESS.—Railway Inventions; Two Centuries Hence; French Saw-Making; An Ingenious Invention; Railways in America; First Locomotive in America; Beam End Protector, 211.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 212.

MINING SUMMARY from various counties in California, Nevada, Arizona, Montana, Colorado and Utah, 212-213-220.

USEFUL INFORMATION.—Treatment of Furs; Back Yards; Silvering and Gilding Iron; Heat of the Sun; Spontaneous Combustion of Wool; Testing Dampness, 215.

GOOD HEALTH.—The Increased Use of the Members; Writers' Cramp, 215.

NATURAL HISTORY.—The Laughing Plant; Learned Birds; Marine Animals in Fresh Water; Musbroom Power; Rabies in Ants, 215.

MISCELLANEOUS.—The State University; American Metals; Bread Made with Sea Water; Water Troubles on Carson River; Julia Mine; The Fastest Time Ever Made on the Hudson River Railroad; A Rich Cinnabar District; Sonoma as a Mining County; Washington & Creole, 210. Manson's Atmospheric Power Hammer; Oakland G. & S. M. Co.; Struck It; Virtue Mine; The El Dorado Canon Coal Mines; Determining the Alcohol in Wines; The Carbon Light; Crystal Mining District; Mines in Saxony; Slag; Aerial Navigation; Silvering and Gilding Iron; Honey Mine; The Providence Mine; New Hoisting Works; Varnish Manufacture; Disintegration of Tin; Sulphuron; Auburn Mill, 214. Cinnabar, Lake and Calistoga Districts; Mining and Lumber Interests in Nevada County; Conduction of Heat; Bull Run Mines; Nickel and Cobalt; The Oakland Mine; Fair Returns; Paradise Mining District; Mendocino Cure for Snake Bite; Omega Mining and Water Company; Express Ranch Mines; Benicia Tanneries; Miner's Candlesticks, 218.

THE Owyhee Water and Gravel Mining company, Mountain Island district, State of Nevada, 80 miles north of Etko. The mines are 40 miles distant from any road except such as has been made hy the company. This claim covers 160 acres hy original purchase, and also by subsequent purchase 300 acres more. They also claim the waters of three creeks; the south fork of the Bruno creek, Bruno creek and Penrod creek. The company have already expended $10,000 in prospecting; they are now building a ditch five and a quarter miles long, three feet at bottom, four feet at top, and high enough to carry 1,000 inches of water. One inch of water will give 75,000 gallons in 12 hours. This ditch is so far advanced that they expect to finish it by the 15th of October. They employ 14 white men and 60 Chinese. Work was commenced in November, 1873. On a very small piece of ground, in the month of June, in 15 days' run, with 80 inches of water, they took out $1,560 in bullion. The dust is very fine, and assays $19.60 to the ounce. The water was too low to continue working the claim to advantage, which led to the construction of the ditch, above referred to. They expect to have a run this fall, and calculate to realize from $15,000 to $20,000. The officers of the company are J. W. Pence, (banker, Mineapolis, Indiana,) President; R. Lande, Secretary; M. A. Baldwin, Superintendent; J. W. Pense, O. H. Le Grange, H. H. Pierson, B. Lande and M. A. Baldwin, Directors.

WONDERLY'S CAR COUPLING.—Mr. A. Wonderly, of Palisade, Nevada, the inventor of Wouderly's patent car coupling, has his invention in practical operation on the Eureka and Palisade Narrow Gauge Railroad, where any one who wishes can see how the coupling works. The owners of the patent are Messrs. Wonderly, Griffin & Co. The patent for this invention was obtained through the agency connected with this office, and we are glad to know that their invention gives satisfaction after being practically tested. The owners of the patent are well known as gentlemen of enterprise and business capacity and they will no doubt introduce their car coupling on other railroads.

IN Rush Valley district, Utah, they are opening up some excellent prospects.

A Hand Rock-Boring Auger.

Mr. A. J. Doolittle, of Liberty Hill, Nevada county, has shown us a peculiar hand drill or auger for rock boring, which works on the principle of the ratchet drill. This drill was invented by R. A. Thomas, of Damascus, Placer county, Cal., now of Ohio, and has been in use by the Mountain Gate Tunnel Company for some four years, during which time they have run about a mile of tunnel through slate bed-rock, and have raised therefrom five shafts averaging one hundred feet in perpendicular hight. The company certifies that this drill saves them about one-half the expense of blasting attending the use of the ordinary hand drill. It is also used by the Van Emons Bros. in the Big Gun claim, at Michigan Bluffs, and by several other companies in the same neighborhood who also certify to its superior merits. It has also been used in cutting the Doolittle & Raymond ditch from Liberty Hill to Bear river, a distance of nine miles, which has been run chiefly in slate and hornblende bed-rock. By boring long horizontal holes on the bottom of the ditch grade, beneath the vertical slate, a strong, rock-walled ditch is formed by the natural action of the explosives almost as cheaply as a flume, thereby demonstrating the increased value of such enterprises when affected by the aid of these machines.

For driving bed-rock tunnels, raising shafts, carrying out grades by bed-rock cuts, railroad and turnpike grading, quarrying, coal mining, quicksilver and quartz mining, and general adaptation for work in limited space, it is believed to be superior in point of cheapness, simplicity of construction and lightness to other hand drilling machines in use.

One of these machines for a sluice-grade tunnel eight feet square weighs about 200 pounds, is all iron and steel, and can be set up by the aid of extension screws and put to work by an experienced operator in ten minutes, and can be thrown down ready for a blast in two minutes; it is easily operated by one man or more, according to the feed screw in which the auger is set; it is guaranteed to be thoroughly reliable in the hands of working men when the bits are kept in order.

Mr. Doolittle has the right for the construction and use of these machines for the Pacific coast. Since it has been in his hands he has made several improvements which have greatly added to its value, and nearly doubling its cutting capacity, for which he has applied for letters patent through the MINING AND SCIENTIFIC PRESS Patent Agency.

Two of these rock-boring machines have been recently set to work on the tunnels now being driven through the "Mussel Rocks" on the beach four miles south of the Ocean House and seven miles from the Cliff House near this city, where it is said they are doing "first-rate" in the hands of inexperienced men. These tunnels are ten feet square, and may be seen by a very pleasant drive on the sea beach at low tide. It can bore holes very rapidly from two to three inches in diameter and six feet deep, and at any desired angle, through ordinary slate, serpentine, sandstone, limestone, etc. It bores dry and clears itself to quite a depth, and we are assured that these augers carry their edges much longer than drills made from the same quality of steel where operated in the usual way by blows received from a hammer or other similar power; probably because of the absence of the severe concussion on the high grades of steel now used for drills.

Mr. D. is prepared to furnish his improved machines from the Ætna Iron Works, of San Francisco, where he may be addressed, or Dutch Flat P. O., Cal.

WAGES IN SAN FRANCISCO.—The work on the New Palace Hotel in this city now gives employment, directly and indirectly, to over 1,200 men, and at the most liberal ratee of wages paid on the coast. The pay-roll for last week required the sum of $17,503,55, distributed as follows: Masons, $6,769.25; carpenters, $4,590.40; hodmen, $3,350.65; laborers, $2,793.25. The scale of wages paid is, for masons, $5 per day; carpenters, $4; hodmen, $3; laborers, under which head is included engineers, etc., $2 to $4. The foremen and sub-foremen are paid from $4 to $8 a day. The office of the book-keepers and cashier is located on the opposite side of New Montgomery street, at the corner of Jessie, and allowing half a minute to each man, eight hours are required in paying off the weekly wages. One-half receive their pay on Mondays and the remainder on Tuesdays.

AT the Valley quicksilver mine, Napa county, the ore worked, without assorting, yields about one-half of one per cent, or 10 pounds of quicksilver per ton of ore. The capacity of the furnace is 24 tons per day, though they average about 20 tons, which at 10 pounds of quicksilver per ton, is 200 pounds per day, or 75 flasks per month. The superintendent gives the cost of reduction as follows: To mine and deliver the ore at furnace, $2 per ton; smelting and putting the quicksilver into flasks, $1.55; total expenses, $3.50. If these figures are correct, and there is no reason to doubt them, quicksilver mining, even with low grade ore, is more profitable than quartz mining generally.

A MR. GEIST has been buying old dumps in Little Cottonwood, and by sorting and screening has sacked and shipped hundreds of tons of ore that paid well for working. That would be a good business in many other camps.

Information Wanted for the Mining Commissioners' Report.

The U.S. Mining Commissioner of Mining Statistics, R. W. Raymond, being desirous of collecting for his annual report on mining statistics for 1874, trustworthy information concerning the mining intsrests of California, has issued a circular requesting information on subjects connected with the mining industry. He is unable to examine, either personally or by agents, all the districts of the State (the Congressional appropriation being inadequate) and takes the method referred to, to obtain the necessary information. The leading districts will probably be visited, but circulars will be sent to prominent mining men all over the State, and it is to be hoped that they will respond to the call.

The commissioner desires information on all important points and we quote from the circular as follows to show the class of information desired, so that miners may be prepared to answer the circular when sent to them.

1. A brief review of mining operations in your county or district for the current year, and notices of any important works either in progress or completed, (such as mills, mining ditches, tunnels, etc.,) and, where practicable, copies of the reports of civil and mining engineers on such projects.

2. QUARTZ MINING.—The names and brief notices of the producing quartz mines in your county or district, with information relative to the average yield, method and cost of treatment. (Blank Tables will be furnished on application.)

3. HYDRAULIC MINING.—The estimated area (in acres) and average depth of hydraulic ground now being worked, and the extent of such unworked deposits in your county or district, with an estimate of the yield of ground (per cubic yard), and a statement of the quantity and price of water (miners' inches) and the average length of the mining season. (This class of information cannot be conveniently compiled in tabular form.)

4. DRIFT DIGGINGS.—In this class of mining, the average yield per car load, (16 cubic feet) with the method and cost of treatment, and where practicable descriptions of works of this class, comprising length or depth of tunnel, incline or shaft, width of channel, thickness and character of pay strata, geological formation, etc.

5. TAILINGS.—Where operations are in progress for the removal of "tailings" (the accumulated debris of hydraulic washings), the method employed, the extent and estimated yield of such tailings (per cubic yard), and any other pertinent information respecting this class of mining.

6. The names and post office addresses of owners or Superintendents of producing mines in your vicinity—quartz or placer—and the addresses of owners of quartz mills in operation. All quartz mines which have raised 100 tons or more of milling rock during the year may be considered, for the purposes of this report, as producing mines.

Superintendents and secretaries of mining companies, mining engineers, U. S. deputy mining surveyors, and all persons interested in mining, are earnestly requested to assist in the collection of this information. Blank tables, in convenient form, applicable to quartz mining, will be furnished by W. A. Skidmore, Mr Raymond's agent, whose address is box 1513, San Francisco. Parties furnishing information will receive due credit in the Mining Commissioner's Report (unless they desire such information to be considered as confidential), and will be entitled to a copy of the report, which will be forwarded as early as possible after publication. Three blanks are sent to be filled out. One for description of leading mines, another for detailed operations of leading mines, and another the statement of quartz mills. The questions asked concerning the operations of leading mines are as follows: County and district; name of mine; owners; number miners employed; miners' wages; cost of sinking and drifting per foot; cost of stoping, mining and milling; company or custom mill; number of tons extracted and worked; average yield per ton; percentage sulphurets; total bullion product reported by whom, etc.

It is to be hoped that miners receiving the circulars will take the trouble to fill out the blanks as well as they can. The questions are few and simple, but when the answers are received from all over the State it will assist the Commissioner in preparing tables and information of great interest to the community at large as well as the miners themselves. All the blanks have been prepared in such a manner as to give as little trouble as possible to those who answer the questions; and want of time is no excuse for not answering them. In previous reports, where certain districts and certain mines have been left unmentioned, considerable fault has been found, while it was totally the fault of the people of the district in question, in not answering the circulars. Our Mining Commissioner's reports, being official reports by the Government are looked upon, especially in foreign countries, as authoritative, and the information derived from them is considered more reliable than that from any other source. It therefore behooves all miners who want their mines represented in the Government report to pay some attention to the requests of the Commissioner.

Oyster Culture.

Oyster culture, like many other valuable arts, is a very ancient one. We have very full and particular records of its practice even by the early Romans, who were at least the first people of which we have any record that paid much attention to this bivalve, or prized it as an article of food. This people, with the growth of their cities, early saw the necessity of employing means for prevanting the extinction of the oyster, and for increasing the supply. The elder Pliny has left us an exceedingly interesting and instructive account of the habits and nature of the oyster, and of the manner in which it was artificially cultivated in his day.

With the decline of the Roman power this industry, with many others, seems to have become neglected and almost forgotten until the increasing population of England and France, and the returning tasts for the bivalve, once more set people to thinking and devising ways and means to aid nature in keeping up a supply commensurate with the constantly increasing demand for it. As a result we now find the self-same appliances devised by the Romans largely employed in the very localities formerly occupied by them, as well as many other places along the shores of France and England—piles driven into the ground near the sea-shore, with boughs of trees and fascines interwoven as places of lodgment for the young oyster or "spat," as it is called.

Fifteen or eighteen years ago, the rapidly advancing price of oysters in the chief cities of France and England, consequent upon the increasing scarcity, notwithstanding the rude methods of assisting nature, as above alluded to, led to the invention and adoption in this country, as well as in Europe, of still more carefully devised plans, which have been minutely described in works treating upon this subject, but to which we have no space here to more than make this mere allusion.

Our principal object, at this time, is to call attention to one of the latest American devices in this direction—a California invention, exhibited during the first few weeks of the Mechanics' Fair in this city, but afterward transferred to the State Fair at Sacramento, where, as well as here, it attracted much attention. We allude to the invention recently patented through the SCIENTIFIC PRESS Patent Agency, by Dr. B. F. Lyford, of this city. This seems to be almost the *ne plus ultra* of invention in this direction, and is especially adapted to this coast.

It is well known that a full grown oyster will produce an immense number of eggs—estimated at from one to two million; but it is well known that hundreds if not thousands are destroyed where one comes to maturity. It has been ascertained that the proportion of loss on the Pacific coast is much larger than at the East, owing, in all probability, to a larger number of devouring enemies here than elsewhere.

When a young oyster leaves the parental fold it is not larger than the point of a pin, and is provided at first with an apparatus for swimming; but it moves mostly with the drift of the tide or current for several days, at the end of which time, if not destroyed, it fixes itself to some object near the bottom—as a stone, stick or other shell. If no such object is encountered, it is destroyed or carried out into deep water and lost. The object of Dr. Lyford's invention is to provide a safe and convenient place for the lodgment of the young oyster and for its growth until out of danger from its enemies, when it may be taken up and put into a suitable locality for reaching maturity. To accomplish this purpose the doctor provides a bulkhead or dam across the mouth of an estuary or artificial enclosure, the bottom of which shall be so paved or otherwise prepared as to admit of its thorough cleansing at low tide, and in which may be arranged the sticks, stones, shells or other desired places of lodgment. When so prepared the water is admitted at flood tide through self-acting valves opening inward, which close when the ebb commences, and which are protected by fine screens, to prevent the ingress of any enemy to the young spat. During the ebb tide the water is drawn through the bulkhead by a floating scoop valve, so arranged as to take water from the surface only, while that near the bottom, and in which the spat are mostly found, remains undisturbed until agitated and changed by the next in-coming tide. By this device, to all appearances, the young oyster may be kept perfectly safe during the first stages of its growth. Indeed, actual experiments near Sancelito have fully proven the practicability of the device.

It appears to be reasonably held that by this device oysters may be even more readily raised than by any other known artificial device. The doctor exhibited his invention in the essterly gallery of the Pavilion, as already alluded to, by a working model, whereby the whole process was made perfectly intelligible, daily, to great numbers of visitors, whose curiosity led them to examine it.

MINERS at Stickeen, working for wages, get $10 per day, but it is a hard country to live in. The price of supplies has, however, been reduced one-half since the rush. Some men who came early are working ground which pays as high as $100 to the man, but the country is overrun with disappointed miners.

United Workingmen's Exhibit of Furniture.

Near the southeast corner of the gallery of the Mechanics' Pavilion was shown the elegant furniture, made by the Pacific United Workingmen of San Francisco. It consists of two chamber sets, one writer's cylinder bookcase, one book-case, one side board, one fire screen, and one patent extension table. The book-case and writing-desk combined is five feet wide and nine feet high, of walnut, beautifully carved and finished in French walnut, very conveniently arranged with drawers and pigeon holes. The book-case is a handsome piece of furniture, finished in French walnut, tastefully ornamented by carving, five feet wide and eight feet high. Both these bookcases can be taken apart to facilitate moving. The side board is a handsome piece, as fine as any in the market, richly carved, finished with round corners and raised and recessed panels. It is of French walnut, five feet long and eight feet high. The extension table is a very convenient dining table. It is the invention of one of the company, and is patented by them. Its superiority consists in greater ease of handling than is the case with other tables, and in its neat appearance. Its peculiarity is in the manner in which the leaves are put away, viz: under the table, without being the least in the way. The fire screen is a work of art, made by one of the firm. The frame consists of a wreath of grape vines with fruit and leaves. It is intended as a frame for silk chenille work and is certainly beautiful and elaborate.

The designs are all the work of different members of the firm. The display reflects the highest credit on the company and adds much to the display of furniture at the Fair. Visitors remark that this furniture is not only beautiful in design and finish, but also useful and substantial.

All this furniture was manufactured at the company's works on Brannan street, between Sixth and Seventh. A visit to the factory proved interesting, showing the rapid growth of a needful and important industry. It consists of three departments. The first floor is devoted to machinery, with brick engine room in the rear. The second floor is the manufactory proper, where the furniture is put together by the cabinet makers. On the third floor are the varnishing and finishing departments. The company is now erecting another building as large as their present one, which will double their capacity. It is intended for a wareroom, packing and carving shop, etc. They now employ about sixty hands and will add thirty more within a month. Each workman is a shareholder, and consequently interested in the success of the enterprise, thus insuring faithful and honest work. The firm is composed mostly of sturdy, industrious Germans. They make all kinds of furniture, case work as well as frame work. It is the worthy aim of this incorporation to stem, as much as possible, the tide of Eastern importations, and by making a superior article oblige people to support home industry.

SALMON.—The Government Salmon Breeding Works, on the McCloud river, are receiving large orders for supplies of salmon eggs with which to stock the streams of the country. The orders from the different States for these eggs have reached the camp from Washington, and are as follows:

Maine	100,000	Pennsylvania	400,000
Vermont	50,000	Maryland	500,000
Massachusetts	200,000	Michigan	700,000
Rhode Island	100,000	Wisconsin	100,000
Connecticut	500,000	Minnesota	250,000
New York	250,000	Iowa	250,000
New Jersey	250,000		

Besides there are the States of Virginia, Indiana and Illinois, and Utah and Colorado, which have not reported.

QUICKSILVER IN TULARE COUNTY.—If prospectors keep at work, it is likely that quicksilver will be found in every county in California before the year is over. Tulare is the latest county heard from on the quicksilver question. Mr. E. H. Kerrick, of Porterville, has shown the Visalia *Delta* the croppings of a discovery in quicksilver, taken from the hills in the vicinity of that place, which indicate a richness worthy of further investigation. The sample shown exhibited the usual spar accompaniment, and led to the discovery. The *Delta* says: The discoverer informs us that the croppings indicate large deposits of ore. We should judge from what we saw that the ore is likely to prove of unusual richness and value.

JUDD & CROSBY'S works, Colorado, have made a trial run and turned out several fine bricks, several thousand dollars, from tailings and common ore. Every portion of the works has proved a perfect success, and the run has demonstrated that there is no failure to be apprehended in any respect whatever.

PARTIES are prospecting in the hills to the westward of John Lawley's Berryessa ranch for copper, many floating specimens of ore having been picked up.

THE Virginia and Truckee railroad is in excellent order throughout its entire length, and trains are running on time to all points.

THE Baltic mill on East cañon, Utah, has started up.

Crow Blackbirds.

The crow blackbird, or "Boat-tailed Grackle," shown in the accompanying engraving, is an inhabitant of the Southern States, to the maritime portions of which it is more particularly attached. It abounds in the southeastern low grounds of Florida, and in those of Georgia and South Carolina, as well as in the Sea Islands of the Atlantic coast, as far north as the Carolinas, beyond which none are to be seen. These handsome birds are gregarious at all seasons of the year, and are often seen in very large flocks. They seek for food among the large salt marshes and their muddy shores, and in rice plantations as soon as the grain is fit to be eaten by them. In autumn they frequently resort to cornfields and ploughed lands of plantations, interspersed with ponds or marshy places, returning towards evening to the salt marshes, where they perch in immense flocks

CROW-BLACKBIRD.

amidst the tall marsh grass. Their food consists principally of small fiddler crabs, insects of various kinds, ground worms and seeds, especially grain. They frequently seize on shrimps and other aquatic animals of similar nature which have been left on the beach by the tide.

These birds begin to mate in February, at which time the plumage of the male displays its richest hues of glossy black, with reflections of steel blue, dark violet and green. Their nests are often built quite near each other, upon branches of the smilax, the nest of a previous season always being reclaimed by its former occupants, who repair it. A new one, however, is promptly constructed of the long fibred Spanish moss that dangles from every tree, dry twigs, withered grass and dead leaves. One brood is reared every season and the aquabs are excellent eating. The flight of the grackles is high and protracted in decided undulations of 40 or more yards. They move in loose flocks and are shy and wary. Probably a third of these birds, in the Carolinas and Georgia, remain during the winter, associating with the fish crow, alighting on stakes in the mudflats near the cities. They are also fond of the company of cattle, but never enter the wood. The males frequently attack birds of other species driving them from their nests and sucking their eggs. When wounded, if not disabled, they retreat with alacrity; when overtaken they defend themselves by biting and scratching, often causing the blood to flow from the hands of their captor. They are courageous and formidable, not unfrequently giving chase even to turkey-buzzards and hawks.

EMBALMING.—At the late Mechanics' Fair Dr. Lyford exhibited a very curious apparatus for embalming bodies. In the operation the body is placed in an air-tight casket, through which an attachment is made to some important artery, and the communication carried to the necessary chemical apparatus outside, which is very ingeniously combined with an air pump, so arranged as to effect the double purpose of exhausting and giving a powerful pressure for injecting chemicals through the veins and other portions of the body. The exhaustion of the air from the casket has the effect of filling out the features and figure of the subject to a most startling resemblance to life. The substance injected converts the flesh of the entire body to a kind of horn-like consistency, apparently as imperishable as marble. We have seen bodies embalmed by Dr. Lyford many months after death, which still present a most life-like appearance, giving indubitable evidence of as permanent a power to resist decay as an Egyptian mummy 3,000 years old. We doubt whether it is within the reach of science to effect a more perfect process of embalming than that invented and practiced by Dr. Lyford, to the efficiency of which thousands of people in this city can attest from knowledge derived from the examination of the great number of bodies which he has embalmed. We may add that the process is simple and not very expensive.

AUSTRALIAN MINES.—Latest advices from the Australian gold fields generally are encouraging, although during the early part of last month work was much impeded by the cold and wet weather which almost continuously prevailed. There is a still further increase of paying areas and most valuable discoveries, while the old workings still remain remunerative.

THE Washington quicksilver mining company, Napa county, reduce 100 tons of ore per month with an Almaden furnace. They get 18 pounds of quicksilver to the ton, and are now turning out 24 flasks per month.

California Coal.

We see that the *Stockton Independent* pitches into Professor Whitney and Dr. Cooper of the State Geological Survey, because Dr. Cooper is reported by the *Alta* as having said certain things about coal which he never did say. The *Alta* contained a very brief summary of Dr. Cooper's remarks on the subject before the California Academy of Sciences, and then got the thing so mixed that Dr. Cooper was entirely misrepresented. The Doctor made some very sensible remarks on California coal, stating that every day or so the papers mentioned the discovery of beds of coal, with indications of being rich. He went on to explain that in 99 cases out of 100 these discoveries were of no value, and he is probably correct. But he did not say that "no coal exists on the Pacific slope in paying quantities." He said that "geologists had long considered the coal found here as lignite, but practically it was as good as much of the older coal—at least that of Bellingham bay, Coos bay, and Mount Diablo." He spoke of the coal beds of Ione valley and Amador county, giving some details concerning the mines there and speaking of the geological formation. In speaking of the frequent discoveries, he said that the prospectors sometimes found small streaks of lignite, of little value, because there was seldom enough of it to furnish any supply. Our miners make a mistake in considering it like metallic veins, and supposing that by following it down it would surely widen out. The coal belongs to stratified formations only, and has been deposited in horizontal layers, and if not found so has been lifted up by volcanic action, so we find it always in seams or layers. If it is found of a certain thickness at the surface, it is likely to continue at that thickness.

There is very little *true* coal on the Coast. The coals from England, etc., are distinguished from those of modern formation, the latter being called lignites. He said that the best coals on this coast, first classed as lignites, are so compact and so near true coal that they are just as useful. At Coos Bay the grain of the wood that forms the coal can be seen with the naked eye. On this coast the remains of trunks of trees of the same family that exist now, are found in the coal. The coal itself does not differ in nature very much from some of the older formations. Its age is only distinguished by the fossils and remains of plants, which are very reliable. The valuable coals of the Coast belong to the top of the cretaceous formation. There is a question as to some of them, as to whether they do not belong to the Pliocene. In regard to the cretaceous beds themselves they are often of little value because there is not enough of coal. When less than two feet thick it is not much good, and ought to be of good quality, and at least four feet thick to pay to work. Some claims are now being worked or prospected that will never pay. The coal is of good quality, but there is not enough of it.

These are some of the points made by Dr. Cooper on the subject of California Coals. We gave a pretty full synopsis of his remarks in our last week's issue, and they will repay perusal. Several of our contemporaries are commenting on what he said from a false standpoint, having taken a garbled report as a basis. In our report, by the way, the types made the doctor say that "true pliocene terracea do not exist at lower levels around the bay," when he said they "do exist."

MOST of the mines on Little Cottonwood, Utah, are making preparations for winter, such as building houses and other necessary buildings, getting in supplies, etc., and it is supposed there will be nearly as much work done in the mines through the coming winter, as there is at present.

A SHAFT is to be sunk at the Imperial mine, at Virginia City, to the depth of 4,000 feet. An engine of 500-horse power will do the pumping and hoisting. When completed, it will be the deepest bore on the continent, and, with one exception, the largest in the world.

THE new air-shaft at the Belcher mine has cooled off the 1,000, 1,100 and 1,200-ft. levels to such an extent that the miners can work on either of them comfortably without taking off their shirts.

THEY are having a grand excitement about coal and coal mines down at Dayton. Claims are being located all along El Dorado cañon, wherever the tertiary sandstone appears.

OVER 5,000 Chinamen are mining in the lava-beds near Oroville. They send over $25,000 in gold dust every week to the San Francisco mint.

WHEN the Nevada and Colfax railroad is completed, a first-class stage line will be put on to run from Nevada City to Downieville, and intermediate points.

THE concentration works of the Terrible Co., Colorado, are now in successful operation in all departments, and are capable of treating 40 tons per day.

A good deal of prospecting for new lodes is being done in Clear Creek county, Col.

JOHN R. CONNORS has been chosen President of the Gold Hill Miners' Union.

Cinnabar, Lake and Calistoga Districts.

A correspondent of tha Napa *Reporter* gives tbst paper an account of a two weeks' trip in the mines embracing all tha country that lies in Cinnabar, Lske and Calistoga districts. This belt is 20 miles in langth, running northaast and sonthwest, snd tha width none can tell, ss it seems to widen out all tha time, new discoveries being msda evary dsy, and as these mines hava becoma a positive fact, tha paopla can with ssfaty call them minas. I will commence on the Hog's Bsck at tha Missouri; this was located some thrae years ago by a lot of Calistogians, and prospected sufficiantly to sstisfy tham that thay had a mine, but being unable to work it to an sdvantsge, they sold to parties in San Francisco, Wm. A. Stawart being tha principal purchaser. A bench of thraa retorts was arected last winter, and notwithstanding tha dissdvantages of a wat wintar, and no roads, over tan thonsand dollars' worth of quicksilver wss taken out in tha winter months. This spring two large retorts ware added to the others, and a larga forca of men amployed, but for soma causa tha profits ware not as larga ss formarly. Abont July 1st, a ganaral discharga took place from tha superintendent down to the Chinasa dish-washer, and tha mina was placed in charga of a naw set of man; sinca then quite a lot of quicksilvar is shipped avery waak. Tbara can ba no doubt but tha Missouri ia a big mine, bnt it is tha opinion of a great many man, who profess to ba axperts, that all tha work that has been dona was done on a alide, and tbat the main ledge is highar up tha mountain. Last week Pap Hopkins want up the hill and commencad prospacting and found good ora. It is genarally conceded thst rock will not float up hill, but often doaa tska a run down hill. You will no doubt haar of soma grand rasults from old Missouri, as thara can be no doubt but thay hava gona to work in tha right placas. Lesving hera wa pass over the Pig's Back about one-hslf mila, and arrive at tbe Oakland—formarly called the Lost Ladga. The mine was discovered by our old friend, J. L. Cook, of Yountville, wbo, with otbers, located it, and workad it until this last spring, whan ha leased it to Messrs. Roberts & Robinson, of Santa Clara.

Thase parties incorporated under the name of the Oakland Quicksilvar Mining Co., and went to work, ereoted bnildings and put up a bench of thrae small ratorts, from which they have takan an immense amonnt of qniokailvar. They have taken out as high as 24 flasks per week, and that I suppose will beat any other mine in America. Thase threa retorts do not hold over 500 pounds of rock at a tima. There are thouaands of tons of rich ore on the dumps, and more being takan out every day. Tbis company intends erecting a large furnace this fall. Stock in this mine is very high and in demand. Just balow this is the Gayser mine, owned by Edgar Mills, Mr. Friedburg, S. B. and C. A. Agers and others. Nothing bnt prospecting has been done on thia mina until racently owing to other claimants coming in and laying claim to the mine, and in fact, a snit had baen commenced, but I understand that these old claimants have been subsidized and preparations are now going toward building a furnace and working the mine on a large ecale. Next in ordar ia the Emma, owned by F. E. Johnston and Dr. Pond, of your city, and Lucky Bill Whitton. Miss Emma is proving herself second to none, and her owners feel sanguine that thay have a rich mine, and thare oan he no doubt of the matter, as tons of rich ore lie upon the dumps, and hundreds of tons more are in sight. I did not learn what the company's intentions were in regard to building furnacas or retorts, but prasume thoy will, as thare is ore enough in aight to pay them all their expenses, and a good dividend beaides. Jnst below thia ia the Webfoot, owned by Maasrs. Cyrus Hopkins, Nash and Walker; not enough work has been done here to show whether there is a mine or not, but they have good indications. Next in order is the Kantuck, ownad by the same company that owns tbe Missouri. This mine is now being worked and a larga amount of rich ore has been taken out and hauled to the Missouri for retorting. A good wagon road has baen built from this mine to the Healdsburg and Geyser Toll Road; four tunuale have been run here and good paying ore has been found in all.

Mining ann Lumber Interests in Nevana County. — We are indebted to Mr. Fenton, agent of H. G. Langlay'a Pacific Coast Diractory, for the following itama in raference to the quartz minas in tbis county. There are 60 mills for the raduction of gold-bearing quartz and cemant, located as follows: Grass Valley township 24, Nevada 14 (hesidea several that are at preaent idla), Eureka 6, Washington 4, Little York 2, Bridgeport 7, Bloomfaild 1, Rough and Ready 1, Meadow Lake 1. There ara saven metallurgical works, locatad, four in Grass Valley township, 2 in Nevada township, and one in Meadow Lake townahip. The total cost of these in round nnmbers is in the neighborhood of 1,250,000. Forty-two of these mills are run by staam and 25 by water power. There are 27 aaw milla in the county, located aa follows: Meadow Lake township 7, Navada township 6, Grass Vallay township 4, Washington towuship 1, Little York township 2, Eureka township 3, Bloomfield townahip, 4. The total cost approximates $354,000.—*Nev. Transcript*

The smallest circnlar saws in use are those employed in the manufacture of gold pens, and are only hslf an inch in diameter.

Conduction of Heat.

In a racent lectnre Dr. Gnthrie said: Heat travels from point to point in spsce threa ways: 1st, by conduction; 2d, by convection; and third by emsnation or radiation. It moves by conduction when tha body whioh raceives the heat doea not mova as a whole, but allows the heat to traval tbrough it. Heat moves by convection, when a hot body moves. It moves by radiation when a hot body gives off heat into spaca or into soma medium wbich doas not intercapt it. The gradual heating from and to end of a poker in the fira illustrates tha first of thasa metbods, tha flight of a red hot cannon ball the second, and tha roasting of meat or the solar heat tha third.

Metals, as a class, conduct heat batter thsn any other class of bodias. Hence, when both are abova blood heat, matals feel hotter than wood. When below, they feal colder. So tbat paper is scorched when heated in contsct with wood, but not so easily when in contact with copper. Hence, also, lead may be melted in paper. Amongst the metals silvar and copper ara pra-aminent. That coppar conducts heat better than iron is shown by heating rods of the two at a plana of contact, and noting tha malting of fragmanta of wax arrsngad along tha two. The great conducting power of matals is shown by tha cooling affact they hava npon tha mixad gaaes of a burning body. The metal withdraws so much heat from tha gas in its naighborhood that combustion is impossible. Tha miner's lamp is based npon thia principle.

Liquids condnct haat ss a claas worsa than solids. Tha conducting power of liquids is maasurad by haating the uppar surface of a film of liquid, and noting tha axpansion of tha air in a chambar upon whose uppar side the liquid film resta. Tbe more complex tha composition of the liquid is, tha more opposition does it present to tha passage of heat by conduction. Chlorina, iodina and bromina are espacially strong in rasisting haat condnction. Watar is by far tha bast conductor amongat non-metallic liqnids.

Gasas are far worse conductors than liqnids, and the imperfect condition of many solids is due to the gases, generally air, which they inclose in their pores or batwaen the fibers. Clothing thns protects the body from loss of haat in cold weather and from the scorohing heat of the snn in hot weather. A red bot ball may be carriad in the hand if a mass of asbestos, which incloses the air, is interposed. Hydrogen oonducts heat far bettar than other gases, and accordingly cools bodies in contact with it with great rapidity.

Bull Run Mines.—Bull Run mining distriot, says the *Silver State*, ia situatad on tbe headwaters of the Owyhee river, a tributary of Snake river (marked on old maps Lewis' Fork of the Columbia) something over ona hundred miles northeast of Winnemucca. Silver ore was firat discoverad in thia district four years ago by some packers who were running a pack train from the railroad to Silver City, Idaho. These packers discovered and located the Blue Jacket ledga, and shipped sevaral tons of the ore to Reno. Bnt, as has been the case with nearly all mining districts remote from railroad oommunication, prospecting ceased for a time in Bull Run, and work was suspended on tha Blue Jacket, one of the most promising claims in the district. This summar a reaction has set in; the Blue Jacket has become the property of an English company, and has been developed sufficiently to warrant the arection of a mill for the reduction of its ores. The machinery for the mill has baan orderad from San Francisco, and Reinhart Bros., of thia place, have been instructed by the superintendent of the Blue Jacket gold and silver mining company to forward the same with all possible dispatch to its destination. The machinary weighs sixty tons, and it will ba ahipped immediately. Besidea this 35,000 faet of lumber haa been ordered by the company, which will also be ahipped from tbie point. There is a good road from Winnamucca to Bull Run, and freight by this route is one-half cent per pound less than from any other point on the railroad, which in itself is considerable of an item.

Nickel ann Cobalt.—The Rockland Nickel Mining Company have recantly developed a new mining property in the Highland mountains on the silurian Potsdam sandstone formation, in Rockland county, New York, which promisea to be of graat importance to consnmera of nickal and cobalt, as they will soon be large producers of these matala, from tbeir extensive and wall defined vein, which is easily traced in its conrse for more than one and a half miles by its aurface outcroppings; it is 18 faet in hreadth where a shaft has been snnk, and 1,000 tons of ore have already been taken out. Tha vein contains, in a gangue of quartz, feldspar and hornblende, copper glance, millerita, linnaita and magnetic pyrites, the average depth of which ia 256 feet above watar drainage, an nnlimitad qnantity of rich yielding nickel, cobalt, and copper ore that oan be easily minad and delivarad at Grassy Point, on the Hudsou, for smelting or shipping.

Street lamps may be lit automatically by a naw patent obtained by a Mr. Wilaon, by having two burnera on the lamp, one of which is small and kapt burning constantly. Whan the gas pressure is raised, a small gas holder on the top of the column is elevated, affording a passeaga for the gas to the larger of the two tips, which is lighted by a small jet.

The Oakland Mine.

The developmants in the Oskland mina, in this county, place Cinnabar district in the first rank of the qnicksilver prodncing sections of this State. Tha recant rich "discovery" makes all connected with the mina of intarest. On tha 18th of March, tbe Lost ledga, as it was than called, was laased to its prasent superintendent, E. Robinson, for two yaars, for tha sum of $225 per month, with tbe privilega of purchasa dnring tha first yesr for $30,000, or dnring the second for $40,000. Robinson let E. W. Roberts have a half interest, snd they incorporated tha mine as the Oaklsud quicksilver mining compsny. Of the 300,000 shares 5,000 were reserved as a pnrchssing fnnd. Work was commenoed on tha 10th of April with a force of four or five men. They now work a forca of 40 man, hsva six ratorts in operation, and are producing 100 flasks of metal a month. Tha main tunnal is into the hills 113 faet, from which drifts hava been run east 36 feet. They have in operation a crnsher, run by steam-power, with a capscity for crusbing 100 tons in 24 hours. Thera ia also complata 400 feat of railway from the tnnnal to tha ratorts. Tha ora in the ledge, which is 10 feat wide, is of tbe richast charactar of cinnabar, running from 15 to 50 per cent. metal. Tha walls of tha ledga ara well defined, and the clay lining appaars batween the ledga and both tha nppar and lowar walls. In the centar of the vein tha ora is richast, running in places as high as 60 per cent. Thara ia avary indioation of an inexhanstible supply. Tha prasant davalopmant is snfficiant to placa the Oakland in tha first rank of tha quickailver minaa in this Stata. Splandid specimens from thia mine are now on axhibition at the Petaluma fair. Tha superintendant, Mr. Robinson, is one of tha most practical and anargatio man in tha district, and is withal a most agreeabla gentlemsn.—*Sonoma Democrat.*

Fair Returns.—Hirschman, Grovar & Co. about four years sinca pnrchasad tha gravel claim known as the Gentry claim. They were not very wealthy when they made the purchasa; had, in fact, we bolieve, to borrow monay for that purposa. Thay have made a run of five months this summer, employing during the time from fonr to six men. They have completed the clean-up for the saason, and find the proceada to be $26,000. Thia may be considered a very fair return for the money invested. They have paid for tbe diggings, and will have $10,000 or $12,000 hesidas. Next year tbey will without donbt be abla to take out $40,000. This is only one instance of success in mining enterprise in thia vicinity during tha last two years. Every mine that is touched seams to pan out bayond the expectation of the proprietors. And the indication now is tbat the next yaar will be the most prosparous ever known. If there is plenty of water ao that the gravel mines will be enabled to make a long run, there is no donbt of its being bettar evan than the preaent. The qnartz minea already opanad, and tbose being developed, will make the returns surpass thosa of any former year.—*Nevada Transcript.*

Paradise Mining Distriot.—This new district, which was discovered by Allen M. Sadorns, an old resident of this county, is situated about twenty-five milas from Winnemncca, in the range of mountains which separataa Paradisa from the valley of the Hnmboldt. Rich gold quartz and silver orea have baan discovered in the district, which is attracting considerable attention at prasent. James Herndon, a resident miner of the district, informs us that a great many claims have bean locatad, thraa of which are being systematically developed. Two of these, the Credit Mobilier and Rob Roy, are rich in gold, and the other, the Gov. Flanders, is rich in silver. A spacimen of gold-bearing qnartz from the Cradit Mobilier, shown us by Herndon, is about one-third gold, and, thongh small, is eatimated to contain twenty dollars in pure gold. The silvar ore is of tha Stetafaldtite variety, and a piaca from the specimen shown us assayed $450 to the ton. The veine as far as developad are from one to four feat thick, and atand naarly vertical in slate and granite formations. The Rob Roy was bonded last week by tha owner, Alex. McGregor, to G. M. Ogden, formerly interested in the Richmond mina at Eureka.—*Silver State.*

Mendocino Cure for Snake Bite.—The Ukiah *Dispatch* has the following: Charley Kall, who nsad to slaughter Ukiah's beaf and mutton, haa just returned from Humboldt county. He brings with him quite a curiosity in the shape of a hnga swollen and discolored arm. It happened thns: In getting over a brush fenca, a mila from the house he was going to, he mnst have placed his hand on or near a coiled rattlesnaka. Immadiately after it bit him he felt the poison commence to affaot his whole system; his tongue and lips grew thiok and almoat useless. On reaching the house, however, he made known his troubla. A sheep was soon killed and a hole cut in the warm oarcass, into which Charley thrust his arm. This gave considreable reliaf, and that aoma of the poison was extracted aeemed avident by tha inside of sheep soon becoming green. After this, ponltices of tobacco, onions, graase, etc., were applied. He traveled on horseback down to Ukiah, though it was not a very pleasant trip nnder the circumstances.

The Nevada City *Transcript* aays that the ahipment of gold by express from that city, last weak, was the largest for any similar length of time during the last 10 years.

Omega Mining and Water Company.

This mine is locsted at Omega, in Washington township, and is situated on Omega hill, which has been workad continuously since 1853, or 16 yesrs prior to tha prasent ownarship. R. W. Tully, of the Bsnk of Nevada connty, and others are the presant ownars. Tha Omega Mining and Water Co. have owned a portion of tha mines on the hill for five years, but recantly hava becoma owners of all tha mining ground thera. During tha ownership of fiva yesrs, they hava taken out gold dust to tha amount of $389,941.50, and by other parties dnring the same time, $164,000, making a total in fiva years of $553,941.50. For tha 16 yaars of working prior to the preaent ownership, it is impossibla to tell tha exsct amount of gold extracted, but from tbe extant of ground washed away, it mnst approximata nasr a million of dollars. There yat ramaina some 20 yaars' supply of gravel to be washed away—evan with the prasant superior appliances for mining. This ground is equally as good, if not batter than any yat worked, and is much mora easily and cheaply moved. The presant season was a vary short ona, owing to the excessively cold wintar. Thay commancad piping tha 1st of April, which gava barely six months, sgainst eight months as an ordinary season; yet the gross yiald is about $95,000 for this aaaaon. Tha mina ia now just in good working condition. Anothar saason a much bettar run can ba mada, aven during the sama length of time. The figuras abova given prova tha valua of tha mina. This mina, lika many others in the county, is not for sale, becsusa it pays better to work it.—*Nevada Transcript.*

Express Ranch Mines.—Tha *Idaho Statesman* says: Mr. C. W. Dukaa is from Expraas rsnch, Oregon, and says that buainasa ia looking up considarably in that vicinity. Captain Myric and Milton White are moving their 10-atamp quartz mill from Gam city, Eagla Creek district, to Conner Creak district, 16 miles northeast of the Express ranch, and ara putting it on the Eddleman mine. On another portion of this mine are two 5-stamp mills; one has run 18 months and the other just atarted. This mine is five feat wide and pays well. On Granite mountain, commonly known as Rye Valley diatrict, 12 miles southwest of tbe Express rancb, is a 5-stamp mill on the Madison ledga, which has been rnnning thrae months with good results, belonging to Gilohrist & Davidson. Cbarles Grean located two ledges in this district five years ago, the Green discovery, and Monumental, and has recently negotiated with Pierson & McDonald, of San Francisco, for a 20-stamp steam mill, whereby they all become equal partners in the mill and ledga. Tha mill was purchased in San Francisco and is now on tha way. The lumbar is on tbe gronnd and 20 men are at work putting np the mill. Mr. Grean has shipped sevaral tons of this ora to Swanaea, through an English company, and after paying all expensas it nettad him $190 to the ton. These are silver ledgas, and the 20-stamp mill will have all tha appliances for reducing silver. Mr. Durkee saya tbare are 600 men in Amelia city, Mormon basin and Rye valley, all at work.

Benicia Tanneries.—The old Benicia tannery, owned by Masars. Brown & McKay, is running on full time, turning out 700 sidea of leather par week, with a lahor force of twenty-five men; 100 aides of this leather are used evary waek hy the Vallejo boot and shoe factory. The last steamer for the Oriant took 35,000 pounds of leather for Japan. This Benicia tannery has furnished ona-fourth of the above amount, and has a standing order of 15,000 pounds per month for the same market. This tannary waa started eight yaars ago by Messrs. Brown & McKay, on a cash capital of only $700, and today their working capital exceeda $50,000. The new tannery of Messrs. Moore & Cummings is in snccessful operation, working soma twenty-five men, and is capable of turning out 400 aidea per waek. It ia one of the most completa tanneriea in the State. Its capacity is to ba increasad to forty men and 800 sides of leather per week. Massrs. Brown & McKay will next naxt spring double the present capacity of their tannery by adding a new two-story bnilding, 60x100 feet, with new enginea and mschinery. —*Vallejo Independent.*

The Patterson mine at Tuttletown, says the Tuolumne *Independent*, will soon receive increasad facilitias for working. At the Sonora fonndry is a naw six-inch shaft, 8 ft. 4 in. in lengtb, with flanges, for the new 35-ft. water wheel. They ara also just finishing up two friction wheels, weighing 1,500 pounds, for the hoisting works, together with the boxes, cape and sliding boxes. There are already thrae watar wheels in oparation—one at the mill and two hurdy-gnrdys—nsing tha same stream of water, which runa from ona to the other; a large one for the hoisting works will make the fourth, which will soon be in operation.

Miner's Candlesticks.—Gillig, Mott & Co., of Sacramento, exhibit at the State Fair a aafaty mining candlestick, known aa Stevanson's patent. It is provided with a self-acting apring, so that whan the candle bnrns down in the socket, instaad of dropping through on to the gronnd, and thus run tha riak of satting fire to the timbers, thia spring ents off the wick and extinguishes the light. The patent is the rasnlt of inveatigation to prevent snoh calamities as not long aince occurred in the mines at Gold Hill, and tha exhibitors atate that it is coming into general nse in all the mining districts of the Pacific coast.

ASSIGNEES' SALE IN BANKRUPTCY.

NOTICE IS HEREBY GIVEN THAT THE UNDERsigned, under and by virtue of the power and authority vested in them, and by virtue of an order of the District Court of the United States for the District of California, made and entered on the 16th day of September, A. D. 1874, in the matter of the MENDHA SILVER MINING COMPANY, Bankrupt, will sell at public auction, in the city and county of San Francisco, at the auction saleroom of John Middleton & Son, No. 310 Montgomery street, on

Friday, the 23d day of October, A. D. 1874

At 12 o'clock, M.,

All that certain mining and mill property and premises situate in Highland Mining District, near Ploche, State of Nevada, described as follows, to-wit:

One twenty-stamp mill and machinery, together with the appurtenances belonging to the same and necessary for the proper working thereof;

Also, the mill site and the spring known as Mendha Spring, and the tract of land surrounding the same to the extent of twenty (20) acres;

Also, all the water-pipe connecting the springs with said mill;

Also, the buildings, office, stable, hoarding-house, etc., upon said land and adjacent to said mill;

Also, the "Stetefeldt" furnace in said mill;

Also, the following named mines, to-wit:

Mendha Mine;
Mendha West Extension Mine;
Regent Mine;
Arizona No. 2 Mine;
Chief Mine;
Crown Prince Mine;
Sadowa Mine;
Alaska Mine, and
Mendha East Extension Mine;

Also, the hoisting works, machinery and all other appurtenances connected with said mines, mill and premises.

Said property is known as the Mendha Mill and Mines.

Terms of Sale—Cash in U. S. gold coin: ten per cent. on fall of hammer, balance on confirmation by U. S. District Court.

For particulars respecting this property apply to the undersigned, at their respective places of business, and to J. M. SEIBERT, Agent of Wells, Fargo & Co., at Ploche, Nevada

Dated San Francisco, September 17, 1874.

WILLIAM A. SCOTT, JR.,
At Wells, Fargo & Co.'s, San Francisco.
And HENRY O. HYDE,

THE NEW WINCHESTER REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.

The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fira Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandraka with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Livar, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from Internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

[Continued from Page 213.]

HALE & NORCROSS.—The cross-cuts to the north and south on the 2,000-ft. level are being steadily advanced. The main incline is sinking rather slower than heretofore.

CHOLLAR-POTOSI.—The daily yield is 100 tons of ore of the average assay value of $30 per ton. The two cross-cuts in the Belvidere section are looking more enconraging than heretofore.

FAIRMOUNT.—Work has been resnmed on this mine—adjoinging the Baltimore on the north—and they have arranged with the Baltimore Consolidated company to commence a drift at the 750-ft. level to run through and prospect the Fairmount.

IMPERIAL-EMPIRE.—The main south drift on the 1,850-ft. level is being pushed rapidly ahead with six-hour watches.

SUTRO.—The usual good progress is being made in the tunnel. The rock continnes soft, and there is a considerable flow of water from the face of the tunnel.

BALT. CONS.—They are now engaged in putting in the bob for a plunger pump at the 900-ft. station.

EUREKA DISTRICT.

BULLION SHIPMENTS.—*Sentinel*, Sept. 24: The Ruby Consolidated company yesterday shipped 61,100 lbs. of bullion to Palissde by Pritchard'e teams. Same paper of 25th says: The Hoosac company yesterday shipped 20,078, and the Ruby Consolidated company 20,295 lbs. of bullion, by Pritchard's teams to Palisade. The latter company also shipped 11,900 lbs. by way of Elko.

FIRE. — The woodwork of the Richmond fume srrester was again on fire yesterday. It will be in running order in a day or two.

BEING BUILT.—The iron stack of the Eureka Consolidated fnme srrester is being built, and will be completed in a few days.

TYBO BULLION.—Fourteen thousand pouuds of bnllion, from the 2 G mine of Tybo passed throngh town yesterday for Palisade. 60 tons of bullion have been shipped from Tybo to Palisade. It will pass through town to-morrow to its destination.

RE-STARTED.—The furnace at Tybo, shut dowu for a few days past for wsnt of coal, has been re-started. Enough coal-burners have been obtained to furnish the requisite amount of coal.

ELY DISTRICT.

STILL MORE.—Pioche *Record*, Sept. 22: The Washington & Creole is still producing pay ore in considerable large quantities. Last week we reported a large shipment of bullion. Yesterday we saw three large bers of bullion, amounting in value to $3,600, which form a very good commencement for the week.

WHITE PINE.

STRIKE IN THE MAMMOTH.—*White Pine News*, Sept. 26: From superintendent Sam. Paul, we learn the gratifying intelligence that an important development has been made in the Mammoth company's mine on Treasure hill. At a distance of 560 ft. from the face of the tunnel, at a depth of 200 ft. from the surface, a face of mineral was encountered, which further development has shown to be from 8 to 10 ft. in width, and assayiug all the way from $500 to $1,000 per ton.

Arizona.

MINING NEWS.—*Miner*, Sept. 18: The miniug news from every sectiou of the Territory is as favorable as the best friends of Arizona care to heve it. Within the last week, over $4,000 in gold has been brought to Prescott, by miners who have recently cleaned up their srrastras. Noyes' 10-stamp quartz mill will be ready for work inside of uext 10 days. Bill Smith's 10-stamp mill near Wickenburgh, is running night and day. At leest $3,000 in gold found its way to Wickenbnrg, last week. We are in hopes of seeing three more quartz mills runuing in this county ineide of three monthe. In Mohave county, Col. David Buell, the Keystone and other companies are rushing matters.

Colorado.

ITEMS.—*Prospector*, Sept. 19: Messrs. McCleary & Co. have diecovered a new gold region on the head waters of the San Juan river, 12 miles eoutheast of the Summit.

A CORRESPONNENT from the Summit saye that many of the prospectors have completed their 10-ft. shaft, and have gone out nntil the next season.

BULLION.—*Register*, Sept, 23: The bulliou ehipmente throngh the banks this month to date, foot up $87,000 in gold, and $11,000 in silver, or a total of $98,000 for three weeke, or nearly $33,000 a week or $5,500 per day. Thie does not include any of Hill's shipmente, which are very large, but have been sent down to the fair at Denver for exhibitiou. They amonnt to $65,000.

Montana.

BANNOCK.—*Independent*, Sept. 14: Scarcity of water hae caused a suspension of work in Greeter & Co,'s bar diggings, and not more than eight or ten companiee are at work on the bar diggings.

YAM HILL.—A gentlemen who came over from Yam Hill a day or two since, informs us that there are but a few companiee now workiug their mines at that place in cooneequence of the short supply of water. In the early spring it was thought there wonld be an abundance all the season, but the rain melted the snow and it dieappeared in a few days. Theee minee have paid well all the season and promise to do so for years.

Utah.

DRY CANON ORE. — *Tribune*. Sept. 23: We have been shown by Mr. M. D. Lsmb, of Dry Cañon, who arrived in this city yesterdey, some concentrated ore from the concentrating works owned by himself and Dr. Coleman. The ore has been run down to $921 silver, $152 gold to the ton, and 47 per cent. lead.

EMMA.—Cor. *Tribune*, Sept. 22: Lsst Wednesday, T. W. Parks, attached the Emma for about $100,000, which caused considerable excitement. The works have been all closed and keepers appointed. The men have received their checks, and many of them have left camp in search of their fortnne elsewhere. It is uncertain when the Emma will again start up, bnt it is generally supposed it will remain closed till text spring. The closing of this mine will have a slightly depressing effect on business in Alta, but it will not be as perceptible as some may suppose, for the men employed at that mine were but a small portion of those at work in the camp, and as long ae we have such mines as the Ohio, Fnller, Vallejo, Prince of Wales, Flsgstaff, Victoria, Imperial, City of Rocks, McKey and many others of less note, and they continue to pan out as they now do, we will live and flourish.

Prepayment of Newspaper Postage by Publishers.

During the last days of the last session of Congress was passed a law authorizing the prepayment of postage on newspapers and other publications, particularly periodicals, upon some simple system to be devised by the Post-office Department. In order to expedite matters, the Postmaster-General was specially directed to prepare some plan. The work was placed in the hands of Third Assisant Postmaster-General Barhour, with full authority, subject only to the revision of the Postmaster-General. General Barhour at once set to work, and puzzled himself for some time before he devised a plan, which he has now partially arranged. He arrived in this city three days ago with A. D. Hagen, chief of the stamp division in his bureau, for the express purpose of obtaining the views of Postmaster James and others on the practicability of the system he has arranged. While the system is completed, all the details are not yet fiuished. New stsmps have yet to be devised, and General Barbour will consider them before returning to Washington and obtain estimates for having them printed. The system he has devised is simple. It provides for the preparatiou of receipt-hooks by the Department for esch publisher of a newspaper or periodical. The form of receipt at the New York Post ffice will be somewhat as follows:

(Name of newspaper.)
Date.
No.—.
Amount —.
.....
Stamps.
.....

No. — NEW YORK, —.
Received ——dollars and ——cents postage on —lbs newspaper publications at two cents per lb.
——, Postmaster.

The receipt book will be retained at the Postoffice, where the newspapers will be weighed. The stubs of the receipt book will serve as memoranda to the Postoffice of sums paid, from which returns to the General Department are made. The stamping of papers in bulk will not require more than four stamps of different denomiuations to make up the amount of postage paid by the publishers on any package, whatever that amount may be. Even on a ton of newspaper matter, on which the postage will be forty dollars, only the four stamps will he required to make up the amount of postage paid. This stamp system has been devised, as the Act of Congress requires the use of adhesive stamps. The stamps will be affixed to the stub of the receipts, by the Post-office clerk, and then cancelled.

Thus the publisher will be saved the trouble of bnying and affixing stamps. After the law goee iuto effect, he will take his receipts and hold them as evidence that the postege was paid. General Barbour expects to save by this system of paymeut thousande of dollars to the Treesnry Department every year, besides saving to the department and publishere much labor. He has exhibited the plan to Postmaster-General Jewell, who approves it in every respect. When the details are completed, a circnlar will be issued by the Department explaining the system, copies of which will be forwarded to the newspaper and publishing honses, and to the four thousand postmasters throughout the Statee, and on the let of Jannary next the change will be made.—*N. Y. World.*

GOLN RUN.—Holt's mill, in Gold Run district, ie rnnning steadily on ore from Picard'e mine, near Greggsville. The ore is chloridized by roasting in a reverberatory furnace at the mill, previous to amalgamation. Two or three miniug companiee are working vigorously on their mines in thie district.—*Silver State.*

TO BE DISMANTLED.—The Gold Hill *News* saye that a number of workmen are engaged at preeent in taking out the machinery of the Imperial mill, situated a short dietance below the Gold Hill foundry. Thie mill, it will be remembered, ie one of the oldest in the State of Nevada.

PANAMINT.—Eucouraging reports are coming in from the Panamint minee. The camp now numbere over 500 inhabitants, and the promise of big things crop ont largely—if we are to helieve one-half of the things that appear in the sonthern papers.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Waahington, D. C., Sept. 29th, 1874.

FOR WEEK ENDING SEPT. 15TH, 1874.*

PENOIL SHARPENER.—John S. Hall, S. F., Cal.

HORSE HAY-FORK.—Edmnnd Harrison, Hollister, Cal.

CORRLESTONE PAVEMENT.—Philip Zadig, S. F., Cal.

TRACK CLEANER.—Thos. C. Chnrchman, Sacramento, Cal.

MACHINE FOR PUNCHING SHEETS OF METAL.—Thos. H. Drury, Wheatland, Oregon.

TRADEMARK.

FOR CATARRH REMEDY.—Norman S. Coon, S. F., Cal.

*Tha patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

THE Phœnix Quicksilver mine employs 60 men. They reduce 18 tons of one per cent. ore a day in a Knox & Osborne furnace, and the total cost of working, mining, etc., is six dollers per ton of ore. The mines are yielding about 80 flasks of quicksilver per month.

A NUMBER of Chinamen *en route* to Panamint, Inyo county, under a contract with Stewart, Jones & Co., ran away on reaching Los Angeles. They probably got wind of the threats to prevent them from working in the mines at that place.
